HEALTH AND SAFETY PLAN APPROVAL

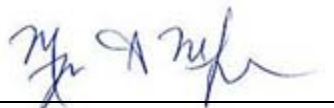

This Program Health and Safety Plan ("HASP") was prepared for AECOM employees performing a specific, limited scope of work. It was prepared based on the best available information regarding the physical and chemical hazards known or suspected to be present on the project site. While it is not possible to discover, evaluate, and protect in advance against all possible hazards, which may be encountered during the completion of this project, adherence to the requirements of the HASP will significantly reduce the potential for occupational injury.

By signing below, I acknowledge that I have reviewed and hereby approve the HASP for the Program. This HASP has been written for the Hudson County Chromate Sites. This HASP has been written for the exclusive use of AECOM employees. The plan is written for specified site conditions, dates, and personnel, and must be amended if these conditions change.

Executive Summary

The purpose of this Health and Safety Plan ("HASP") is to provide a program-wide plan to manage health and safety concerns related to AECOM's activities at various "Hudson County Chromium" sites, located throughout Hudson County, New Jersey pursuant to its responsibilities under 29CFR1910.120 and 29CFR1926. The specific roles, responsibilities, authority, and requirements as they pertain to the safety of employees and the scope of services are discussed herein. The document is intended to identify known potential hazards and facilitate communication and control measures to prevent injury or harm to staff, subcontractors, and the general public. Additionally, provisions to control the potential for environmental impact from these activities are included where applicable.

Scope of Work

The scope of work associated with the Hudson County Chromium Program may include the following:

- Construction oversight;
- Health and Safety oversight;
- Engineering oversight;
- Implementing the air monitoring plan; and
- Assisting in waste management/records management.
- Oversight of the installation of soil borings, via direct-push and conventional drilling methods;
- Physical characterization and sampling of soil samples from soil boring activities;
- Soil boring installation may also include the oversight of non-mechanical excavation for utility clearance via soft dig (vactron/air knife) of at least the upper five (5) feet at selected soil boring locations;
- Collection of environmental samples from soil, groundwater, air, surface water, waste, concrete and other matrices;
- Conduct an air monitoring program for particulates, volatile organic compounds ("VOCs") and other potential contaminants during all investigation activities.
- Oversight of environmental test pits and environmental trenching which includes excavation, stock piling and backfilling material.
- Conduct in-situ pilot tests and oversight of joint pilot tests conducted by other contracted consultants.
- Oversight and direction of subcontractor installation and abandonment of temporary and permanent wells for monitoring, extraction, or injection and development of installed wells;
- Gauging, purging and sampling of groundwater monitoring wells;
- Geophysical and hydrologic testing of wells;
- Management of Investigative Derived Waste ("IDW");
- Oversight and direction of surveying services;
- Physical interior and exterior property inspection by AECOM where AECOM is accompanied by the resident, property owner, or an authorized representative for the purposes of identifying visual evidence of Chromate Chemical Production Waste ("CCPW") or other environmental impacts across the site, on the exterior of any structures as well as the interior of ground floor and basement or crawl space, if present.
- Oversight of the installation of interim remedial measures ("IRM") and continued quarterly inspection and maintenance of all installed IRMs.

Physical Hazards

The primary physical hazards which may be encountered may include:

- Struck by motor vehicles, construction equipment or material handled,
- Slips trips and falls on the same level,
- Falls from elevations,
- Caught in/between,
- Underground and overhead utilities,
- Electrical hazards,
- Biological hazards,
- Noise Exposure, and
- Heat stress and cold stress.

Contaminates of Concern

The primary contaminant of concern is:

- Hexavalent chromium and chromium byproducts.

The secondary contaminants of concern include:

- Various metals (Vanadium, Antimony, Nickel, Arsenic) – associated with chromium production and historic fill;
- VOCs – associated with historic site and MGP facility operations;
- SVOCs – associated with historic site and MGP facility operations;
- PAHs – associated with historic fill;
- Pesticides – associated with historic site operations and fill;
- PCBs – associated with historic site operations.

Task Hazard Analysis

As a supplement to the Program HASP, a Task Hazard Analysis (“THA”) will be prepared for each activity proposed for a specific site by the field task leader. The THA for each activity will be reviewed by the Site Safety Officer (“SSO”) prior to being implemented. Once approved, the completed THA will be reviewed with all field personnel during the daily safety meeting to ensure it is specific to the needs of the current site conditions.

