On behalf of the New Jersey Department of Environmental Protection (Department), the Department concurs with the location of proposed competent bedrock monitoring well 114-MW75D per the email below. As discussed during the April 4, 2024 technical meeting, PPG is required to confirm hydraulic

connection between 114-MW72D and 114-MW75D using a combination of packer testing and hydraulic monitoring methods similar to those used in January 2024 to confirm the hydraulic connection between monitoring well 114-MW66D and monitoring wells 114-MW73D and 114-MW74D.

Thank you.

***** External Message *** -- PROBE message before clicking links or opening attachments.**

As discussed during the meeting, attached please find a figure with the proposed location for a competent bedrock monitoring well to be installed in the Lockatong Formation to complete delineation of total chromium south of monitoring well 114-MW72D. Please review the proposed well location and provide any comments or approval of the location.

Best regards,

To: Schuele, Frederik; Zervas, Gwen [DEP]; Amin, Prabal; Curtis, Ian (Ian.Curtis@dep.nj.gov); VanEck, David [DEP]; 'Mark Pietrucha'; Costa, Ralph; Krall, Scott M; Steve Faeth (sfaeth@ppg.com)

Subject: PPG - Technical Meeting to Discuss Groundwater RIR Addendum for Bedrock
When: Thursday, April 04, 2024 1:00 PM-3:00 PM (UTC-05:00) Eastern Time (US & Canada).
Where: Microsoft Teams Meeting

Agenda

1. Review results of the packer testing program recently completed at the site. This program was implemented pursuant to the agreed-upon scope of work discussed during the October 19, 2023 technical meeting.
2. Confirm NJDEP agreement to submit the final RIR for the bedrock water-bearing zone. The RAWP for the bedrock water-bearing zone will be submitted separately at a future date TBD.

Proposed location of competent bedrock well 114-MW75D

Map Sources:

1. New Jersey State Plane North American Datum 1983 Coordinates, U.S. Survey Feet.
2. Vertical Elevations are in North American Vertical Datum of 1988 (NAVD88), U.S. Survey Feet.

Notes:

1. Data used to develop the interpreted top of bedrock surface were obtained from historical investigations conducted by PPG and Public Service Electric and Gas Company (PSEG), borings and monitoring wells completed by PPG as part of the groundwater Remedial Investigation (RI), and a geophysical survey (seismic refraction) completed as part of the groundwater RI.
2. Bedrock elevations are in feet NAVD88.
3. Concentrations are presented in units of micrograms per liter (µg/L).
4. Bold and shaded value indicates the concentration is greater than the NJDEP GWQS of 70 µg/L for total Cr.
5. Sample depths are relative to the top of the well casing (PVC for monitoring wells, steel for open borehole bedrock wells and FLUTe ports).
6. Groundwater analytical results are from unfiltered samples (total fraction), except as noted with (T) for total fraction and (D) for dissolved (field-filtered) fraction.
7. For each well, the most current results for each sample depth interval are presented.

Abbreviations:

Cr = total chromium
$Cr^{+6}$ = hexavalent chromium
D = Dissolved fraction
FD = field duplicate sample
ft = feet
GWQS = NJDEP groundwater quality standard
J = Indicates the result is an estimated value; the associated numerical value is an approximate concentration of the analyte in the sample.
JB = The analyte concentration is greater than three (3) times, but less than or equal to ten (10) times the concentration in the associated method/prep blank. The presence of that analyte in the sample is considered "real." The concentration is quantitatively qualified (JB) due to method blank contamination.
N = normal environmental sample
NJDEP = New Jersey Department of Environmental Protection
RA = The sample result was rejected but still considered usable.
T = Total fraction
U = Indicates the analyte was not detected in the sample above the laboratory reporting limit.
UB = The analyte concentration is less than or equal to three (3) times the concentration in the associated method/prep blank. The presence of the analyte in the sample is negated (UB) due to laboratory contamination. The presence of the analyte in the sample is negated (UB) due to laboratory contamination.
ug/l = micrograms per liter.
UJ = Indicates the analyte was not detected above the laboratory reporting limit and the reporting limit was approximate.

Bedrock Elevation (feet): 0, -20, -40, -60, -80, -100, -120

Thank you for your time today. As discussed, attached please find a plan-view and cross-section presenting the proposed location and scope of work associated with the new competent bedrock well (114-MW81D) to be installed to complete the bedrock Remedial Investigation (RI). We also discussed that ongoing monitoring at 114-MW72D will continue to track Cr concentrations at this well. And lastly, we agreed that extrapolation of the 70 ppb Cr contour in bedrock beneath 114-MW72D is appropriate for completion of the bedrock RI, based on the data at nearby wells.
Dave Van Eck – Please provide your concurrence on the proposed location and scope of work for 114-MW81D.

Sent: Monday, December 2, 2024 10:37 AM
To: 'Costa, Ralph'; VanEck, David [DEP]
Cc: Hastings, Brianne J
Subject: RE: PPG - GA Group Sites Bedrock RI Drilling Program

Dave and Ralph – Thank you for meeting with us on 11/26/24 to review the packer testing procedure. As discussed, the proposed approach characterizes the 25-foot open borehole interval at 114-MW81D by staggering the packers at 5-foot intervals. Therefore, we will implement the program as proposed. Note that this work is scheduled for 12/4 to 12/5.

Report Suspicious

Frederik,
Thank you for clarifying. Your approach is not consistent with the sequencing provided in the Department's groundwater guidance. Although I don't object to your sequencing at 114-MW-81D, I would not recommend it. The goal is to demonstrate hydraulic connection, but your approach carries some risk of unintentionally inflating packers over bedding plane fractures that the geophysics might identify and be connected to 114-MW-72D.
Thank you,
Ralph

Hi Ralph. I don't think I said that. We discussed doing borehole geophysics before sampling the well, but not before packer testing. We did not do borehole geophysics before packer testing at 114-MW73D and 114-MW74D. We just did packer testing at 5-foot intervals within the open borehole, and that is the plan for 114-MW81D.

Frederik,
The summary provided below looks good. I have one addition regarding sequencing of the scope. You clarified that if the borehole remains open, the geophysics would be conducted after well development and before packer testing. I agree this would be prudent, so we don't inadvertently inflate packers where the geophysics suggests conductive fractures may be.
Thank you
Ralph

*** External Message *** -- PROBE message before clicking links or opening attachments.

Thank you Dave and Ralph for your time today, it is much appreciated. Please let me know if you agree with the summary below, or if you have any questions or additions.

To summarize, we discussed the scope of work for installation of well 114-MW81D. The original scope is shown below.

Scope of Work

- Install new bedrock well 114-MW81D 60 feet south of 114-MW72D with open borehole from 100 to 125 ft bgs
- Develop well
- During well development and pump test, continuous water level monitoring at 114-MW72D and 114-MW76D
- Packer testing at 114-MW81D at 5-foot intervals (25-foot open borehole, 5 intervals)
- During packer testing, continuous water level monitoring at 114-MW72D and 114-MW76D
- Borehole geophysics at 114-MW81D
- Groundwater sampling at 114-MW81D (vertical profiling at 5-ft intervals)

Based on the nature of the rock observed thus far (to 100 ft bgs), it may not be possible to complete 114-MW81D as an open borehole well. If that is not possible, we discussed the option of installing a 2-inch PVC well with filter pack to keep the borehole open. For such an installation, we agreed to forgo the 5-ft packer testing program and borehole geophysics. A pump test with up to 1 hour of pumping at 114-MW81D would be performed to evaluate for hydraulic connection with nearby by wells 114-MW72D and 114-MW76D. Water levels at these wells will be monitored with pressure transducers. We are still proposing to conduct vertical profiling of 114-MW81D at 5-ft intervals to characterize groundwater quality and to delineate chromium concentrations downgradient of 114-MW72D.

Ralph inquired about packer testing in the 2-inch PVC well, suggesting that this could be performed to isolate the upper and lower portions of the well and perhaps provide more definition on which portion of the boring is hydraulically connected to 114-MW72D or 114-MW76D. This topic was discussed but no decision was made. Ralph suggested that further discussion on this topic be deferred, pending results of the pump test at 114-MW81D.

Best regards,

Subject: PPG - GA Group Sites Bedrock RI Drilling Program

Hi Dave and Ralph. This is a quick update for the bedrock drilling program at the PPG site in Jersey City. We are drilling the boring for installation of well 114-MW81D, to complete the bedrock RI. Top of bedrock was encountered at 71.5 ft bgs. Today the crew advanced the borehole to 100 ft bgs. The target depth interval for the open borehole well is 100-125 ft bgs, therefore we are going to set and grout 6-inch steel casing at 100 ft bgs. Drilling/rock coring will continue inside the 6-inch casing tomorrow. The boring will be terminated at 125 ft bgs.

The rock thus far has been mostly highly weathered with very little structure (broken up pieces of rock within a sand/clay matrix, see photos below). If this continues to target depth, we may not be able to finish this boring as an open-borehole well due to the likelihood of the rock caving in and filling the borehole. Instead, we would build a 2-inch PVC well with filter pack to keep the borehole open. We will know better as drilling continues tomorrow.

If we need to build a PVC well, this will not allow for completion of the packer testing program that we discussed. The presence of hydraulic connection at 114-MW81D with the other two nearby bedrock wells (114-MW72D and 114-MW76D) would have to be evaluated via a pump test. Since this is a deviation from the scope of work we discussed earlier this year, we would like to discuss this option with you should it become necessary. To that end, would you be available for a call to discuss tomorrow afternoon? Please let me know if this works for you and what time is best. I think a 30 minute call will suffice.

Best regards,

11/19/24

Report Suspicious

Hello Frederik,
Ralph and I looked at the documents and we are in agreement with your proposed sample intervals for 114-MW81D.
David

Subject: [EXTERNAL] PPG - Borehole Geophysical Log and Recommended Sample Intervals for 114-MW81D
Good morning Ralph and Dave. Attached please find the borehole geophysical logging report for bedrock well 114-MW81D and a separate file denoting the proposed sample intervals and supporting data. 114-MW81D is an open-borehole bedrock well with 6-inch steel casing set to 100 ft bgs and the open borehole interval extending from 100 to 125 ft bgs.
We are proposing a total of 5 samples targeting the following intervals:

- 103.5 ft btc: Major fracture at 103.2 ft btc with minor flow into and up the borehole under pumping conditions from 103 to 104.3 ft btc.
- 107.5 ft btc: Fracture interval from 106.5 to 108 ft bgs with major fracture at 107 ft btc and minor flow into and up the borehole under pumping conditions from 106.1 to 109.2 ft btc. Sample targets section with largest Acoustic Caliper aperture.
- 115 ft btc: Major fractures at 114.7 and 115 ft btc.
- 123 ft btc: Bedding plane at 123.2 ft btc with possible minor flow into or out of the borehole based on the fluid conductivity data from 122.9 to 124.2 ft btc.
- 127 ft btc: Minor fracture at 127 ft btc. Serves as vertical delineation point for boring.

We are prepared to collect the samples during the week of 1/13/25 to 1/17/25, pending your concurrence. As done previously, samples will be collected using low-flow protocols. Please let me know if you agree with the proposed sampling program.
Best regards,

Environmental Protection
P.O. Box 420
Trenton, New Jersey 08625

**Groundwater Remedial Action Progress Report, 4th Quarter 2024**

**Garfield Avenue Group Sites, Jersey City, Hudson County, New Jersey**

On behalf of PPG, AECOM has prepared this remedial action progress report (RAPR) to describe the activities conducted in the fourth quarter (Q4) of 2024 (i.e., from October 1, 2024 through December 31, 2024) related to the groundwater remedy for the Garfield Avenue (GA) Group Sites (Project Area) (**Figure 1**), which is part of the Hudson County Chromate (HCC) Sites located in Jersey City, New Jersey (NJ).

Between 2010 and 2022, PPG conducted soil remedial activities to remove or control exposure to impacted fill, thereby eliminating the risks to public health and the environment. Over 1,100,000 tons of waste have been excavated from ground surface to the depth of the naturally-occurring, competent meadow mat present over most of the Project Area. The competent meadow mat functions as a chemical barrier that maintains a reducing environment in the subsurface as well as a physical barrier due to its low permeability. In 2017, PPG began implementation of *in situ* remedies for the intermediate and deep water-bearing zones (referred to as the overburden). The New Jersey Department of Environmental Protection (NJDEP) approved the remediation strategy for the shallow, intermediate, and deep water-bearing zones as outlined in the GA Group Groundwater Remedial Action Work Plan (RAWP) for the Project Area in January 2022 (AECOM, 2022). The approved remedy for the shallow, intermediate, and deep water-bearing zones includes a combination of *in situ* remedies, engineering controls, and institutional controls, which are supplemented by robust monitoring programs. The *in situ* remedies in the overburden target hexavalent chromium (Cr[VI]) in groundwater at concentrations greater than 1,000 micrograms per liter (µg/L), where practicable, using a combination of anaerobic bioprecipitation and chemical reduction alternatives to treat or reduce concentrations of Cr(VI) and other contaminants of concern in groundwater.