Task Specific Safety, Health & Environment (“SH&E”) Procedures

As discussed in this HASP, AECOM personnel may be exposed to a variety of chemical, physical, and radiological hazards resulting from task or equipment-specific activities. The controls for many of these hazards are discussed in Standard Operating Procedures (“SOPs”) found in the **Series 300 to 500** North America SH&E SOPs (refer to Appendix F).

AECOM employees are bound by the provisions of this HASP and are required to participate in a preliminary project safety meeting to familiarize them with the anticipated hazards and respective onsite controls. The discussion will cover the entire HASP subject matter, putting emphasis on critical elements of the plan; such as the emergency response procedures, personal protective equipment, site control strategies, and monitoring requirements. In addition, daily tailgate safety meetings will be held to discuss: the anticipated scope of work, required controls, identify new hazards and controls, incident reporting, review the results of inspections, any lessons learned or concerns from the previous day.

1.0 Introduction

1.1 HASP Purpose

This Health and Safety Plan ("HASP") provides a clear plan to promote safe and healthful working conditions by identifying and controlling physical, chemical and biological hazards; to prevent work related injury, accidents, and damage to physical property or the environment; to create a plan to manage H&S incidents and emergencies; and to communicate potential hazards to employees or subcontractors working on the Hudson County Chromium Program.

1.2 General

The provisions of this HASP are mandatory for all AECOM personnel engaged in fieldwork associated with the environmental services being conducted at the subject site. In the event of a conflict among this HASP, AECOM Safety, Health & Environment ("SH&E") Standard Operating Procedures ("SOPs") and federal, state, and local regulations, workers shall follow the most stringent/protective requirements. Concurrence with the provisions of this HASP is mandatory for all personnel at the site covered by this HASP and must be signed on the acknowledgement page found in **Appendix A**.

1.3 Policy Statement

AECOM is committed to protecting the safety and health of our employees and meeting our obligations with respect to the protection of others affected by our activities. We are also committed to protecting and preserving the natural environment in which we operate. The safety of persons and property is of vital importance to the success of these projects and accident prevention measures shall be taken toward the avoidance of waste and loss. It shall be the policy of these projects that all operations be conducted safely. Field Operations Managers ("FOMs") and/or Construction Managers ("CMs") are responsible for those they supervise by maintaining a safe and healthy working environment in their areas of responsibility, and by fairly and uniformly enforcing safety and health rules and requirements for all project personnel. All reasonable and practical measures shall be taken to promote safety and maintain a safe working environment. Contractors are wholly responsible for the prevention of accidents on work under their direction and shall be responsible for thorough safety and loss control programs and the execution of their own safety plans for the protection of workers.

1.4 AECOM Subcontractors

The requirements for subcontractor selection and subcontractor safety responsibilities are outlined in S3NA-213-PR Subcontractors. Each AECOM subcontractor is responsible for assigning specific work tasks to their employees. Each subcontractor's management will provide qualified employees and allocate sufficient time, materials, and equipment to safely complete assigned tasks. In particular, each subcontractor is responsible for equipping its personnel with any required personnel protective equipment ("PPE") and all required training.

AECOM considers each subcontractor to be an expert in the aspects of the work operations for which they are tasked to provide, and each subcontractor is responsible for compliance with the regulatory requirements that pertain to those services. Each subcontractor is expected to perform its operations in accordance with its own unique safety policies and procedures, in order to ensure that hazards associated with the performance of the work activities are properly controlled. Copies of any required

safety documentation for a subcontractor's work activities will be provided to AECOM for review prior to the start of onsite activities.

Hazards not listed in this HASP but known to any subcontractor, or known to be associated with a subcontractor's services, must be identified and addressed with the AECOM Project Manager ("PM") or the FOM or CM prior to beginning work operations. The FOM, CM or authorized representative has the authority to halt any subcontractor operations, and to remove any subcontractor or subcontractor employee from the site for failure to comply with established health and safety procedures or for operating in an unsafe manner.

1.5 HASP Modification

Should significant information become available regarding potential on-site hazards, it will be necessary to modify this HASP. All proposed modifications to this HASP must be reviewed and approved by the AECOM Regional Safety, Health & Environment Manager ("RSHEM") before such modifications are implemented. Any significant modifications must be incorporated into the written document as addenda and the HASP must be reissued. The AECOM PM will ensure that all personnel covered by this HASP receive copies of all issued addenda. Additionally, the HASP will be re-assessed for regulatory compliance and accuracy of its content one-year from the date of issuance.

1.6 Task Hazard Analysis

As a supplement to this Program HASP, a Task Hazard Analysis ("THA") will be prepared for each activity proposed for a specific site. The guidance for THA creation can be found in [S3NA-209-PR Project Hazard Assessment and Planning](#). Upon initiation of each work activity planned for the field, the selected Field Team Leader will develop a THA(s) for the specific work to be conducted. THAs can be saved and recycled for similar types of work, but must be reviewed and updated for each event. THA(s) will be sent to the Task Leader, PM, Field Ops Manager, Program H&S Manager, and the program SSO for review. The THA for each activity will be approved by the Site Safety Officer ("SSO") prior to being implemented. Once approved, the approved THA will be reviewed with all field personnel during the daily safety meeting to describe the specific H&S requirements of the tasks to be completed that day. A blank THA is presented in **Appendix B**.

1.7 HASP Availability

This HASP, applicable THAs, and other HASP addenda, including Material Safety Data Sheets ("MSDS"), may be printed out and placed in a binder for review or, if available, electronic copies can be kept on a lap top or tablet as long as site personnel are informed of their availability and how to access the documents. Applicable AECOM SHE SOPs are provided in **Appendix F** and are available via AECOM's intranet website.

1.8 Simultaneous Activities

During the course of the Hudson County Chrome Program, AECOM will be performing services simultaneously to other Contractors hired by PPG Industries Inc. ("PPG"). AECOM's first priority is the safety of their employees. Where simultaneous operations are taking place, AECOM PMs, FOMs, and/or CMs will coordinate their activities with other contractors.

Under the requirements of the Occupational Safety & Health Administration ("OSHA"), each employer is required to provide a safe and healthful working environment for employees. When several employers

are working simultaneously on the project, the activities of one employer could expose personnel of another company to a hazard.

Where an employer creates unsafe conditions, the exposing employer shall be responsible for exercising reasonable diligence to discover the condition, and for taking steps to protect their personnel and others working in the area. When the exposing employer has authority to correct the hazard, it shall do so. Where the exposing employer lacks the authority to correct the hazard, the employer shall ask the creating and/or controlling employer to correct the hazard; inform its personnel of the hazard; and take reasonable alternative protective measures. In extreme circumstances (e.g., imminent danger situations), the exposing employer shall remove their personnel from the area to avoid the hazard.

1.9 AECOM Safety Role

AECOM personnel shall not direct/manage the health and safety aspects of the work performed by contractors hired by PPG. If a possible safety hazard created by the contractor is observed, the AECOM representative should notify the contractor's onsite manager of the potential hazard only and not provide guidance or direction on how to correct the hazard. The safety hazard and corrective action should be documented by the SSO or FOM. If the hazard poses an imminent danger (condition where there is a reasonable certainty that a danger exists that can be expected to cause death or serious physical harm) to contractor's employees, the AECOM representative should stop the work and immediately notify the contractor's onsite manager the reason for stopping the work. If the contractor fails to correct the situation AECOM will immediately notify (verbally) the PPG contact of the hazardous situation. Verbal notification should be followed up by written notification. The initial stop work recommendation and the corrective action should be documented by the SSO or FOM.

1.10 Stop Work Authority

All employees have the right and duty to stop work when conditions are unsafe and to assist in correcting these conditions as outlined in [S3NA-002-PR Stop Work Authority](#). Whenever the SSO determines that workplace conditions present an uncontrolled risk of injury or illness to employees, immediate resolution with the appropriate supervisor shall be sought. Should the supervisor be unable or unwilling to correct the unsafe conditions, the SSO is authorized and required to stop work, which shall be immediately binding on all affected AECOM employees and subcontractors.

Upon issuing the stop work order, the SSO shall implement corrective actions so that operations may be safely resumed. Resumption of safe operations is the primary objective; however, operations shall not resume until the Safety Professional has concurred that workplace conditions meet acceptable safety standards.

2.0 Project Description

2.1 Site History

The Hudson County Chromate Chemical Production Waste Sites are located throughout Jersey City, Bayonne, and in surrounding towns in both Hudson and Essex Counties, New Jersey. The NJDEP has identified over 160 sites that are contaminated with chromite ore processing residue ("COPR"), also known as chromate waste. The chromate chemical production waste has been found at residential, commercial and industrial locations. The more than two million tons of waste disposed of over the area were generated by three chromite ore-processing plants which operated for approximately 70 years between 1905 and 1971. One of the plants, located in Hudson County, was owned and operated by PPG at its former chromium chemical production facility location at Garfield Avenue in Jersey City.