On May 5, 2023, PPG received a letter from Assistant Commissioner Dave Haymes regarding groundwater at the GA Group Sites. The letter titled "*Outstanding Tasks Remaining on Garfield Avenue Group Ground Water Remedial Action"* (referred to herein as the "Haymes Letter") (Haymes, 2023) identified 12 items that must be addressed to the NJDEP's satisfaction for the agency to approve the groundwater Remedial Action Report (RAR) and PPG's application for an Active Category Remedial Action Permit – Ground Water (RAP-GW). PPG provided responses to four of the items listed in the Haymes Letter related to the Groundwater Remedial Investigation (RI) Report/RAWP Addendum, in a letter from Mark Pietrucha, NJ Licensed Site Remediation Professional (Woodard & Curran), to Assistant Commissioner David Haymes (NJDEP) on June 30, 2023 (Pietrucha, 2023).

On September 8, 2023, PPG submitted the draft GA Group Groundwater RAR (AECOM, 2023), which provided documentation of remedy progress through Q2 2023 as well as responses to the remaining eight items in the Haymes Letter (Haymes, 2023). NJDEP's comments on the GA Group Groundwater RAR were received on January 10, 2024 and included a request for pilot studies to be implemented for the impacted portions of the basal till and bedrock; during a meeting with the NJDEP on February 26, 2024, PPG agreed to this request.

The Site 114 Basal Till Injection Work Plan and Bedrock Injection Work Plan and associated Discharge to Groundwater Permit-by-Rule (DGW PBR) applications were submitted to the NJDEP on March 15, 2024 (AECOM, 2024a; AECOM, 2024b). Meetings were held with the NJDEP on April 12 and April 23,

2024 to discuss the submitted plans (referred to herein as the Basal Till DGW PBR and Bedrock DGW PBR), which were subsequently approved by the NJDEP on May 16, 2024 (NJDEP, 2024a; NJDEP, 2024b). Well installation, well development, groundwater sampling, and injection activities were initiated during Q2 2024 in accordance with these work plans. The Basal Till pilot injection test took place from June 13, 2024 to June 26, 2024, while bedrock injections began on July 11, 2024 and continued in Q4 2024. Monthly groundwater monitoring in the basal till and bedrock treatment areas continued in Q4 2024.

On May 31, 2024, NJDEP sent an additional correspondence (in the form of comments on the Q4 2023 RAPR) (NJDEP, 2024c) that provided an assessment of the status of the issues raised in the Haymes Letter (Haymes, 2023). NJDEP requested contingency remedy implementation in the "Recalcitrant Phase II Northern Area" (Q4 2023 RAPR Comment #1; herein after referred to as the Phase II Recalcitrant Area) and the "Recalcitrant Area Near Carteret Avenue" (Q4 2023 RAPR Comment #2; hereinafter referred to as the Phase I Recalcitrant Area). NJDEP requested that additional Hydraulic Profiling Tool/vertical aquifer profiling (HPT/VAP) investigations be conducted in the recalcitrant areas to evaluate potentially applicable contingency measures.

On June 13, 2024, PPG sent an email responding to NJDEP's May 31, 2024 comments. Further discussions among Subject Matter Experts (SME) for PPG, NJDEP, and the city of Jersey City were held via a series of online technical meetings. During SME meetings held on June 24 and 25, 2024 and July 18, 2024, the conceptual scope of the HPT/VAP investigation program for the Phase 1 Recalcitrant Area and the Phase II Recalcitrant Area recalcitrant areas was discussed and agreed upon.

On August 21, 2024, NJDEP sent a correspondence (in the form of comments on the Q1 2024 RAPR) (NJDEP, 2024d) regarding yellow water observed during the Q2 2024 well installation activities. SME meetings were held in September to discuss this correspondence, and these discussions are referred to herein as the "Phase I Yellow Water Discussion".

On September 5, 2024, NJDEP distributed a revised comprehensive list of items that need to be addressed for the Project Area (referred to herein as "September 2024 List of Outstanding GA Group Groundwater Issues") (NJDEP, 2024e). This revised list is meant to supersede previous lists of issues provided by the NJDEP for the Project Area and consolidate remaining items to be resolved. On September 20, 2024, PPG distributed a summary of the status of each item and proposed date for completion (PPG, 2024a). On December 23 2024, PPG revised the status of each item based on the progress made in Q4 2024 via email (PPG, 2024b).[1]

On December 31, 2024 a Draft HPT/VAP Investigation Work Plan (AECOM, 2024d) was submitted to the NJDEP, documenting the scope of work to conduct additional investigation in the Phase I Recalcitrant Area, the Phase II Recalcitrant Area, and in the area where yellow water was observed during Q2 2024 well installation activities (Additional Contingency Area).

The table below summarizes the technical meetings held during Q4 2024 to advance the progress of the project and collaborate with NJDEP on the Project Area remedy. Previous SME meetings held were summarized in the Q3 2024 RAPR (AECOM, 2024c).

| SME Meeting Date | Topics Discussed |
|---|---|
| 10/2/2024 | Meeting to Discuss PPG's 9/20/2024 Responses to NJDEP's September 2024 List of Outstanding GA Group Groundwater Issues. |
| 10/10/2024 | PlanEngage Demonstration and C3 Soil Depiction Discussion (Item #3) |

[1] The list was also revised at the Department's request on January 27, 2025. PPG and NJDEP agreed that future updates to the list will be made on a quarterly basis and included with the RAPR Refer to Appendix E for an updated List of Issues through March 5, 2025.

| SME Meeting Date | Topics Discussed |
|---|---|
| 10/16/2024 | September 2024 List of Outstanding GA Group Groundwater Issues (Item #1) - Demonstration of Groundwater Remedy Effectiveness. |
| 10/22/2024* | Basal Till and Bedrock Remedial Action Status/Status of September 2024 List of Outstanding GA Group Groundwater Issues. |
| 11/20/2024 | 114-MW81D Bedrock Well Scope of Work (Item #6) |
| 11/24/2024 | 114-MW81D Bedrock Well Drilling Status and Packer Testing Approach (Item #6) |
| 12/9/2024 | Revised Cross-Sections – C3 Soil Depiction Discussion (Item #3a) |
| 1/2/2025 | Groundwater Sampling Intervals at 114-MW81D (Item #6) |

** Attendance list was extended to include to external stakeholders for the NJDEP, the city of Jersey City, and PPG.*

In addition to summarizing the activities completed in Q4 2024, this RAPR discusses issues encountered, deviations from the NJDEP-approved DGW PBRs (NJDEP, 2017; NJDEP, 2019; NJDEP, 2021; NJDEP, 2024a; and NJDEP, 2024b) or NJDEP-approved GA Group Groundwater RAWP, samples collected (along with analytical data tables, figures, and supporting appendices), and work planned for the next quarter. Monitoring and remediation well information and construction details are presented in **Table 1**.

As of Q4 2024, the progress of the remedy with respect to Cr(VI) concentrations is summarized below:

| Water-Bearing Zone/Area | Wells With Cr(VI) <1,000 µg/L | Reduction of Volume of Cr(VI) >1,000 µg/L Plume Compared to Baseline |
|---|---|---|
| Shallow | 42 of 42<br>**100%** | 100% |
| Intermediate | 108 of 124<br>**87%** | 85% |
| Deep | 49 of 58<br>**84%** | 81% |
| Bedrock | 25 of 28<br>**89%** | 93% |

The approximate total volumes of reagent and potable water injected within the areas where active injections were occurring in this quarter and through Q4 2024 are summarized below. Bedrock total volumes are calculated through January 3, 2025, the last day of bedrock injections.

| Area | Gallons Injected in Q4 2024 | Total Gallons Injected |
|---|---|---|
| Phase III Target Area 2 | 567,000 | 3,406,800 |
| Bedrock | 267,500 | 412,237 |
| Basal Till | 13,460 | 18,300 |

# 1. Work Conducted During Reporting Period

## 1.1 Project Area-Wide

- A site-wide groundwater elevation gauging event was conducted November 11 through November 12, 2024. **Figures 2A, 2B, 2C, 2D, 2E, and 2F** depict groundwater potentiometric surface maps for the shallow water-bearing zone, intermediate water-bearing zone, deep water-bearing zone, the lower deep zone, the basal till, and weathered bedrock, respectively.
- Monthly groundwater monitoring was conducted at up to 39 wells to evaluate where active treatment is ongoing; monitoring occurred from September 30 through October 9, October 16, November 4 through November 8, November 13 through November 15, December 2 through December 11, and December 18, 2024 in accordance with the Phase III (AECOM, 2021), Basal Till (AECOM, 2024a), and Bedrock DGW PBRs (AECOM, 2024b). Operational injection wells showing active treatment areas during Q4 2024 are identified in **Figures 3A** through **3F**.
- Quarterly groundwater monitoring at six wells located in the Eden Wood property and Pacific Avenue was conducted on October 7 and 8, 2024 and December 10, 2024 in accordance with the Phase III DGW PBR.
- Quarterly post-treatment groundwater monitoring at up to 82 monitoring wells took place from October 8 through October 16, 2024 and November 14 through November 22, 2024. Injection operations in these areas are complete and monitoring is performed to evaluate the *in situ* remedy in accordance with the Phase II (AECOM, 2019) and Phase III DGW PBRs (AECOM, 2021). As of Q4 2024, eight rounds of post-treatment monitoring have been completed for monitoring wells in the Phase II area (refer to Phase II DGW PBR; AECOM, 2019). This area will transition to the Enhanced Attenuation groundwater monitoring program in 2025.
- Quarterly groundwater monitoring to evaluate the limits of the total chromium (Cr) plume across the Project Area was conducted in Q4 2024 by sampling an additional 29 wells on November 19, November 21, and December 11 through December 17, 2024.
- Groundwater monitoring to evaluate the FerroBlack®-H reactive zones established in the southwest quadrant of Site 114 was completed at nine wells during Q4 2024.
- Quarterly groundwater monitoring at 5 basal till wells was conducted on November 20, 2024 to evaluate conditions outside of the basal till treatment area footprint.
- Quarterly groundwater monitoring at 10 bedrock wells was conducted from December 13 through December 18, 2024 to evaluate conditions outside of the bedrock treatment area footprint.
- Removal of dense non-aqueous phase liquid (DNAPL) present in select monitoring wells in the Southeastern Area of Site 114 (114-P2-MW-10I/D and 114-P2-MW-12D) was conducted prior to collection of groundwater samples. DNAPL thicknesses ranging from 4 feet (ft) to 11 ft were recorded at these wells and a total of approximately 50 gallons of DNAPL was recovered. Removal of DNAPL was also conducted at one monitoring well in the former Halsted property (HSTD-P3-MW002I-B). DNAPL thickness in this well ranged from 2.5 ft to 9 ft and a total of approximately 50 gallons of DNAPL was recovered.
- Additional NJDEP-requested field investigations for the bedrock water-bearing zone were initiated on November 14, 2024. As part of these investigations, bedrock monitoring well 114-MW81D was installed on November 21, 2024 and developed on November 22, 2024. A pump test was conducted at 114-MW81D on November 25, 2024, and packer testing was conducted from December 4 to December 6, 2024. Baseline sampling for this well is scheduled for Q1 2025.
- On December 17, 2024, Borbas Surveying, Inc. surveyed bedrock well 114-MW81D.
- No wells were decommissioned this quarter.
- Communications regarding redevelopment of the Project Area continued in this quarter.

### 1.2 Site 114 (Phases I, II, III, Basal Till, and Bedrock)

- Injections at well 114-PW-02T (basal till) recommenced on October 23, 2024 and continued through the end of the Basal Till DGW PBR period (i.e., December 6, 2024).
- Injections in the bedrock, which began on July 11, 2024, continued at up to 11 injection wells through the end of the Bedrock DGW PBR period (i.e., January 3, 2025).
- Degradable organic carbon substrate (i.e., molasses) was pulsed into the bedrock and basal till for up to 6 hours per day on weekdays. Overnight injections of potable water occurred based on field conditions (i.e., groundwater elevations and injection wellhead pressures). Groundwater gauging was conducted, and wellhead pressures were measured, throughout each injection day to monitor conditions and mitigate the risk of potential surfacing. Figure 3E identifies basal till and bedrock injection wells that were operational during the quarter.

### 1.3 Halladay Street, former Halsted property, and Eden Wood Property (Phase III, Target Area 2)

- Injection operations continued in Q4 2024 at up to 36 remediation wells within the intermediate water-bearing zone of the Halladay Street and Halsted area.
- Degradable organic carbon substrate (emulsified vegetable oil [EVO] and molasses) was pulsed into the formation for up to 6 hours per day on weekdays based on field conditions (i.e., groundwater elevations). Overnight injections of potable water occurred based on field conditions (i.e., groundwater elevations and injection wellhead pressures). Groundwater gauging was conducted, and wellhead pressures were measured, throughout each injection day to monitor conditions and mitigate the risk of potential surfacing. Figure 3B identifies which intermediate water-bearing zone injection wells were operational during the quarter.
- Sixteen injection wells were transitioned from calcium polysulfide (CaSx) reagent to molasses reagent in October 2024. Potable water only was pulsed into the formation at these locations for up to 8 hours per day on weekdays based on field conditions (i.e., groundwater elevations) through October 25, 2024, prior to beginning molasses injections.
- In Q4 2024, 16 wells received molasses and 28 injection wells received EVO.

## 2. Treatment Status for Reporting Period

- Volumes of reagents and potable water injected into operational Phase III target areas in Q4 2024 (i.e., as of December 31, 2024) are summarized below. **Table 2** provides operational summaries on a well-by-well basis for Phase III.
    - In Target Area 2 (Halladay Street, former Halsted property), 567,000 gallons were injected in Q4 2024, for a total of 3.407 million gallons injected since start-up (105% of target volume).
- Volumes of reagents and potable water injected to progress the bedrock and basal till remedies in Q4 2024 are summarized below. **Tables 3a** and **3b** provide operational summaries on a well-by-well basis for the bedrock and basal till, respectively.
    - In bedrock, a total of 267,519 gallons was injected in Q4 2024, for a total of 412,237 gallons since start-up.
    - In basal till, a total of 13,461 gallons was injected Q4 2024, for a total of 18,328 gallons injected since start-up.
- Figures 3A, 3B, 3C, 3D, 3E, and 3F depict the following for the shallow water-bearing zone, intermediate water-bearing zone, deep water-bearing zone, lower deep zone, basal till, and bedrock, respectively, for Q4 2024:
    - Injection wells where operations were ongoing during the quarter;

  - Wells sampled and where Cr(VI) concentrations were less than or greater than 1,000 µg/L;
  - Wells sampled and where Cr concentrations were less than or greater than the NJDEP Groundwater Quality Standard (GWQS) for Cr of 70 µg/L; and
  - Figures 3A, 3B, and 3C also depict the inferred limit of Cr greater than the GWQS based on data collected in Q4 2024.

- **Table 4** provides a summary of Cr(VI) and Cr groundwater analytical results for wells in the Project Area with a comparison to baseline concentrations.
- Remedy progress relative to concentrations of Cr(VI) in groundwater is illustrated in plan-view on **Figures 4A** through **4F**, in cross-sectional view on **Figures 5A** through **5I**, and in three-dimensional view on **Figure 6.** These figures include two datasets:
  - Baseline: provides a representation of Cr(VI) concentrations prior to operation of the groundwater remedy; and
  - Progress: provides a representation of Cr(VI) concentrations based on the most recent groundwater analytical results at each monitoring location, which are indicative of prevailing conditions in response to implementation of the groundwater remedy.
- Data used to generate Figures 3, 4, 5, and 6 are presented in **Appendix A-1**, which provides groundwater analytical results for Cr(VI), Cr, and geochemistry parameters through Q4 2024.
- Per the GA Group Groundwater RAWP (AECOM, 2022), a localized tetrachloroethene (PCE) plume in the shallow water-bearing zone on Site 199 was actively treated via *in situ* injections. Bioaugmentation with a *Dehalococcoides* consortium was performed in July 2023. Groundwater samples are collected quarterly from three shallow wells and one intermediate well on Site 199 for analysis of PCE and its breakdown products (i.e., select chlorinated volatile organic compounds [CVOCs]). Analytical data for Q4 2024 for these compounds are presented in **Appendix A-2**.
- Analytical results from quality assurance (QA)/quality control (QC) samples for Cr(VI), Cr, and geochemistry, and CVOCs are presented in **Appendices A-3** and **A-4**, respectively.
- Time-series trend plots depicting concentrations of Cr, Cr(VI), total organic carbon (TOC), sulfate, and geochemical indicator parameters (dissolved oxygen [DO] and oxidation-reduction potential [ORP]) are presented in **Appendix B-1** through **Appendix B-6**. Appendix B also includes a reference guide for interpreting these parameters and their applicable target ranges for evaluating the influence and effectiveness of groundwater treatment.
- As requested by the NJDEP, statistical analysis (Mann-Kendall trend test and linear regression) was conducted to assess trends in Cr(VI) concentrations at select monitoring wells where treatment has been completed and where concentrations of Cr(VI) greater than 1,000 µg/L were detected in at least one of the past four sampling events. Results of the statistical analysis are presented in **Appendix B-7**. Of the 19 wells evaluated, five (5) wells exhibited a decreasing trend, one (1) well exhibited an increasing trend, and eight (8) wells exhibited no trend. Five wells did not meet the data use objectives of the test; therefore, no trend analysis was performed for these wells.
- Well documentation for bedrock well 114-MW81D installed during Q4 2024 is included in **Appendix C**. Decommissioning records for bedrock wells 114-MW73D and 114-MW74D are awaiting pin access from NJDEP prior to submittal. Both wells were decommissioned on May 6, 2024.
- **Appendix D** consolidates technical evaluations pertaining to the bedrock injections.
- Deuterium (inert tracer) analytical results from samples collected as part of the basal till and bedrock baseline, injection, and performance monitoring events are presented in **Appendix E**.

- An updated status to the September 2024 List of Outstanding GA Group Groundwater Issues is provided in **Appendix F**.
- Responses to NJDEP comments on the Q3 2024 RAPR are included on **Table 5**.

# 3. Progress of the Groundwater Remedy

## 3.1 Cr and Cr(VI)

### 3.1.1 Site 114 (Phase I, II, and III)

*Shallow Water-Bearing Zone*

- In the shallow water-bearing zone, five monitoring wells were sampled for Cr and Cr(VI) in Q4 2024 (Figure 3A, Table 4).
- In Q4 2024, Cr(VI) concentrations at the five shallow monitoring wells sampled were less than 1,000 µg/L.
- In Q4 2024, Cr concentrations greater than the NJDEP GWQS (70 µg/L) were observed at one shallow zone monitoring well (GPS-MW5S, 119 µg/L). Cr(VI) was detected in this well (at 5.2 µg/L).
- The footprint of the Cr plume is stable and not expanding (Figure 3A).

*Intermediate Water-Bearing Zone*

- In the intermediate water-bearing zone, 28 monitoring wells were sampled for Cr and Cr(VI) in Q4 2024 (Figure 3B, Table 4).
- In Q4 2024, Cr(VI) concentrations at 20 out of 28 (71%) intermediate monitoring wells were less than 1,000 µg/L, demonstrating significant treatment success.
- In Q4 2024, eight monitoring wells out of 28 wells (29%) contained Cr(VI) concentrations greater than 1,000 µg/L. Concentrations of Cr(VI) in these wells for the most recent sampling results ranged from 3,800 µg/L to 1,620,000 µg/L. Of these wells:
    - One well (114-P2-MW-12D) is in an area where the presence of DNAPL has slowed reactive zone propagation. Well 114-P2-MW-12D contains DNAPL and observed data trends were defined by a prolonged treatment period prior to increased TOC and declines in concentrations of Cr(VI) (see Appendix B-2). Decreases in Cr(VI) concentrations are ongoing at 114-P2-MW-12D. The Cr(VI) concentration at 114-P2-MW-12D has decreased steadily and has reduced by 88% since baseline sampling (743,000 µg/L to 92,100 µg/L), consistent with the increase in TOC concentrations noted since the start of injections in this area. In addition, negative ORP values and low DO concentrations (less than [<] 2 milligrams per liter [mg/L]) have been recorded in seven of the last eight sampling events. These observations indicate that the presence of DNAPL does not preclude development of the reactive zone and Cr(VI) treatment. Sustained TOC from the Phase II injection program at 114-P2-MW-12D supports ongoing Cr(VI) reduction and the presence of DNAPL also supports reactive zone treatment as part of the groundwater remedy.
    - Five wells (114-MC-PZ103, 114-P1-MW-7I, 114-P2-MW-5I, 114-P2-MW-6I, and 114-P2-MW-8I) are in areas where active operations have been completed. These wells are located in the Phase II Recalcitrant Area. As presented in the draft GA Group Groundwater RAR (AECOM, 2023), it is acknowledged that limited reactive zone response has been observed in these areas. Residual Cr(VI) concentrations in these areas are attributable to subsurface heterogeneities within the native formation, including the presence of low-permeability soils that do not readily accept remediation compounds and the presence of hydraulically isolated lenses of soils that do not readily participate in the overall advective groundwater flow regime. These conditions and the associated residual Cr(VI) concentrations were expected, and the remedy was designed to

accommodate them. While these areas are expected to exhibit detectable Cr(VI) or yellow-colored water in the near-term, the reactive zones established around these areas will serve to stabilize Cr(VI) and Cr, prevent long-term transport, and support ongoing *in situ* anaerobic bioprecipitation (ISAB) processes. An HPT/VAP Investigation Work Plan to further evaluate existing subsurface conditions in this area was submitted to the NJDEP on December 31, 2024 (AECOM, 2024d).

- Two wells (114-PZ-57I and 114-PZ-66I) are in the area where yellow-colored water was observed during installation of the basal till and bedrock remediation and monitoring wells. These wells were first sampled in Q2 2024, and sampling of these wells will continue as part of the basal till and bedrock remedy monitoring programs. An HPT/VAP Investigation Work Plan to further evaluate existing subsurface conditions in this area was submitted to the NJDEP on December 31, 2024 (AECOM, 2024d).

- In Q4 2024, concentrations of Cr for the most recent sampling results in the intermediate water-bearing zone ranged from non-detect (< 10 µg/L) to 1,950,000 µg/L. The Cr concentration at well 114-P2-MW-3I decreased to less than the NJDEP GWQS (70 µg/L) during Q4 2024. The footprint of the Cr plume on Site 114 is stable and not expanding (Figure 3B).

*Deep Water-Bearing Zone*

- In the deep water-bearing zone, 13 monitoring wells were sampled for Cr and Cr(VI) in Q4 2024 (Figure 3C, Table 4).
- In Q4 2024, 11 out of 13 wells (85%) contained Cr(VI) concentrations less than 1,000 µg/L, demonstrating significant treatment success.
- In Q4 2024, two out of 13 monitoring wells (15%) contained Cr(VI) concentrations greater than 1,000 µg/L. Concentrations of Cr(VI) in these wells for the most recent sampling results ranged from 165,000 µg/L to 198,000 µg/L. Of these wells:
    - Two wells (114-P1-MW-6D and 114-P1-MW-7D) are in areas where active operations have been completed. These wells are located in the Phase II Recalcitrant Area. As presented in the draft GA Group Groundwater RAR (AECOM, 2023), it is acknowledged that limited reactive zone response has been observed in these select areas. Residual Cr(VI) concentrations in these areas are attributable to subsurface heterogeneities within the native formation, including the presence of low-permeability soils that do not readily accept remediation compounds and the presence of hydraulically isolated lenses of soils that do not readily participate in the overall advective groundwater flow regime. These conditions and the associated residual Cr(VI) concentrations were expected, and the remedy was designed to accommodate them. While these areas are expected to exhibit detectable Cr(VI) or yellow-colored water in the near-term, the reactive zones established around these areas will serve to stabilize Cr(VI) and Cr, prevent long-term transport, and support ongoing *in situ* ISAB processes. An HPT/VAP Investigation Work Plan to further evaluate existing subsurface conditions in this area was submitted to the NJDEP on December 31, 2024 (AECOM, 2024d).
- In Q4 2024, concentrations of Cr for the most recent sampling results in the deep water-bearing zone ranged from non-detect (< 10 µg/L) to 157,000 µg/L. The footprint of the Cr plume is stable and not expanding (Figure 3C).

*Lower Deep Zone (Phase III, Target Area 1B)*

- In the lower deep zone, ten monitoring wells were sampled for Cr and Cr(VI) in Q4 2024 (Figure 3D, Table 4).
- In Q4 2024, five out of ten wells (50%) contained Cr(VI) concentrations less than 1,000 µg/L.
- In Q4 2024, five out of ten wells (50%) contained Cr(VI) concentrations greater than 1,000 µg/L. Concentrations of Cr(VI) in these wells for the most recent sampling results ranged from 36,000 to 478,000 µg/L (114-MW68C, 114-P3-MW003D, 114-P3-MW004D, 114-P3-MW005D and 114-P3-

MW006D). The Cr(VI) concentration at well 114-PZ-66D decreased below 1,000 µg/L during Q4 2024. The established FerroBlack®-H reactive zones will continue to address Cr(VI) concentrations, with treatment expected to be a long-term process due to the slow groundwater flow velocities in this zone. A conceptual remedial design for this area was discussed with NJDEP during the June and July SME Meetings (AECOM, 2024c).

- In Q4 2024, concentrations of Cr for the most recent sampling results in the Lower Deep Zone ranged from non-detect (< 10 µg/L) to 478,000 µg/L.
- Lower Deep Zone well 114-PZ-66D has responded to and achieved treatment breakthrough from injections in the bedrock, indicating that there is an advective transport pathway in the southwestern quadrant of Site 114 from bedrock into the overburden.

### 3.1.2 Carteret Avenue and HCC Sites 132, 137A, and 143 (Phase III, Target Area 1A)

*Intermediate Water-Bearing Zone*

- In the intermediate water-bearing zone, 26 monitoring wells were sampled for Cr and Cr(VI) in Q4 2024 (Figure 3B, Table 4).
- In Q4 2024, 25 out of 26 wells (96%) contained Cr(VI) concentrations less than 1,000 µg/L, demonstrating significant treatment success.
- In Q4 2024, one monitoring well out of 26 (4%) contained Cr(VI) concentrations greater than 1,000 µg/L (144-MW22BR), where the most recent Cr(VI) was detected at a concentration of 1,900 µg/L. Prior to Q2 2024, and since April 2023, Cr(VI) concentrations at this well were less than 1,000 µg/L. TOC breakthrough has previously been achieved at this well indicating a reactive zone presence. Quarterly monitoring is expected to continue through Q1 2025 to evaluate remedy effectiveness while the aquifer equilibrates in this area.
- In Q4 2024, concentrations of Cr ranged from non-detect (< 10 µg/L) to 3,670 µg/L. Cr concentrations at 132-P3-MW001I-A and 143-P3-MW002I-B decreased to less than the NJDEP GWQS (70 µg/L) during Q4 2024. The footprint of the Cr plume is stable and not expanding (Figure 3B).