The chromate waste was used as fill in preparation for building foundations, construction of tank berms, roadway construction, filling of wetlands, sewer line construction and other construction and development projects. Chromate contamination has been found in a variety of places including the walls and floors of buildings, interior and exterior building surfaces, surfaces of driveways and parking lots and in the surface and subsurface of unpaved areas.

2.1.1 Site 016

Site 016 is located at 45 Linden Avenue East, Jersey City, New Jersey. Site 016 is approximately 12.9 acres comprised of a warehouse used for storing and shipping various materials or retail items (approximately 7.5 acres); asphalt cover area (approximately 2 acres); and unpaved areas (approximately 3.4 acres). Based on visual and analytical evidence, Site 016 had been partially filled with CCPW and/or CCPW-impacted material and was contaminated with chromium to a depth of about three feet bgs. CCPW was not encountered in any of the borings advanced inside of the Site 016 warehouse building, but, CCPW and CCPW-impacted materials were identified on the Site outside of the building. PPG began implementing additional IRMs (soil excavation in two areas along the east side of the warehouse building) at Site 016 in 2008-2009 including fencing and paving of the access road to the north of the Site installed to cover COPR containing soils. On site total chromium levels in soil ranged from < 100 to 15,500 mg/kg, and hexavalent chromium concentrations in soil ranged from ND to 709 mg/kg. Total chromium was detected at concentrations of non-detectable ("ND") to 2750 ug/l and hexavalent chromium was detected at concentrations of ND to 89 ug/l in unfiltered groundwater samples.

2.1.2 Site 063 and 065

Sites 63 and 65, located at 1 Burma Rd Jersey City, NJ, were determined to be potential sites of chromium contamination and listed as part of the Group 12 Hudson County Chrome sites. NJDEP collected a surface scraping sample from the base of the loading dock on the west side of the Baldwin Oil warehouse building on December 14, 1987. The total Cr concentration in the sample was 3,150 ppm. NJDEP collected a soil sample on February 22, 1988 north of utility pole #67563 near the edge of Burma Road from a depth of 4 to 6 inches below the asphalt. The concentration of total Cr in this sample was 910.3 mg/kg. It was determined that the fill beneath the building contained CCPW material. In 1998-1999, IRMs were implemented to demolish the building and included removal of the building's concrete floor slab and loading dock floor slab, removal of the CCPW-impacted fill, installation of a HDPE liner, backfilling, and grading. Drainage channels on the western and eastern sides of the site

were remediated and upgraded during the IRM to prevent CCPW impacts from entering the storm water collection system. A fence was installed around the Site to prevent unauthorized access. CCPW was visually identified in all 16 of the borings advanced through the building foundation, but was not found in any of the borings surrounding the platform. The highest concentrations of Cr+6 were detected in the middle of the building, toward the northern side. No Cr+6 exceeding 100 mg/kg IRM action level was detected in the borings advanced outside of the building. Total chromium was detected in groundwater at a concentration of 16.5 ug/L, and Cr+6 was not detected.

2.1.3 Site 107

Site 107 is located at 18 Chapel Avenue in Jersey City, NJ. The NJDEP conducted an inspection of Site 107 in January 1988 and identified yellow and green crystals on the exterior walls of the building. The total chromium results for soil samples ranged in concentration from 20 mg/kg to 11,000 mg/kg. The State of New Jersey Department of Health ("NJDOH") conducted an investigation of the building interior in May 1989 and reported yellow and white crystals on the walls of the building. Three "scrape samples" collected from the walls by NJDOH reported total chromium analytical results ranging from 54 to 4,660 mg/kg. PPG implemented IRMs at Site 107 in 1992 including the installation of polyethylene plastic and plywood coverings over contaminated interior building areas. Asphalt pavement was installed at exterior locations on the south side and northwest corner of the Site 107 building. Soil samples reported analytical results for total chromium ranging from 304 to 7,040 mg/kg. The repair and replacement work conducted by PPG in 1999 remedied the areas capped and sealed during the initial IRM work allowing the removal of the initial IRMs. The maximum concentrations reported for post-excavation samples were reported at a concentration of 7,550 mg/kg for total chromium and 8,540 mg/kg for hexavalent chromium. Additional IRMs conducted between 1999 and 2003. Soil samples were collected and temporary wells were installed and groundwater was sampled at Site 107 in September 2010. Total chromium ranged from 13.7 to 749 mg/kg, and hexavalent chromium concentrations ranged from ND to 390 mg/kg in soil samples collected during the September 2010 sampling event. Total chromium concentrations ranged from ND to 2690 ug/L, and hexavalent chromium was ND in groundwater samples collected during the 2010 sampling event.