*Deep Water-Bearing Zone*

- In the deep water-bearing zone, seven monitoring wells were sampled for Cr and Cr(VI) in Q4 2024 (Figure 3C, Table 4).
- In Q4 2024, Cr(VI) concentrations at the seven deep monitoring wells (100%) were less than 1,000 µg/L.
- In Q4 2024, concentrations of Cr for the most recent sampling results in the deep water-bearing zone ranged from non-detect (< 10 µg/L) to 646 µg/L. Cr concentrations greater than the NJDEP GWQS were observed at two deep zone monitoring wells (CAR-P3-MW001D and CAR-P3-MW002D). Cr concentration at one monitoring well (137-MW1C) decreased to less than the NJDEP GWQS (70 µg/L) during Q4 2024. The footprint of the Cr plume is stable and not expanding (Figure 3C).

### 3.1.3 Halladay Street, former Halsted property, and Eden Wood Property (Phase III, Target Area 2)

*Intermediate Water-Bearing Zone*

- In the intermediate water-bearing zone, 22 monitoring wells were sampled for Cr and Cr(VI) in Q4 2024 (Figure 3B, Table 4).
- In Q4 2024, five out of the 22 wells were sampled in the Eden Wood Property. Cr(VI) concentrations at the five Eden Wood monitoring wells were less than 1,000 µg/L. Concentrations of Cr for the most recent sampling results in the Eden Wood monitoring wells ranged from non-detect (< 10 µg/L) to 118 µg/L.

- In Q4 2024, 17 out of 22 wells (77%) contained Cr(VI) concentrations less than 1,000 µg/L, demonstrating significant treatment success.
- In Q4 2024, five monitoring wells (HAL-P3-MW001I-B, HSTD-P3-MW001I-A, HSTD-P3-MW001I-B, HSTD-P3-MW002I-B, and HSTD-P3-MW003I-B) out of 22 wells (23%) contained Cr(VI) concentrations greater than 1,000 µg/L. Concentrations of Cr(VI) in these wells for the most recent sampling results ranged from 6,500 µg/L to 544,000 µg/L. Operation of the *in situ* remedy will continue in these areas.
- In Q4 2024, concentrations of Cr for the most recent sampling results in the intermediate water-bearing zone ranged from non-detect (< 10 µg/L) to 538,000 µg/L. The Cr concentration at one monitoring well (MW8D) decreased to less than the NJDEP GWQS (70 µg/L) during Q4 2024. The footprint of the Cr plume is stable and not expanding (Figure 3B).

*Deep Water-Bearing Zone*

- In the deep water-bearing zone, one remediation well was sampled for Cr and Cr(VI) in Q4 2024 (Figure 3C, Table 4).
- Cr(VI) and Cr concentrations at this well were not detected.

### 3.1.4 Forrest Street Properties and Site 199 (Phase III, Target Area 3)

*Shallow Water-Bearing Zone*

- In the shallow water-bearing zone, 12 monitoring wells were sampled for Cr and Cr(VI) in Q4 2024 (Figure 3A, Table 4).
- In Q4 2024, Cr(VI) concentrations at the 12 wells (100%) were less than 1,000 µg/L.
- In Q4 2024, Cr concentrations at nine out of 12 shallow water-bearing zone monitoring wells were less than the NJDEP GWQS (70 µg/L). Concentrations for the most recent sampling results ranged from non-detect (< 10 µg/L) to 392 µg/L. The Cr concentration at one monitoring well (MW1C-4) decreased to less than the NJDEP GWQS (70 µg/L) during Q4 2024. The footprint of the Cr plume is stable and not expanding (Figure 3A).

*Intermediate Water-Bearing Zone*

- In the intermediate water-bearing zone, 14 monitoring wells were sampled for Cr and Cr(VI) in Q4 2024 (Figure 3B, Table 4).
- In Q4 2024, Cr(VI) concentrations at the 14 wells (100%) were less than 1,000 µg/L, demonstrating significant treatment success.
- In Q4 2024, concentrations of Cr for the most recent sampling results in the intermediate water-bearing zone ranged from non-detect (< 10 µg/L) to 5,850 µg/L. The footprint of the Cr plume is stable and not expanding (Figure 3B).

*Deep Water-Bearing Zone*

- In the deep water-bearing zone, two monitoring wells on Site 199 were sampled for Cr and Cr(VI) in Q4 2024 (Figure 3C, Table 4).
- In Q4 2024, Cr(VI) concentrations at both wells (100%) were less than 1,000 µg/L.
- The concentration of Cr at one well (199-P3-MW003D) was greater than the NJDEP GWQS (70 µg/L) in the most recent sampling results from Q4 2024, with a Cr concentration of 140 µg/L. Cr concentrations at 199-P3-MW004D decreased to less than the NJDEP GWQS during Q4 2024.

### 3.1.5 Basal Till

- In the basal till, 18 wells were sampled for Cr and Cr(VI) in Q4 2024 (Figure 3E, Table 4).

- In Q4 2024, 17 out of 18 monitoring wells (94%) contained Cr(VI) concentrations less than 1,000 µg/L. The Cr(VI) concentration at well 114-PMW-02T decreased to less than 1,000 µg/L in Q4 2024.
- In Q4 2024, one out of 18 monitoring wells (6%) contained Cr(VI) concentrations greater than 1,000 µg/L. The concentration of Cr(VI) for the most recent sampling result at this well (114-MW56C) was 4,000 µg/L. This well is in the southwestern Site 114 Basal Till Pilot Test treatment area where active *in situ* injections were completed from June 13 to June 26, 2024, recommenced on October 23, 2024, and continued through December 6, 2024. Performance groundwater monitoring in accordance with the approved Basal Till DGW PBR will continue to evaluate the treatment response in these areas.
- In Q4 2024, concentrations of Cr for the most recent sampling results in the basal till ranged from non-detect (< 10 µg/L) to 4,160 µg/L.

#### 3.1.6 Bedrock Water-Bearing Zone

- In the bedrock water-bearing zone, 19 wells were sampled for Cr and Cr(VI) in Q4 2024 (Figure 3F, Table 4).
- In Q4 2024, 17 out of 19 bedrock wells (89%) contained Cr(VI) concentrations less than 1,000 µg/L.
- In Q4 2024, 2 out of 19 (11%) bedrock wells contained Cr(VI) concentrations greater than 1,000 µg/L (114-MW66D and 114-MW76WR). Concentrations of Cr(VI) for the most recent sampling results in bedrock ranged from non-detect (< 10 µg/L) to 45,800 µg/L and concentrations of Cr in bedrock ranged from non-detected (< 10 µg/L) to 34,000 µg/L.
- In Q4 2024, Cr(VI) concentration reductions were noted in three bedrock monitoring wells (114-MW66D, 114-MW76WR, and 114-PZ-66WR) and TOC breakthrough was observed in seven bedrock monitoring wells (114-MW52D, 114-PZ-52WR, 114-MW53C, 114-MW57C, 114-MW57D, 114-MW79WR, and 114-PZ-66WR), indicating an improvement in water quality in the bedrock in response to active groundwater treatment.
- Bedrock well 114-PZ-52WR has responded to and achieved treatment breakthrough from injections in the deep water-bearing zone at remediation well 114-P2-IRM-89D (AECOM, 2023). During Q4 2024, TOC breakthrough was also observed at 114-PZ-57T, 114-PZ-66T, 114-MW54C, and 114-MW61C (screened in basal till), which can be attributed to bedrock injections. Combined, these observations indicate that there is an advective transport pathway in the southwestern quadrant of Site 114 from overburden into bedrock and from bedrock into overburden.

### 3.2 Other Constituents of Concern

- Per the GA Group Groundwater RAWP (AECOM, 2022), a localized PCE plume in the shallow water-bearing zone on Site 199 was actively treated via *in situ* injections. Bioaugmentation with a *Dehalococcoides* consortium was performed in July 2023. Groundwater samples are collected quarterly from three shallow wells and one intermediate well on Site 199 for analysis of PCE and its breakdown products (Appendix A-2).
    - In Q4 2024, PCE, trichloroethene, cis-1,2-dichloroethene, and vinyl chloride were not detected in monitoring wells on Site 199. This is the fourth quarter of data indicating concentrations less than the GWQS for these CVOCs.

## 4. Deviations or Problems Encountered During Reporting Period

### 4.1 Deviations from or Modification to the PBRs

- There were no modifications to the DGW PBRs in Q4 2024.

### 4.2 Problems Encountered

- Injection operations across the target areas were offline the week of December 23rd due to subfreezing conditions.

## 5. Work Scheduled for Next Reporting Period (in Q1 2025)

- Within the Phase III area, reagent injections, operational monitoring, and treatment monitoring will continue in the Halladay/Halsted Target Area. In Phase III areas where reagent injections have been completed (i.e., within Site 199, Carteret Avenue Right-of-Way [ROW], Carteret Avenue, South of Carteret Avenue, and Forrest Street/Forrest Street Properties), post-treatment monitoring will continue on a quarterly basis.
- Within the basal till, groundwater monitoring will continue on a quarterly basis.
- Within the bedrock, groundwater monitoring will continue on a quarterly basis. Beginning with the next RAPR (i.e., the Q1 2025 RAPR), the visual representation of Cr(VI) concentrations in bedrock (Figure 4F) will combine the weathered and competent rock data into a single figure as the groundwater flow regime is continuous across all the bedrock.
- Groundwater will continue to be monitored for Cr(VI) in the vicinity of the Eden Wood property on a quarterly basis.
- Groundwater sampling to monitor the extent of Cr at concentrations greater than the GWQS will continue on a semi-annual basis across the Project Area.
- An updated Conceptual Site Model of the Project Area will be submitted.
- An Addendum to the Groundwater Remedial Investigation Report (RIR) and Groundwater RAWP for Bedrock will be submitted.
- A Draft Work Plan and PBR Application for remediation in the Phase I Redevelopment Area will be submitted.
- The HPT/VAP Investigation Work Plan will be finalized and submitted.

**Notes and Abbreviations:**

(1) Overall Progress volumes include total volume injected through 1/3/25, the Bedrock Injection Program completion date.

(2) 84,929 gallons were injected during the Phase II program.

**Notes:**

1. Most recent results can be found in Appendix A.
2. Underlined concentrations indicate non-detect values at the sample reporting limit.
3. For baseline data points that were rejected during validation, or for wells not sampled during the baseline events, the data from the next recent treatment monitoring event was used.
4. A negative sign (-) indicates a concentration decrease compared to baseline.
5. Concentration reductions are not calculated for instances where the baseline and most recent concentrations are less than the reporting limit or less than 70 ug/L (the Cr Groundwater Quality Standard) and are noted as " -- ".

| | |
|---|---|
| Gray Shading | Most recent Cr(VI) and Cr concentrations (as depicted on Figures 3A-3F), and where applicable, compared to the baseline concentration in calculation of the % change. |

**Abbreviations:**

**Groundwater Remedial Action Progress Report, Q4 2024 – Garfield Avenue Group Sites**
**PPG, Jersey City, New Jersey**

| Comment # | Document Location | Comment | Response |
|---|---|---|---|
| 1 | NA | For future progress reports, please add a table of contents, section numbers, and subsection numbers to help the review process and improve the overall organization of the progress reports. We recognize that bookmarks were already provided in the PDF file. | Section and subsection numbers have been added to the letter report for the Q4 2024 RAPR. Section numbers and names are also listed before the Lists of Tables, Figures and Appendices. |
| 2 | Appendix B-7 | Although it is understood that discussions related to an acceptable timeframe to achieve 1,000 ug/L are on hold at this time, please add a column to the table "Statistical Analysis of Groundwater Monitoring Data" with an estimated timeframe (for those wells with decreasing trends) to achieve groundwater concentrations of 1,000 ug/L hexavalent chromium based on the trend analysis. The Department still sees value in understanding these timeframes to evaluate progress towards the enhanced attenuation remedy and overall effectiveness. | Calculations of estimated timeframes for Cr(VI) to attenuate to 1,000 µg/L must be interpreted with caution as these numbers are based on an assumption that current trends and decay rate constants will remain consistent over several years. Decay rates may vary significantly as additional data are collected. However, as requested by NJDEP, estimated timeframes for Cr(VI) to attenuate to 1,000 µg/L have been added to Appendix B-7 for those wells with decreasing trends, as well as for certain wells with a "No Trend" determination, as visual interpretation indicates a decreasing pattern. Finally, it is noted that wells situated in the Lower Deep Zone are listed separately because the current remedy for that zone (reactive barrier) is different from the current remedy for other wells listed on the table (ISAB). |
| 3a | Appendix E | Please clarify whether injection has been resumed in well 114-PW-02T, and if so, please identify in the next progress report the injection resumption date, injection rate, injection pressures, and injection volume associated with the resumption of injection. | Injections at well 114-PW-02T (basal till) recommenced on October 23, 2024 (i.e., in Q4 2024) and continued through the end of the Basal Till DGW PBR-period, December 6, 2024. This is described in the current RAPR for Q4 2024. Please refer to Table 3b of the Q4 2024 RAPR. |
| 3b.1 | Appendix E | Regarding the third sentence of the second paragraph on the first page of text, please provide a reference (e.g., technical paper, textbook, guidance document, etc.) for the methodology used to determine qualitative groundwater velocity | The methodology applied was described by Suthersan et al. (2014), which was adapted from Valocchi (1989) and Goltz and Roberts (1987). Complete references are included below.<br>• Suthersan, S., Divine, C., Cohen, E., Heinze, K. 2014. Tracer testing: recommended best practice for design and optimization of in situ remediation systems Groundwater Monitoring and Remediation, 34(3), 33-40.<br>• Goltz, M.N., Roberts, P.V. 1987. Using the method of moments to analyze three-dimensional diffusion-limited solute transport from temporal and spatial perspectives. Water Resources Research, 23(8), 1575-1585.<br>• Valocchi, A.J. Use of temporal moment analysis to study reactive solute transport in aggregated porous media. Geoderma, 46, 233-247. |
| 3b.2 | Appendix E | In addition, please provide the backup calculations. | As stated in Appendix E: "…*the groundwater velocity can… be estimated by dividing d (the distance between the upgradient edge of displacement and the monitoring well location) by the duration over which a 50% decline in TOC and/or D2O was observed during the post-injection monitoring period."*<br><br>An example calculation is provided below for **114-PMW-03T:**<br>See response to 3c below for upstream displacement radius of influence (ROI) or "*r*" calculation.<br>*114-PW-03T r* = 9.6 feet<br>*d* = *r* + distance from 114-PW-03T to 114-PMW-03T = 9.6 feet + 5 feet = 14.6 feet<br>Estimated time for 50% TOC/D2O reduction = 28 days (see Figure E-4)<br>v = 14.6 feet / 28 days = <u>0.52 feet / day</u> |

**Table 5**
**NJDEP Comments and PPG Responses on Q3 2024 Remedial Action Progress Report**

**PPG, Jersey City, New Jersey**

| Comment # | Document Location | Comment | Response |
|---|---|---|---|
| | | | |
| 3b.3 | Appendix E | Note that the groundwater velocities provided in the quarterly report are different from those presented for the same wells during the Garfield Avenue Group Sites Groundwater update meeting held on October 22, 2024. Specifically, the groundwater velocities presented in the meeting for wells PMW-03T and PMW-04T were 0.18 feet per day (ft/day) and 0.07 ft/day respectively, whereas the velocities presented in Appendix E for these same wells were significantly higher at 0.52 ft/day and 0.23 ft/day respectively. | As stated in the October 22, 2024 meeting and described in the meeting summary, the deuterium (D2O) and total organic carbon (TOC) analytical data presented during the meeting were preliminary and did not include all sampling events (i.e., they were the data available at that time). Since then, additional D2O and TOC analytical data were received, and thus Appendix E for the Q3 2024 RAPR was prepared using **all** available data to inform the calculations. Note that Appendix E included the following statement: "*Estimated groundwater velocities for the three wells are included in the figure based on the available post-injection TOC and D2O dataset. These velocity estimates may change as more data become available."* |
| 3c | Appendix E | Please clarify how "Upstream displacement radius of influence" was determined at each location. | The upstream displacement ROI (*r*) was determined based on the total volume injected at the nearby injection well and the estimated mobile fraction obtained via the breakthrough analysis performed (Figures E-1 through E-3). Then, Equation 1 provided in Appendix E was utilized ($Vol = \pi r^2 h\theta_m$), wherein the user solves for "*r*" to determine the upstream displacement ROI.<br><br>An example calculation is provided below for **114-PMW-03T:**<br>114-PW-03T Vol = 1,508 gallons = 201.6 cubic feet<br>$\theta_m$= 7% (Figure E-2)<br>114-PW-03T h = 10 feet<br>r = $(\frac{Vol}{\pi * h * \theta_m})^{1/2}$ = $(\frac{201.6}{\pi * 10 * 0.07})^{1/2}$= **9.6 feet** |

**Appendix A-1**
**Groundwater Analytical Results - Hexavalent Chromium, Total Chromium, and Geochemistry**
**Groundwater Remedial Action Report, Q4 2024**
**Garfield Avenue Group Sites**
**PPG, Jersey City, New Jersey**

**Notes:**

1. There is no established NJ GWQS for hexavalent chromium. Results are compared to the 70 ug/L GWQS for total chromium.

2. Samples collected as part of treatment monitoring events, or other miscellaneous purposes and not used in remedial decision making, are not subject to data validation.

| | |
|---|---|
| < 10.0 U | Constituent not detected at concentration greater than the sample reporting limit. |
| 13.6 | Constituent detected at concentration greater than the sample reporting limit. |
| **311** | Constituent detected at concentration greater than the applicable NJ GWQS. |

**Abbreviations:**

| | |
|---|---|
| bTOIC | below top of inner casing |
| CAS-RN | Chemical Abstracts Service Registry Number |
| D | dissolved |
| deg C | degree Celsius |
| FD | field duplicate |
| ft | feet |
| GWQS | Groundwater Quality Standard(s) |
| mg/L | milligrams per liter |
| mS/cm | micro Siemens per centimeter |
| mv | millivolts |
| N | normal sample type |
| NA | not applicable |
| NEV | not enough volume |
| NM | not measured |
| NTU | nephelometric turbidity units |
| OR | over range |
| ORP | oxidation-reduction potential |
| SDG | sample delivery group |
| su | standard pH units |
| T | total |
| TOC | total organic carbon |
| ug/L | micrograms per liter |
| -- | analyte not tested |
| ** | suspect field measurement due to instrument error |
| *** | Turbidity meter on Aquatroll 600 was malfunctioning. Turbidity was checked with a calibrated Lamotte. |

**Data Qualifiers:**

| | |
|---|---|
| B | Indicates the analyte was detected in the blank but not greater than the sample reporting limit. |
| F1 | Indicates the matrix spike and/or matrix spike duplicate recovery exceeds control limits. |
| F2 | Indicates the matrix spike and/or matrix spike duplicate relative percent difference exceeds control limits. |
| H | Indicates the analysis was performed outside of the sample holding time. |
| J | The compound was positively identified; however, the associated numerical value is an estimated concentration only. |
| J- | Indicates the analyte was positively identified; the associated numerical value is an estimated quantity with a potential low bias. |
| J+ | Indicates the analyte was positively identified; the associated numerical value is an estimated quantity with a potential high bias. |
| JB | Indicates the analyte concentration is greater than three times, but less than or equal to ten times the concentration in the associated method/prep blank. The presence of that analyte in the sample is considered "real". The concentration is quantitatively qualified (JB) due to method blank contamination. |
| R | The sample result was rejected due to serious deficiencies; the presence or absence of the analyte could not be confirmed. |
| RA | The sample results are rejected but still considered useable. |
| U | Indicates the analyte was analyzed for but not detected. |
| UB | Indicates the analyte was detected in the sample and blank, but not above the sample reporting limit. |
| UF1 | Indicates the matrix spike and/or matrix spike duplicate recovery exceeds control limits, but analyte not detected |
| UJ | Indicates the analyte was not detected greater than the reporting limit and the reporting limit was approximate. |

**Appendix A-2**
**Groundwater Analytical Results - Volatile Organic Compounds**
**Groundwater Remedial Action Report, Q4 2024**
**Garfield Avenue Group Sites**
**PPG, Jersey City, New Jersey**

**Notes:**

1. Samples collected as part of treatment monitoring events are not subject to data validation.

| | |
|---|---|
| < 1.0 U | Constituent not detected at concentration greater than the sample reporting limit. |
| 13.6 | Constituent detected at concentration greater than the sample reporting limit. |
| **311** | Constituent detected at concentration greater than the applicable NJ GWQS. |

**Abbreviations:**

| | |
|---|---|
| bTOIC | below top of inner casing |
| CAS-RN | Chemical Abstracts Service Registry Number |
| FD | field duplicate |
| ft | feet |
| GWQS | Groundwater Quality Standard(s) |
| N | normal sample type |
| N/A | not applicable |
| NJ | New Jersey |
| SDG | sample delivery group |
| T | total |
| ug/L | micrograms per liter |
| -- | analyte not tested |

**Data Qualifiers:**

| | |
|---|---|
| D | Sample was diluted. |
| J | The compound was positively identified; however, the associated numerical value is an estimated concentration only. |
| J+ | Indicates the analyte was positively identified; the associated numerical value is an estimated quantity with a potential high bias. |
| U | Indicates the analyte was analyzed for but not detected. |
| UB | Indicates the analyte was detected in the sample and blank, but not above the sample reporting limit. |
| UF1 | Indicates the matrix spike and/or matrix spike duplicate recovery exceeds control limits, but analyte not detected. |
| UJ | Indicates the analyte was not detected greater than the reporting limit and the reporting limit was approximate. |

**Notes:**

1. Samples collected as part of treatment monitoring events, or other miscellaneous purposes and not used in remedial decision making, are not subject to data validation.

| | |
|---|---|
| < 10.0 U | Constituent not detected at concentration greater than the sample reporting limit. |
| 3.4 | Constituent detected at concentration greater than the sample reporting limit. |

**Abbreviations:**

| | |
|---|---|
| CAS-RN | Chemical Abstracts Service Registry Number |
| D | dissolved |
| EB | equipment blank |
| FB | field blank |
| mg/L | milligrams per liter |
| QA | quality assurance |
| QC | quality control |
| SDG | sample delivery group |
| T | total |
| TB | trip blank |
| ug/L | micrograms per liter |
| -- | analyte not tested |

**Data Qualifiers:**

| | |
|---|---|
| B | Indicates the analyte was detected in the blank but not greater than the sample reporting limit. |
| J | The compound was positively identified; however, the associated numerical value is an estimated concentration only. |
| JB | Indicates the analyte concentration is greater than three times, but less than or equal to ten times the concentration in the associated method/prep blank. The presence of that analyte in the sample is considered "real". The concentration is quantitatively qualified (JB) due to method blank contamination. |
| U | Indicates the analyte was analyzed for but not detected. |
| UB | Indicates the analyte was detected in the sample and blank, but not above the sample reporting limit. |
| R | The sample result was rejected due to serious deficiencies; the presence or absence of the analyte could not be confirmed. |

# Groundwater Remedial Action Report, Q4 2024
# Garfield Avenue Group Sites
# PPG, Jersey City, New Jersey

**Notes:**

1. Samples collected as part of treatment monitoring evemts, or other miscellaneous purposes and not used in remedial decision making, are not subject to data validation.

| | |
|---|---|
| < 2.0 U | Constituent not detected at concentration greater than the sample reporting limit. |
| 0.0972 | Constituent detected at concentration greater than the sample reporting limit. |

**Abbreviations:**

| | |
|---|---|
| CAS-RN | Chemical Abstracts Service Registry Number |
| FB | field blank sample |
| QA | quality assurance |
| QC | quality control |
| SDG | sample delivery group |
| TB | trip blank sample |
| ug/L | micrograms per liter |
| -- | analyte not tested |

**Data Qualifiers:**

| | |
|---|---|
| U | Indicates the analyte was analyzed for but not detected. |
| UJ | Indicates the analyte was not detected greater than the reporting limit and the reporting limit was approximate. |
| R | The sample result was rejected due to serious deficiencies; the presence or absence of the analyte could not be confirmed. |

## Introduction to Appendix B, Performance Trend Charts

Quantitative and qualitative data collected during ongoing groundwater monitoring programs serve as multiple lines of evidence to evaluate the progression of treatment operations: reductions in hexavalent chromium (Cr[VI]) and total chromium (Cr) concentrations, total organic carbon (TOC) distribution, and development of geochemical conditions conducive for sustaining future Cr(VI) *in situ* anaerobic bioprecipitation (ISAB) and *in situ* chemical reduction (ISCR).

Through ongoing assessment of groundwater remedy operations, select indicators have emerged as the primary parameters for performance review and decision-making purposes based on ongoing trend analyses and treatment observations, including Cr, Cr(VI), TOC, sulfate, oxidation-reduction potential (ORP), and dissolved oxygen (DO).

The indicator parameters are displayed in the "at-a-glance" trend charts provided in this appendix. These graphics allow direct comparison of multiple lines of evidence at individual monitoring wells through the various operational and post-treatment phases. The parameters are also listed below in conjunction with their relevance to ongoing data review and the target ranges relevant to continued ISAB and ISCR remedy performance.

| Parameter | Evaluation Considerations | Target Range |
|---|---|---|
| Cr and Cr(VI) | Direct demonstration of ISAB and ISCR treatment. Injection and extraction programs target areas where Cr(VI) > 1,000 micrograms per liter (µg/L) and the monitoring program evaluates where Cr is less than the New Jersey (NJ) Groundwater Quality Standard (GWQS) of 70 µg/L. | Cr(VI): < 1,000 µg/L (active remedy)<br>Cr: < 70 µg/L |
| TOC | Direct indicator of reagent distribution within treatment areas. Increased TOC concentrations relative to baseline provide demonstration that molasses, emulsified vegetable oil (EVO), or residual organic matter exists in the vicinity of the monitoring well to sustain reducing conditions and biological and geochemical processes conducive to ISAB and ISCR. | > Baseline |
| Sulfate | Electron acceptor reduced in the presence of organic carbon electron donor. Sulfate reduction yields sulfide, which reacts in the presence of ferrous iron to form reactive iron sulfide, a key mechanism of treatment. Declines in sulfate relative to baseline values indicate sulfide formation is ongoing, and residual sulfate demonstrates sustained capacity for future sulfide formation. | Declines in sulfate concentrations by approximately 25 mg/L or more as evidence of sulfide formation for iron sulfide precipitation |
| ORP | Field measurement of the oxidation-reduction potential of the groundwater system. Trends compared to baseline, with declines (i.e., lower positive and/or increasingly negative ORP values) indicative of influence from the reactive zone and propagation of reducing conditions conducive to ISAB and ISCR mechanisms. | Presence of low positive and increasingly negative values as qualitative demonstration of reducing conditions |
| DO | Field measurement of dissolved oxygen as a competing electron acceptor. Targeted values of less than 2 milligrams per litre (mg/L) are indicative of sustained anaerobic conditions. | < 2 mg/L |

Performance trend charts are separated and organized by Phase as follows: Phase I, Phase II, Phase III, Basal Till and Bedrock Remedy, Bedrock, and Other Wells. Individual wells can be located using the bookmark function.