2.1.4 Site 108

Site 108 is located at 20 Linden Avenue East in Jersey City, NJ. Minimal CCPW-related contamination was reported on Site 108 during previous investigations by Tapash Environmental Consultants in 2007; however, the extent of CCPW-related impact has not been fully determined. Tapash reported chromium at 139 ug/L in a groundwater sample collected from temporary monitoring well SB-7 located within the southern portion of the Site 108 building. A remedial investigation was conducted by Dresdner Robin in 2011 to further delineate the previously reported contamination.

2.1.5 Site 112A

Site 112A (Liberty National Golf Course) is located at 3 Linden Avenue East, in Jersey City, New Jersey. Previous sampling results indicate that total chromium was detected in Site 112A soils at a concentration of < 100 to 43,400 mg/kg, and hexavalent chromium was detected in soil at a concentration of ND to 12,800 mg/kg. Total chromium was detected in site groundwater at concentrations of ND to 6,410 ug/L, and hexavalent chromium was detected at concentration of ND to 7,220 ug/L. During recent sampling conducted on October 10, 2011, total chromium was detected in aqueous samples at a concentration of ND to 29.9 ug/l, and hexavalent chromium was ND in these samples.

2.1.6 Site 114 - Chromate Production Facility

Site 114 is located at 70 Carteret Avenue in Jersey City, NJ. The western half of Site 114 was the location of a chromate production facility from 1924 to 1963. Products produced at the plant included aluminum hydrate, sodium chromate, sodium bichromate, sodium sulfate, vanadium pentoxide and potassium bichromate. In 1964, the chromate chemical production facility was dismantled.

The residue remaining after the leaching of the roast constituted the only waste produced at the chromate plant. This waste is referred to as "chromate ore processing residue" or COPR. Some COPR was recycled through the process, but the majority was stockpiled on the southeast corner of Site 114 and on adjacent PPG Site 137, or used as fill material to close the Morris Canal. In addition, some material was transported to other Hudson County sites and was used as fill for other purposes.

2.1.7 Site 114 - Manufactured Gas Plant ("MGP")

Site 114 is located at 70 Carteret Avenue in Jersey City, NJ. The northeastern portion of Site 114 was the location of a manufactured gas plant ("MGP") that operated from 1886 to the mid-1930s. The MGP used the coal gas process, the water gas process and the carbureted water gas process. The most likely wastes generated at the MGP included: ash, clinker, iron oxide sponge, coke, tar, pitch, drip oil, ammonium sulfate, sulfur, and ammonia liquor.

2.1.8 Site 132

Site 132 is located at 91 Carteret Avenue in Jersey City, NJ. On Site 132 (Town & Country Linen), an Interim Remedial Measures ("IRM") [pavement cover and fencing] were installed between 1990 and 1992. A Remedial Investigation Workplan was submitted to New Jersey Department of Environmental Protection ("NJDEP") in 2006, and remedial investigation fieldwork was completed in 2007. Hexavalent chromium was detected in soil at levels up to 20,900 milligrams per kilogram ("mg/kg") of hexavalent chromium. Total chromium was detected in site groundwater at levels up to 85 parts per billion ("ppb") for total chromium. The IRMs (pavement cover and fencing) are inspected on a quarterly basis. Site 132 is proposed to become part of the PPG Carteret South Project.

2.1.9 Site 133

Site 133 includes 15 Halladay Street and 2-72 Halladay Street in Jersey City, NJ. On Site 133 (Ross Wax), an IRM [interior wall and floor coverings and exterior pavement] were installed in 1991. A Remedial Investigation Workplan was submitted to NJDEP in 2006, and remedial investigation fieldwork was completed in 2007. Hexavalent chromium was detected in site soil at levels up to 11,900 mg/kg of hexavalent chromium. Total chromium was detected in site groundwater at levels up to 7,000 ppb total chromium in the adjacent right-of-way. The interior and exterior IRMs at Site 133 are inspected on a quarterly basis. 15 Halladay was part of the due diligence investigation conducted in early 2012.

2.1.10 Site 135

Site 135 is located from 51-99 Pacific Avenue in Jersey City, NJ. On Site 135 (Vitarroz), a Remedial Investigation Workplan was submitted to NJDEP in 2006, and remedial investigation fieldwork was completed in 2007. Hexavalent chromium was detected in site soil at levels up to 20 mg/kg of hexavalent chromium. On Site 135, hexavalent chromium was detected at 20.1 mg/kg in only one sample (PPG-135-MW1C). Total chromium was detected in site groundwater at levels up to 114 ppb for total chromium.

2.1.11 Site 137

Site 137 is located at 25 Halladay Street and 45 Halladay Street in Jersey City, NJ. On Site 137 (Rudolf Bass) at 45 Halladay Street, IRM [interior wall and floor coverings; and exterior pavement] were installed between 1990 and 1992. A Remedial Investigation Workplan was submitted to NJDEP in 2006, and remedial investigation fieldwork was completed in 2007. Hexavalent chromium was detected in site soil at levels up to 29,300 mg/kg of hexavalent chromium. Total chromium was detected in site groundwater at levels up to 19,000 ppb for total chromium.

On Site 137 (Rudolf Bass) at 25 Halladay Street, a Remedial Investigation Workplan was submitted to NJDEP in 2006, and remedial investigation fieldwork was completed in 2007. The property has a building on it and is presently being used for light industrial purposes. Hexavalent chromium was detected in site soil at levels up to 26,000 mg/kg of hexavalent chromium. Total chromium was detected in site groundwater at levels up to 5,300 ppb for total chromium. Interim remedial measures were implemented at Site 137 and engineering controls have been installed within the building interior and exterior to address observed chromium impacted surfaces. The IRMs are inspected on a quarterly basis. 25 Halladay was part of the due diligence investigation conducted in early 2012.

2.1.12 Site 143

Site 143 is located at 846 Garfield Avenue in Jersey City, NJ. On Site 143 (Talarico Auto), an IRM (exterior covering) was installed between 1990 and 1992. A Remedial Investigation Workplan was submitted to NJDEP in 2006, and remedial investigation fieldwork was completed in 2007. Hexavalent chromium was detected in site soil at levels up to 1,530 mg/kg of hexavalent chromium. Total chromium was detected in site groundwater in the adjacent right of way at levels up to 25,000 ppb for total chromium. Site 143 was part of the due diligence investigation conducted in late 2011.

2.1.13 Site 146

Site 146 formerly contained a stockpile of CCPW reportedly covering an approximate 100 foot by 200 foot area partially beneath Commerce Street and on portions of the properties to the east and west of Commerce Street in Bayonne, NJ. NJDEP performed a site inspection at the foot of Commerce Street on May 15 and May 23, 1990 and found three small areas suspected to contain CCPW. As a result of these inspections, Site 146 was listed as one of the Group 13 HCC sites and a joint inspection of the Site was conducted by NJDEP and PPG. Following these inspections, IRM activities were performed in 1991. Concentrations of total chromium in surface soil samples were detected at a maximum concentration of 223 mg/kg at the northernmost location. IRMs included removal of piles of CCPW and asphalt capping of an 80-foot by 45-foot area in order to eliminate the possibility of exposure to CCPW. The asphalt cap extends on both sides of the roadway (Commerce Street) at the approach to the Kill Van Kull and adjacent fencing. No additional soil data for Site 146 was provided in available Site investigation/remediation references.

2.1.14 Site 147

Site 147 is located at 2 Port Imperial Boulevard in Weehawken, NJ. Since approximately 1880, the site has been reclaimed from the Hudson River via man made fill activities. The materials utilized for the fill included sand, brick, construction debris, blast roc, wood, cinders, coal ash, coal and COPR. In concert with the fill activities the site was utilized for various industrial activities including, but not limited to, ship loading and above ground storage facilities. Greater detail regarding the historic site activities and ownership can be found in the Remedial Investigation Work Plan (RIWP) prepared by ICF Kaiser and REM in September 1993. With the Remedial Investigation completed at the site, a site-wide remediation was conducted that included excavation and capping. The remediation also included converting the

property to a waterfront public park, which is how the site appears today. The contaminants of concern on site consist of volatile organic compounds ("VOCs") and metals (arsenic). The sampling program in place is designed for monitoring only; most levels of contaminants detected are below standard levels.