**Notes:**

1. Only those monitoring wells where Cr(VI) concentrations were greater than 1,000 ug/L in one or more of the four most recent sampling events, are included in this statistical analysis. The full list of wells where Cr(VI) has remained < 1,000 ug/L over four or more sampling events, is included in the following page.

2. Only wells that are in areas where injections have been completed, and where quarterly post-treatment monitoring has been initiated, have been included in this analysis. The dataset for each well is comprised of the last treatment monitoring data point (considered as the "baseline") and available post-treatment monitoring data.

3. Non-detects are assigned a value equal to half of the minimum detected concentration in each well.

4. Only those wells that have a minimum of four detected observations over at least two years are carried forward in this analysis. These are denoted by a "Yes" or "No" under the Data Use Objectives field. Wells that have not met this criteria have been grayed out.

5. The determination of trend is made based on the following conditions:

- If Mann-Kendall p-value < 0.05 & Mann-Kendall tau < 0 --> Decreasing
- If Mann-Kendall p-value < 0.05 & Mann-Kendall tau > 0 --> Increasing
- If Mann-Kendall p-value > 0.05 --> No Trend

6. The Mann-Kendall analysis was performed using the EnvStats package in R. Source: Millard SP (2013). EnvStats: An R Package for Environmental Statistics. Springer, New York. ISBN 978-1-4614-8455-4, https://www.springer.com.

7. First-order decay rates were obtained by determining the slope of the line plotting the natural logarithm of Cr(VI) concentrations versus time.

8. Calculations of estimated timeframes for Cr(VI) to attenuate to 1,000 µg/L must be interpreted with caution as these numbers are based on an assumption that current trends and decay rate constants will remain consistent over several years. Decay rates may vary significantly as additional data are collected.

9. For certain wells with a "No Trend" determination, visual interpretation indicates a decreasing pattern. Therefore, timeframes for Cr(VI) to attenuate to 1,000 µg/L have been calculated for these wells.

10. These wells are located within the Lower Deep Zone and did not receive reagent via direct injections, but rather, were wtihin the FerroBlack-H Reactive Zones emplaced on Site 114. These wells are located in an area identified for active injections.

**Abbreviations:**

Cr(VI) = hexavalent chromium

OLS = ordinary least square

ug/L = micrograms per liter

# WELL PERMIT

New Well

The New Jersey Department of Environmental Protection grants this permit in accordance with your application, attachments accompanying same application, and applicable laws and regulations. This permit is also subject to further conditions and stipulations enumerated in the supporting documents which are agreed to by the permittee upon acceptance of the permit

**Certifying Driller:** JOSEPH KURZYNOWSKI, MASTER LICENSE # 0001618

**Permit Issued to:** AQUIFER DRILLING & TESTING

**Company Address:** 75 EAST SECOND ST MINEOLA, NY 11501

## PROPERTY OWNER

Name: JERSEY CITY REDEVELOPMENT AGENCY

Organization: Redevelopment Agency

Address: 4 Jackson Square (39 KEARNEY AVE) 39 KEARNEY AVE

City: Jersey City State: New Jersey Zip Code: 07305

## PROPOSED WELL LOCATION

Facility Name: Hudson County Chormate Site 132

Address: 824 GARFIELD AVE

County: Hudson Municipality: Jersey City Lot: 2 Block: 21510

Easting (X): 610795 Northing (Y): 683048
Coordinate System: NJ State Plane (NAD83) - USFEET

**Local ID:** 114-MW81D

## SITE CHARACTERISTICS

## PROPOSED CONSTRUCTION

**WELL USE:** MONITORING

Other Use(s):

Diameter (in.): 6

Regulatory Program Requiring Wells/Borings:

Depth (ft.): 125

Case ID Number:

Pump Capacity (gpm): 1

Deviation Requested: N

Drilling Method: Sonic

Attachments:

## SPECIFIC CONDITIONS/REQUIREMENTS

**Approval Date:** October 30, 2024
**Expiration Date:** October 30, 2025

Approved by the authority of:
Shawn M. LaTourette
Commissioner

Kathleen Burkhard, Bureau Chief
Bureau of Water Allocation and Well Permitting

New Jersey State Department of Environmental Protection
Bureau of Water Allocation and Wells
PO BOX 420 Trenton, NJ 08625-0420 Tel: 609-984-6831

Well Permit Number
**E202411518**

# WELL PERMIT

New Well

| DEVIATION INFORMATION | |
|---|---|
| Purpose: | |
| Unusual Conditions: | |
| Reason for Deviation: | |
| Proposed Well Construction | |

| GENERAL CONDITIONS/REQUIREMENTS |
|---|
| A copy of this permit shall be kept at the worksite / on the property and shall be exhibited upon request. [N.J.A.C. 7:9D-1] |
| A well record must be submitted by the well driller to the Bureau of Water Systems and Well Permitting. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the well record shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Record: within ninety (90) days after the well is completed.[N.J.A.C. 7:9D-1] |
| All well drilling/pump installation activities shall comply with N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| For this permit to remain valid, the well approved in this permit shall be constructed within one year of the effective date of the permit. [N.J.A.C. 7:9D-1] |
| If the pump capacity applied for is less than 70 gpm, no subsequent increase to 70 gpm or more shall be made without prior approval of the Bureau of Water Systems and Well Permitting. [N.J.A.C. 7:9D-1] |
| If the use of the well is to be changed a well permit for the proposed use of the well shall be submitted for review and approval. [N.J.A.C. 7:9D-1] |
| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |
| The issuance of this permit shall not be deemed to affect in any way action by the New Jersey Department of Environmental Protection on any future application. [N.J.A.C. 7:9D-1] |
| This permit conveys no rights, either expressed, or implied to divert water. [N.J.A.C. 7:9D-1] |
| This permit does not waive the obtaining of Federal or other State or local Government consent when necessary. This permit is not valid and no work shall be undertaken until such time as all other required approvals and permits have been obtained. [N.J.A.C. 7:9D-1] |
| This permit is NONTRANSFERABLE [N.J.A.C. 7:9D] |
| This well shall not be used for the supply of potable / drinking water. [N.J.A.C. 7:9D-1] |

# MONITORING WELL CERTIFICATION FORM A - AS-BUILT CERTIFICATION

Date Stamp
(For Department use only)

## SECTION A. SITE NAME AND LOCATION

Site Name: HUDSON COUNTY SITE 132
List all AKAs: JERSEY CITY REDEVELOPMENT AGENCY
Street Address: 4 JACKSON ST (39 KEARNEY AVE)
Municipality: JERSEY CITY (Township, Borough or City)
County: HUDSON Zip Code: 07305
Program Interest (PI) Number(s): Case Tracking Number(s):

## SECTION B. WELL OWNER AND LOCATION

1. Name of Well Owner JERSEY CITY REDEVELOPMENT AGENCY
2. Well Location (Street Address) 824 GARFIELD AVE
3. Well Location (Municipal Block and Lot) Block# 21510 Lot # 2

## SECTION C. WELL LOCATION SPECIFICS

| | |
|---|---|
| 1. Well Permit Number (This number must be permanently affixed to the well casing): | E20241151B |
| 2. Site Well Number as shown on application or plans): | 114-MW81D |
| Well Completion Date: | 11/21/2024 |
| 4. Distance from Top of Casing (cap off) to ground surface (nearest 0.01'): | 3.00 |
| 5. Total Depth of Well to the nearest ½ foot: | 125.00 |
| 6. Depth to Top of Screen (or top of open hole) from top of casing (nearest 0.01'): | 128.00 |
| 7. Screen Length (or length of open hole) in feet: | 25' |
| 8. Screen or Slot Size: | N/A |
| 9. Screen or Slot Material: | N/A |
| 10. Casing Material (PVC, steel, or other – specify): | STEEL |
| 11. Casing Diameter (inches): | 6" |
| 12. Static Water Level from top of casing at the time of installation (nearest 0.01'): | 9.65 |
| 13. Yield (gallons per minute): | 1.5 GPM |
| 14. Development Techinque (specify): | PUMP + SURGE |
| 15. Length of Time well is developed/pumped or bailed (hours and minutes): | 4 HOURS |

**New Jersey Department of Environmental Protection**
Site Remediation Program

**Monitoring Well Certification Form B - Location Certification**

Date Stamp
(For Department use only)

## SECTION A. SITE NAME AND LOCATION

Site Name: Garfield Avenue Group Chrome Sites (PPG)
List all AKAs: PPG Site 114
Street Address: Garfield Avenue and Carteret Avenue
Municipality: City of Jersey City (Township, Borough or City)
County: Hudson Zip Code: 07305
Program Interest (PI) Number(s): Case Tracking Number(s):

## SECTION B. WELL OWNER AND LOCATION

1. Name of Well Owner: PPG Industries
2. Well Location (Street Address): PPG Site 114, Garfield Avenue and Carteret Avenue, Jersey City, NJ 07305
3. Well Location (Municipal Block and Lot): Block # 21501 Lot # 2

## SECTION C. WELL LOCATION SPECIFICS

1. Well Permit Number (This number must be permanently affixed to the well casing): E202411518
2. Site Well Number (As shown on application or plans): 114-MW81D
3. Geographic Coordinate NAD 83 to nearest 1/100 of a second:
   Latitude: North 40°42'28.18" Longitude: West 74°04'18.94"
4. New Jersey State Plane Coordinates NAD 83 datum, US survey feet units, to nearest foot:
   North 683046.5 East 610795.9
5. Elevation of Top of Inner Casing (cap off) at reference mark (nearest 0.01'): 15.45
   Elevation of Top of Outer Casing: 15.82 Elevation of Ground: 12.2
   *Check one:* [X] NAVD 88 [ ] NGVD29 [ ] On Site Datum [ ] Other
6. Source of elevation datum (benchmark, number/description and elevation/datum). If an on-site datum is used, identify here, assume datum of 100', and give approximated actual elevation (referencing NAVD 88).
   The vertical datum is the North American Vertical Datum of 1988 (NAVD88) GEOID09 verified by differential GPS observations from the Leica Smartnet Network on May 10, 2012. On site benchmarks have been set.
7. Significant observations and notes:
   Lot and Block information is for reference only and does not necessarily indicate that property, boundary, or lot lines have been surveyed relative to this well.

## SECTION D. LAND SURVEYOR'S CERTIFICATION

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe the submitted information is true, accurate and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine and imprisonment.

SEAL

Professional Land Surveyor's Signature: Date: 12/17/2024
Surveyor's Name: John D. Beattie License Number: 24GS04331900
Firm Name: Borbas Surveying & Mapping, LLC Certificate of Authorization #: 24GA28056200
Mailing Address: 402 Main Street
City/Town: Boonton State: New Jersey Zip Code: 07005
Phone Number: 973-316-8743 Ext: Fax:

Service ID: 1855859

This document has not yet been reviewed and approved or denied by the NJ DEP. Deficiencies in submittal information or actual construction may result in denial.

# Appendix D
# Bedrock Injection Summary

## Introduction to Appendix D –Bedrock Injection Summary

The Site 114 Bedrock Injection Work Plan and associated Discharge to Groundwater Permit-by-Rule (DGW PBR) Application was submitted to the NJDEP on March 15, 2024 (AECOM, 2024b). Meetings were held with the NJDEP on April 12 and April 23, 2024 to discuss the submitted plan, which was subsequently approved by the NJDEP on May 16, 2024 (NJDEP, 2024b). Well installation, well development, groundwater sampling, and injection activities were conducted during Q2, Q3, and Q4 2024 in accordance with the approved Work Plan. The sequence of events and references to where the respective data are provided in this RAPR, or previously submitted RAPRs, are outlined below:

| Date | Task | Task Detail | Location Data Provided |
|---|---|---|---|
| May 2, 2024 – June 12, 2024 | Well Installation and Well Development | The injection and monitoring wells are 4 inches in diameter and completed with 10-foot wire-wrapped stainless-steel screens. | Table 1 - Monitoring and Remediation Well Network and Construction Details |
| | | Following installation, wells were developed by pumping and surging to ensure proper connection with the surrounding aquifer. | Appendix D – Well Documentation provided in the Q3 2024 RAPR |
| May 20, 2024 – June 21, 2024 | Baseline Groundwater Monitoring | Sampling was conducted to quantify baseline analytical and geochemical conditions in groundwater so that indications of injectate propagation could be assessed during the testing. | Appendix A - Groundwater Sampling Analytical and QA/QC Sample Results |
| | | | Appendix E – Deuterium Analytical Data Summary |
| June 27, 2024 – July 3, 2024, September 25, 2024, and October 1, 2024 | Flushwater Pressure Testing of Injection Wells 114-PW-01WR, -02WR, -03WR, -04WR, -05WR, -06WR, -07WR, -09WR, -10WR, and 114-MW77WR | Pressure testing was conducted prior to injections to quantify the rate of pressure increase and dissipation at corresponding flow rates to maintain injection well integrity and avoid development of preferential fractures during injections. | Appendix D, Table D-1 – Pressure Testing Results |
| July 11, 2024 – January 3, 2025 | Bedrock Injections | A total of 412,237 gallons of fluids (molasses and water) were injected into the bedrock. | Table 3a – Operational Summary of Injection - Bedrock |
| July 11, 2024 - December 6, 2024 | Treatment Groundwater Monitoring | Sampling was conducted daily during the first stages of the injection period to evaluate arrival of injectate (Total Organic Carbon [TOC]) and changes in geochemical parameters (pH and specific conductivity). After the first two weeks of injections, sampling was reduced from a daily to a monthly frequency. Monthly sampling was | Appendix A - Groundwater Sampling Analytical and QA/QC Sample Results |

| Date | Task | Task Detail | Location Data Provided |
|---|---|---|---|
| | | conducted to evaluate Chromium (Cr), Hexavalent Chromium (Cr[VI]), and geochemical conditions during injections. For sampling events conducted from July through October 2024, monitoring wells were also sampled for the inert tracer Deuterium (D2O), which was injected during the basal till pilot test to differentiate the treatment responses attributed to the bedrock injection program versus the basal till pilot test. A table summarizing the monitoring wells at which breakthrough of TOC occurred in response to bedrock injections is provided in Table D-2. | Table E – Deuterium Analytical Data Summary<br><br>Appendix D, Table D-2 – TOC Breakthrough Summary |
| January 2025 – present | Post-Treatment Groundwater Monitoring | Quarterly sampling is ongoing to evaluate Cr, Cr(VI), and geochemical conditions following injections. | Appendix A - Groundwater Sampling Analytical and QA/QC Sample Results |

Based on data collected through Q4 2024, the objectives of the bedrock injection program have been met. Key findings include:

- Following bedrock injection start-up, reagent breakthrough has been achieved at seven bedrock monitoring wells, with maximum detected TOC concentrations ranging from 47 mg/L to 3,200 mg/L (Table D-2). As shown on Table D-2, the duration of injections at which reagent breakthrough was observed at those monitoring wells ranged from 1 to 160 days, indicating variability in the rate of injectate propagation within bedrock.
- Significant reductions in Cr(VI) concentrations in bedrock wells were observed in response to the bedrock injection program. As of Q4 2024, only two bedrock monitoring wells (114-MW76WR and 114-MW66D-Port 1) remain with Cr(VI) concentrations greater than 1,000 µg/L (Figure 4F, Progress panels).
- Injections into bedrock affected wells screened within the deep water-bearing zone (i.e., the basal till and Lower Deep Zone) as demonstrated by reagent breakthrough at wells 114-PZ-57T, 114-PZ-66D, 114-PZ-66T, 114-MW54C, and 114-MW61C (Table D-2), indicating that there is an advective transport pathway in the southwestern quadrant of Site 114 from bedrock into the overburden. Based on this observation, changes in the concentrations of Cr and Cr(VI) can be expected to occur at wells completed within the bedrock and deep overburden in response to the injection program implemented in the bedrock.

**$^{18}O$ & $^{2}H$ (CRDS)**
**Instrument Used:** Cavity Ring Down Spectroscopy (CRDS)
CRDS (Model L2130-i) (Picarro, California, USA).
**Standard Used:**
IT2-12E / IT2-13D / IT2-14C/ IT2-15B Calibrated with IAEA Standards (V-SMOW, SLAP, and GISP)
**Typical Standard deviation:**
($^{18}O$ ±0.1‰) ($^{2}H$ ± 1‰)

# List Of Issues

## NJDEP September 6, 2024 List of Issues for GAG Groundwater and PPG Responses – Status as of 3/5/25

| NJDEP Issue for GAG Groundwater | | PPG Response | | |
|---|---|---|---|---|
| **Item** | **Description** | **Response** | **Anticipated Completion Date** | **Status as of 3/5/25[1]** |
| **1** | **Demonstrate groundwater remedy effectiveness:** | | | |
| a | Confirm PPG's concurrence regarding the active groundwater remediation goal of 1,000 parts per billion (ppb) hexavalent chromium within a period of 8-10 years, to support transition from the active remedy to monitored natural attenuation (MNA). | It is PPG's position that items 1a to 1c are not required to demonstrate remedy effectiveness. Specifically, item 1a is not applicable as it was addressed to the NJDEP's satisfaction via responses to comments issued in October 2021 regarding GW-008 (the GAG Groundwater RAWP). Subsequent to PPG issuing the responses to comments, the Department approved the GAG Groundwater RAWP in January 2022 without further comments on this item. Furthermore, PPG does not concur with the Department's position that the NJDEP-approved remedial goal for GAG groundwater is to meet 1,000 ppb hexavalent chromium within a period of 8 to 10 years to support transition from the active remedy to MNA.<br><br>In review, remediation goals stated in the NJDEP-approved RAWP for GAG Groundwater include: "*Achieve compliance with the GWQS through the initial implementation of an active remedy where practicable in areas with groundwater $Cr^{+6}$ concentrations greater than 1,000 µg/L…."* and "*Transition to an MNA Category Groundwater RAP will be considered when monitoring data demonstrate that it is appropriate to do so*." The NJDEP-approved RAWP does not state that an active groundwater remediation goal of 1,000 ppb hexavalent chromium (CrVI) will be achieved within a period of 8-10 years nor that such a benchmark is the required criteria to support a transition from the active remedy to MNA. The 1,000 ppb Cr(VI) concentration is the basis for targeting areas for active treatment. The 8-10 years is the estimated timeframe for the duration of the enhanced attenuation period post injections. The NJDEP-approved RAWP does not indicate that 1,000 ppb Cr(VI) concentrations need to be achieved before a transition to MNA is appropriate and the NJDEP MNA guidance does not stipulate such a requirement. | Not Applicable (pending completion of additional investigation). | In progress.<br><br>Per 10/6/24 meeting with NJDEP, item is on hold until additional investigation requested by Item 5a and 5b is complete.<br><br>Anticipated schedule for additional investigation:<br>- Work Plan submittal to NJDEP in December 2024<br>- Field implementation from March-June 2025 |
| b | Demonstrate on a well-by-well basis, using statistical methods, that the active remediation goal of 1,000 ppb hexavalent chromium will be met within a period of 8-10 years. | | | |
| c | Evaluate the need for contingencies in locations where PPG cannot demonstrate achieving the active remediation goal in the timeframe as per item 1b above. | PPG's RAWP for GAG Groundwater contains a groundwater monitoring plan to monitor remedy effectiveness. Please refer to Section 7.4 and Table 7.2 of the RAWP that sets forth the steps PPG is taking to monitor remedy effectiveness. As a further effectiveness metric, PPG intends to utilize the conditions that must be met to obtain an Active Category Groundwater RAP. Specifically, the requirements specified in NJDEP Ground Water Remedial Action | | |

[1] Red = not resolved; Gold = in progress; no further discussion needed until additional data is collected; Green = resolved

Permit Guidance for the Active Category Groundwater RAP include the following, which have been met or will be met by PPG prior to submittal of an application for the Active Category Groundwater RAP:

| Condition | Status |
|---|---|
| 1. The active ground water treatment system is effectively operating and functioning as designed. A minimum of four (4) consecutive quarterly rounds of ground water samples should be collected to demonstrate this. | In progress.<br>The active groundwater treatment system is effectively operating and functioning as designed. Refer to Section 6.0 of the Draft GAG GW RAR (GW-111). Four quarters of post-treatment groundwater monitoring are complete for the Phase I and Phase II (majority) areas and will be complete in Q2 2025 for the Phase II Northern Area and Q1 2026 for the Phase III area. |
| 2. All soil contamination in the unsaturated zone has been remediated to the applicable numeric Migration to Ground Water Soil Remediation Standard for all AOCs associated with the CEA. | Condition met.<br><br>Refer to Section 3.0 of the Draft GAG GW RAR (GW-111). |
| 3. The ground water plume is not migrating horizontally or vertically into an uncontaminated aquifer zone adjacent to or below the contaminant plume. | Condition met.<br><br>Refer to Figures 3A-3F and 5A-I of the GAG GW Remedial Action Progress Report discussing progress through Q4 2024. These figures depict the limits of total chromium concentrations greater than the NJDEP GWQS in baseline and current progress conditions. |

|---|---|---|---|---|
| **Item** | **Description** | **Response** | **Anticipated Completion Date** | **Status as of 3/5/25[1]** |
| b | Continue basal till pilot testing program and evaluate potential for "scaling-up" the remediation system consistent with Department-approved permit-by-rule (PBR). | The basal till pilot test is ongoing via post-treatment monitoring. | A technical meeting was held with NJDEP on October 22, 2024 to discuss findings of the basal till pilot test and path forward. | No additional discussion needed at this time.<br><br>Basal Till pilot test completed in June 2024. Quarterly groundwater monitoring will continue through June 2026.<br><br>Based on groundwater monitoring data, and if warranted, continuation of injection operations in the basal till will be combined with the Lower Deep Zone and Phase I Recalcitrant Area. Refer to item 5b |
| **3** | **Evaluate the intermediate and deep groundwater-bearing zones which are unsuitable for direct injection:** | | | |
| a | PPG to present sitewide graphics clearly depicting low-permeability (C3) soils which will continue to act as contaminant storage zones. | Zones of low permeability have been depicted on cross-sections included in quarterly RAPRs since Q2 2022.<br><br>For clarification, the depiction of low permeability zones on the cross-sections is based on a simplification of the site geology where soils were categorized into three types:<br>• C1: high permeability, assigned a value of 1.<br>• C2: medium permeability, assigned a value of 2.<br>• C3: low permeability, assigned a value of 3.<br><br>Using this dataset, soils at the site were modeled in three dimensions to generate a continuous permeability array across the model domain. The cross-sections are generated by slicing through the model to render the soil types in two dimensions. Only low permeability zones are depicted on the cross-sections. | Resolution on depiction of low permeability zones on RAPR cross-sections: Q1 2025 | Unresolved.<br><br>Discussed during SME meetings on 10/10/24, 12/9/24, 1/2/25, and 2/18/25. Additional meetings necessary to resolve issue. Next meeting to be scheduled in March 2025. |

| | NJDEP Issue for GAG Groundwater | PPG Response | | |
|---|---|---|---|---|
| **Item** | **Description** | **Response** | **Anticipated Completion Date** | **Status as of 3/5/25[1]** |
| | | In order to generate the soil permeability array, it is necessary to define the appropriate bin ranges that represent low permeability, medium permeability, and high permeability and these must be defined as some range between 3, 2, and 1. Therefore, low permeability could be defined as everything greater than 2.5, moderate permeability could be everything between 1.51 and 2.5, and high permeability could be everything less than 1.51. This would seem like a logical approach but is not the most appropriate approach to displaying zones of low permeability because site geology is heterogenous and gradational. A more appropriate approach is to categorize all data above 2.1 as exhibiting low permeability. In this fashion, all values within the low permeability spectrum (i.e., all data which fall within the low permeability range from 2.1 to 3) are adequately considered. This is the approach that was employed for depiction of low permeability zones on the cross-sections included in the Q2 2024 RAPR. | | |
| b | Where areas are determined to not be amenable to contingencies per item 1c above, PPG to demonstrate technical impracticability (TI) with supporting empirical data. | PPG has not identified any areas that require a technical impracticability determination. Previously discussed recalcitrant areas are being managed under the NJDEP approved remedy which includes reactive zones established in permeable soils around low permeability zones, sheet pile, capillary breaks, institutional controls, and a site-wide CEA.<br><br>In addition, NJDEP MNA guidance indicates that MNA is appropriate for inorganics when it is demonstrated that immobilization/stabilization has occurred. The MNA guidance does not identify concentrations or timeframes which need to be achieved before a practitioner can conclude that MNA is an appropriate remedy for inorganics. Based on the above, a TI determination should not be required. | Not required. | No additional discussion needed at this time.<br><br>PPG has not identified any areas that require a technical impracticability determination. |
| **4** | **Supplement existing monitoring well network as necessary to document treatment effectiveness in the following areas (see Department January 10, 2024 comments on GAG Groundwater Remedial Action Report [RAR] regarding Haymes Letter Item 4 for specific examples):** | | | |
| a | Where expansive portions of the plume or vertical thicknesses exist that are not currently being monitored – There are significant informational gaps, both horizontally and vertically, within the treatment zones of interim remedial measure (IRM) Phases I, II, and III where large distances exist between well monitoring points; this limits the understanding of treatment effectiveness in these zones. PPG and the Department must discuss and come | Per discussions between NJDEP and PPG held in July 2024, NJDEP is to provide specifics to PPG identifying where the expansive portions of the plume and vertical thicknesses are located. Once received, this evaluation can continue. To facilitate the evaluation, NJDEP has requested an interactive tool from PPG that includes the most recent site data in a geospatially referenced platform. PPG provided this tool to the Department before the October 22, 2024 technical meeting. | Complete. | No additional discussion needed at this time.<br><br>In October 2024, PPG provided stakeholders an interactive tool that includes recent site data in a geospatially |