2.1.15 Site 156

Site 156 is located at 280 Marin Boulevard in Jersey City, NJ. On Site 156 (Metropolis Towers, also known as Gregory Park Apartments), a Remedial Investigation Report was submitted to the NJDEP in 1994. Additional investigation work was completed in 2006-2007. The Remedial Design and Remedial Action Workplan were submitted to the NJDEP in 2006. Impacted soil is primarily located beneath parking areas and recently demolished buildings. There are no known soil impacts beneath the residential towers. Soil samples collected during Langan remedial investigations indicated that samples contained total chromium concentrations ranging from not-detected ("ND") to 12,100 mg/kg; and hexavalent chromium was detected in soil samples at a concentration range of ND to 8,910 mg/kg. Total chromium has been detected in one groundwater monitoring well at levels up to 1,630 ppb for total chromium. In all other wells, total chromium groundwater concentrations have been below the Ground Water Quality Standards ("GWQS") for chromium. During additional soil and sediment sampling conducted at Site 156 in September-October 2011, hexavalent chromium concentrations ranged from ND to 2,980 mg/kg, and total chromium concentrations ranged from 5.5 to 17,000 mg/kg.

2.1.16 Site 174

Site 174 is located at 100 West 1st Street in Bayonne, NJ. On Site 174 (Dennis Collins Park), NJDEP first conducted soil sampling at the Site in response to information from a citizen during the summer of 1992. During the investigation, NJDEP discovered a pocket of material potentially indicative of the presence of CCPW at an approximate depth of 2 feet bgs in the face of an embankment along the shoreline of the Site. Total Cr analysis was completed on one soil sample collected on June 18, 1992, and total Cr was detected at a concentration of 4,760 mg/kg. The investigation did not include analysis for Cr+6. Additional investigations were conducted between 1992 and 1993 with total chromium concentrations in soil ranging from ND to 1,630 mg/kg. The areas with the highest concentrations of total Cr and Cr+6 were located along the 48-inch diameter underground sewer piping southwest of the restroom and adjacent to the Kill Van Kull. IRMs installed in 1993 included the placement of approximately 300 tons of rip-rap material along a portion of the Kill Van Kull shoreline near the sewer outfall, and the installation of approximately 600 square feet of a bituminous concrete/Permalon liner cap approximately 10 feet southwest of the restroom structure.

Between 1998 and 2002, additional sampling was conducted resulting with a maximum total chromium concentration of 2,130 mg/kg, and hexavalent chromium concentrations ranged from not detected to 30.5 mg/kg. Other metals detected in the soil samples above NJDEP soil remediation standards included antimony, beryllium, nickel, and vanadium which were above the NJDE RDCSRS but below the NRDCSRS. Total chromium concentrations were less than the total chromium GWQS of 70 µg/L in all samples analyzed; however, thallium and nickel were detected in groundwater samples above their respective GWQS.

A "Preliminary Site Characterization Report with Final Site Characterizations, Hudson County Chromate Sites, Group I, Remediation Investigation" was submitted to the NJDEP in June 2001. A "Final Remedial Investigation Report, Hudson County Orphan Site, Group 1, Site 174, Dennis P. Collins Park, Remedial Investigation and Remedial Alternative Selection Evaluation" was submitted to NJDEP in October 2003. Hexavalent chromium has been detected in site soil at levels up to 31 mg/kg for hexavalent and total chromium. Groundwater levels for total chromium were below the GWQS for chromium.

2.1.17 Site 186

Site 186 is located at 947 Garfield Avenue in Jersey City, NJ. On Site 186, Garfield Avenue No. 1 (Orphan Site), a Final Remedial Investigation Report was submitted to the NJDEP in 2003. Hexavalent chromium has been detected in site soil at levels up to 18 mg/kg. Groundwater levels for total chromium were below the GWQS for chromium on site. During sampling investigations conducted in 1997 by L. Robert Kimball & Associates ("Kimball"), antimony was detected in soil at levels up to 40 mg/kg, lead concentrations were detected in soil at levels up to 529 mg/kg, and vanadium was detected in soil at concentrations up to 416 mg/kg above their respective NJDEP Soil Remediation Standards (N.J.A.C. 7:26D), ("SRS"). Hexavalent chromium was not detected above 20 mg/kg, the most stringent Soil Cleanup Criteria for Chromium (hexavalent). Aluminum (7,570 ppb), manganese (48,400 ppb), sodium (117,000 ppb), lead (47 ppb) and iron (10,500 ppb) were detected at a maximum concentration above the GWQS in one or both wells installed and sampled (unfiltered) by Kimball.