|---|---|---|---|---|
| **Item** | **Description** | **Response** | **Anticipated Completion Date** | **Status as of 3/5/25[1]** |
| | to consensus on the locations of these zones. | | | referenced platform (i.e., PlanEngage). |
| b | Where yellowish discolored water was observed in previously-treated areas – Following treatment within the footprint of IRM Phase I, discolored water was observed in the intermediate groundwater zone during basal till/pilot test well installation as well as during construction of the FerroBlack-H® Reactive Zones (FBRZ) in the lower deep water-bearing zone. PPG and the Department need to come to consensus on the areas where yellow water was detected and the path forward for this area. Also see Department 8/21/24 comments on 1st Quarter 2024 (1Q24) Groundwater Remedial Action Progress Report (GW RAPR). | Observations of yellow water in the intermediate water-bearing zone (WBZ) in the Phase I Area are consistent with observations of yellow water in the intermediate WBZ in the Phase II Recalcitrant Area (i.e., at 114-PMW-04T [35-40'] and 114-PW-04T [31-34']), which will be evaluated via Item 5a. Additional assessment will be conducted in the Phase I Area per Item 5c, which will provide insights and empirical data to support a decision on the path forward for this area. The data collected during implementation of Items 5a and 5c will be integrated into the site-wide CSM to describe the occurrence of yellow water within the intermediate WBZ. | Pending completion of Items 5a and 5c. | In progress.<br><br>HPT/VAP investigation in Phase I area to assess yellow water conditions is included in Work Plan for Items 5a and 5b.<br>- Work Plan submitted to NJDEP in December 2024<br>- Field implementation from March-June 2025 |
| c | Where full design volumes of treatment reagents were not injected – PPG must demonstrate that the remedy is effective in areas where the remedy injected less reductant than required by the remedial design. PPG to provide complete dosage information (i.e., % complete) to the Department to support determination of specific areas which may need additional monitoring well(s) based on this criterion. | This information is provided in Operational Summary Tables included in quarterly RAPRs and in the Phase I completion report.<br><br>PPG does not concur with the Department's assertion that there are areas where full design volume of treatment reagents were not injected. Target injection volumes and estimated treatment durations for the Phase I and II programs varied and were adaptive (i.e. more or less volume injected compared to design targets) based on observed remedial progress and performance data. At the time of Phase I and II programs completion, a total estimated volume of 9,400,000 gallons of fluid was injected for Phase I (target volume: 4,400,000 gallons, >200% complete), a total estimated volume of 3,835,729 gallons was injected in the Southeastern Area of the Phase II Program (target volume: 1,935,360 gallons, 198% complete), and a total estimated volume of 15,339,378 gallons was injected in the Northern Area of the Phase II Program (target volume: 8,166,000 gallons, 188% complete). Therefore, significantly more than the full design volume of treatment reagents has been injected in these areas. Phase III injections are ongoing.<br><br>It is acknowledged that not all injection wells perform the same and some are able to achieve higher flowrates at lower wellhead pressures than others based on the permeability of the targeted matrix and the design parameters of the well. Generally, in areas where individual wells did not meet the target volume, nearby and/or | Complete. The requested information is provided in quarterly progress reports. | No additional discussion needed at this time.<br><br>PPG provided NJDEP with a summary table of injection wells that have not reached their target volumes and reasons why in the Q3 2024 Remedial Action Progress Report. |

| NJDEP Issue for GAG Groundwater | | PPG Response | | |
|---|---|---|---|---|
| **Item** | **Description** | **Response** | **Anticipated Completion Date** | **Status as of 3/5/25[1]** |
| | | upgradient injection wells achieved greater than the target volume to compensate, unless performance data supported that a treatment response had already occurred at the targeted monitoring wells within the treatment footprint. Monitoring data in these areas demonstrates success, and none of the "recalcitrant wells" exist in areas where injection wells were underdosed. Design volumes during the PBR application stage are generated based on the density/spacing of the monitoring wells and simplified assumptions about the soil matrix (i.e. same mobile porosity value assumed across the treatment area). The design volumes are intended to be used as a target, but ultimately, performance data at the monitoring wells determines the success of the remedy.<br><br>Ongoing groundwater monitoring (quarterly during post-treatment phase and either semi-annual or annually thereafter) is conducted to evaluate remedy effectiveness. | | |
| d | Where injections were not conducted – PPG and the Department to collaborate on the need for monitoring wells in areas where direct injection has not been performed. A current example of these areas is non-C3 soils within the transition zone. | This item is Haymes Letter Item 4, sub-item 4. As per discussions between NJDEP and PPG in July 2024, this item was in reference to the Lower Deep Zone. Since PPG has agreed to implement a remedy for the Lower Deep Zone (as per Item 5c, Haymes Letter Item 4, sub-item 4), this item has been resolved. NJDEP agreed to this course of action during the July 22, 2024 technical meeting. Introduction of non-C3 soils within the Transition Zone was never contemplated or discussed during the July 2024 technical meetings. | Complete, pending completion of Item 5c. | No additional discussion needed at this time.<br><br>PPG has agreed to prepare a work plan and PBR Application for the Phase I Area near Carteret (Item 5b) and the Lower Deep Zone (Item 5c) followed by implementation of remediation in Q3 through Q4 2025. |
| e | Within and immediately adjacent to low-permeability zones – There are aquifer zones of low permeability which act as storage for contaminants which are released over time into the higher- permeability zones. Wells are required within and immediately adjacent to these storage zones to provide empirical data demonstrating the effectiveness of enhanced attenuation at the site. PPG and the Department to come to consensus on well locations pending identification of | As per discussions between NJDEP and PPG in July 2024, the location of two monitoring wells screened in low permeability materials was agreed upon. These two wells will be installed adjacent to existing wells 114-P2-MW8I/D and 114-P2-MW5I/D as part of Item 5a.<br><br>During these meetings, NJDEP indicated that additional wells would be required to meet long-term monitoring objectives. However, a long-term monitoring plan is premature at this time and is not required until the Remedial Action Report has been approved by the NJDEP. | Two wells are to be installed as part of implementation of Item 5a. Anticipated schedule is Q2 2026. | No additional discussion needed at this time.<br><br>Two wells to be installed are identified in the HPT/VAP Investigation Work Plan, which was submitted to the |

| | | of the enhanced attenuation period post injections. The NJDEP approved RAWP does not indicate that 1,000 ppb Cr(VI) concentrations need to be achieved before a transition to MNA is appropriate and the NJDEP MNA guidance does not stipulate such a requirement. | | |
| 6 | | | | |
| | Fully delineate competent bedrock: PPG recently installed a downgradient competent bedrock well in an effort to complete the bedrock delineation and submitted supporting data to the Department for review. At this time, hydraulic connection has not been demonstrated in the most downgradient well, and vertical delineation may not be fully complete. The Department and PPG are collaborating on the appropriate next steps to demonstrate delineation. Per the 8/8/24 Gantt chart, the Department understands that PPG currently plans to submit a Remedial Investigation Report/Remedial Action Work Plan (RIR/RAWP) Addendum for bedrock in October 2024. | Delineation in the competent bedrock is complete. A scope of work for installation of one additional competent bedrock well between existing wells 114-MW72D and 114-MW76D was agreed upon during a technical meeting between NJDEP and PPG held on September 12, 2024. During this meeting it was also agreed that extrapolation of the 70 ppb Cr contour in bedrock beneath 114-MW72D is appropriate for completion of the bedrock RI based on the data at nearby wells.<br><br>As agreed to by NJDEP during a technical meeting held between NJDEP and PPG on September 4, 2024, no additional bedrock wells beyond the one additional well requested by NJDEP will be required to complete delineation. If the new competent bedrock well does not meet delineation requirements (i.e., Cr concentrations less than 70 ppb and hydraulic connection with the well targeted for delineation [i.e., 114-MW72D]), then a variance from single point compliance (clean point delineation) will be granted by NJDEP to complete the RI for the bedrock. This variance (if necessary) will also support an application for a groundwater remedial action permit. | Completion of field work to delineate bedrock: Q1 2025 | No additional discussion needed at this time.<br><br>Field work to delineate bedrock completed in January 2025.<br><br>Final RIR/RAWP for Bedrock WBZ to be submitted to NJDEP in March 2025. |
| 7 | | | | |
| | Propose a remedy for competent bedrock: Per the 8/8/24 Gantt chart, the Department understands that PPG currently plans to submit a RIR/RAWP Addendum for bedrock in October 2024, within which a remedy for competent bedrock will be proposed. | An active remedy (in situ bioprecipitation via injections of organic carbon substrate) is complete in the weathered and competent bedrock. Also, see response to Item 2a.<br><br>A combined RIR/RAWP for the bedrock water-bearing zone will be submitted upon completion of the additional investigation related to the bedrock described in item 6. | Remedy is complete in the bedrock WBZ | No additional discussion needed at this time.<br><br>Injections in the bedrock WBZ completed on January 3, 2025.<br><br>Final RIR/RAWP Addendum for Bedrock WBZ to be submitted to NJDEP in March 2025. |

Report Suspicious

Hello Frederik,

Based on our review of this technical memorandum, and discussions with NJDEP, we agree with the conclusions as presented. Understanding that PPG plans to soon submit the revised RIR/RAWP for the bedrock water bearing zone, please include within that submittal PPG's proposal for sentinel well monitoring within the weathered bedrock and competent bedrock zones. Also, for any bedrock wells contemplated to be abandoned by PPG in the future, please seek NJDEP's agreement prior to abandoning such wells.

Thanks.
Prabal

Subject: [EXT]:PPG - Technical Memorandum for Hydraulic Testing at 114-MW81D

*** External Message *** -- PROBE message before clicking links or opening attachments.

Good afternoon. Attached for your review please find a draft technical memorandum presenting the findings and conclusions of the pump testing and packer testing conducted at bedrock well 114-MW81D. This memorandum,

once finalized, will be included as an appendix to the revised groundwater Remedial Investigation Report (RIR) and Remedial Action Work Plan (RAWP) addendum for the bedrock water-bearing zone. In summary, we did not identify a hydraulic connection between well 114-MW81D and wells 114-MW72D and 114-MW76D. In addition, below please find a table summarizing the analytical results for groundwater samples recently collected at 114-MW81D (concentrations are in ug/L).

| **Date** | **1/15/2025** | **1/15/2025** | **1/16/2025** | **1/16/2025** | **1/16/2025** | **1/17/2025** |
|---|---|---|---|---|---|---|
| **Depth (ft)** | 103.5 | 107.5 | 115 | 115 | 123 | 127 |
| **Sample Type** | N | N | N | FD | N | N |
| **114-MW81D** | | | | | | |
| Cr | 10 | 10.6 | 9.7 BJ | 10.3 | 10.2 | 10.1 |
| Cr(VI) | 7.4 B | 11 | 3.0 BJ | < 2.6 U | < 2.6 U | 14 |

As previously communicated with the Department, PPG will prepare the final RIR/RAWP addendum pursuant to these findings.

Best regards,

---

Report Suspicious

Good morning,

In an effort to complete delineation of bedrock contamination at the Garfield Avenue Group site 114, following direction from NJDEP, PPG installed several bedrock wells. Groundwater analytical results from 114-MW72D has had variable concentrations of chromium above and below 70 µg/L, and as high as 517 µg/L. Delineation to the south/southwest was attempted since that is the primary groundwater flow direction in the competent bedrock. Bedrock well 114-MW-76D was installed approximately 120 feet southwest of 114-MW72D in order to complete delineation along strike. All groundwater results from well 114-MW76D were ND for chromium. However, the well did not demonstrate any hydraulic connection with 114-MW-72D.

As agreed to by NJDEP during a technical meeting held between NJDEP and PPG on September 4, 2024, no additional bedrock wells beyond one additional well requested by NJDEP would be required to complete delineation. It was agreed that if the new competent bedrock well does not meet delineation requirements (i.e., Cr concentrations less than 70 µg/L and hydraulic connection with the well targeted for delineation [i.e., 114-MW72D]), then a variance from single point compliance (clean point delineation) would be granted by NJDEP to complete the RI for the bedrock. This variance will also support an application for a groundwater remedial action permit.

A scope of work for installation of one additional competent bedrock well between existing wells 114-MW72D and 114-MW76D was agreed upon during a technical meeting between NJDEP and PPG held on September 12, 2024. During this meeting it was also agreed that extrapolation of the 70 µg/L Cr contour

in bedrock beneath 114-MW72D is appropriate for completion of the bedrock RI based on the data at nearby wells.

One open borehole bedrock well (114-MW81D) was completed in the Lockatong Formation from November 14, 2024 to November 21, 2024. A pumping test and packer testing were performed, but PPG did not identify a hydraulic connection between well 114-MW81D and wells 114-MW72D and 114-MW76D.

As agreed in technical meetings, the Department considers delineation in the competent bedrock to be complete. The Department hereby grants a variance from the Tech Rule requirement in N.J.A.C. 7:26E-4.3(a)4: "Delineating the horizontal and vertical extent of all ground water contamination to the ground water remediation standard". The variance is specifically for delineation of the horizontal extent of Cr in groundwater in the competent portion of the Lockatong Formation south/southwest of well 114-MW72D via clean point delineation. Continued groundwater monitoring will be conducted to demonstrate plume stability and, ultimately, compliance with the Ground Water Quality Standards.

The RAR should include, in an Appendix, a copy of this email from the Department, since it clarifies where the variance was granted, and provides the Department's rationale.

David