2.1.18 Site 202

On Site 202 (Caven Point Realty), no remedial investigation activities have been completed by PPG. As a result, no data is available.

2.1.19 Site 203

On Site 203 (Claremont Associates), no remedial investigation activities have been completed by PPG. As a result, no data is available.

2.1.20 Site 204

On Site 204 (Conrail Edgewater Branch railroad right-of-way), no remedial investigation activities have been completed by PPG. As a result, no data is available.

2.1.21 Site 207

Site 207 is located in the Berry Lane Park Area and is located between Garfield Avenue, Communipaw Avenue, Woodward Street and the NJ Transit Light Rail Line in Jersey City, NJ. On Site 207, Garfield Avenue No. 2 (Orphan Site), hexavalent chromium has been detected in site soil at levels up to 332 mg/kg of hexavalent chromium. Total chromium was detected in site groundwater at levels up to 240 ppb for total chromium. Recent site investigation activities conducted by Jersey City Redevelopment Authority also indicate that there are chromium impacts; however, the reports generated from these activities have not been completely reviewed. Reach Associates soil boring data collected in 1997 indicates that on Site 207, total chromium was reported at a maximum total chromium concentration of 26,863 mg/kg and hexavalent chromium concentration was reported at a concentration greater than 332 mg/kg at sample location RAI-9B. At Reach Associates soil boring RAI-3B, total chromium concentrations were reported at 24,101 mg/kg and hexavalent chromium soil concentrations were reported at 61.2 mg/kg.

2.1.22 Berry Lane Park Area

Sites 121 and 207 are situated within the Berry Lane Park Area and are located between Garfield Avenue, Communipaw Avenue, Woodward Street and the NJ Transit Light Rail Line in Jersey City, NJ. Soil and groundwater sampling activities were also conducted by Langan Associates ("Langan") on various properties (Property 3, 4, 5, 6, 7, 8 & 9) within the Berry Lane Park Area. Several volatile organic compounds, polycyclic aromatic hydrocarbons ("PAHs") and metals were detected in soil above the NJDEP SRS at the maximum concentrations summarized below:

- Total petroleum hydrocarbons (5,830 parts per million (“ppm”))
- Benzene (2.26 ppm)
- Naphthalene (13.1 ppm)
- Benzo(a)anthracene (1.76 ppm)
- Benzo(a)pyrene (1.31 ppm)
- Benzo(b)fluoranthene (1.61 ppm)
- Arsenic (25.3 ppm)
- Lead (1,817 ppm)
- Hexavalent chromium
 - Property 5 sample location P5-SB1 (11,500 ppm)
 - Property 8 sample location P8-SB2 (12,600 ppm)

In groundwater samples collected by Langan from Properties 3, 4, 5, 6, 7, 8, & 9, the following compounds were detected at concentrations above the GWQS at one or more location:

- Benzene (2,270 ppb)
- Toluene (6,680 ppb)
- Ethylbenzene (3,470 ppb)
- Xylenes (11,730 ppb)
- Naphthalene (705 ppb)
- tert-Butyl Alcohol (418 ppb)
- Hexavalent chromium (200,000 ppb) – Property 5 well location P5-GWHEX(P5-SB4)

2.1.23 Additional Sites

During the Hudson County Chrome Program, additional sites may be identified that will require investigation by AECOM. When these sites are identified, the historical background information can be added in **Appendix D** and a site-specific THA will be created according to AECOM's scope of work for the Hudson County Chrome Project. If the scope of work at the new site does not fall under a scope of work designed in this HASP, the Hudson County Chrome Program HASP will have to be revised to include the new scope of work before the work can be conducted.

2.2 Scope of Work for Garfield Avenue Group Sites

AECOM has been retained by PPG to conduct construction management activities during Remedial Action Work Plan (“RAWP”) activities at the Garfield Avenue Group of Sites. The activities being conducted during the proposed RA are detailed in attached RAWP. The RAWP activities include surface concrete slab removal, subsurface debris and mass source waste removal. A separate HASP for the IRM#1 dated February 2010 was developed for IRM Activities. Since Feasibility Study activities are anticipated to occur while RAWP activities are ongoing, this HASP incorporates the requirements from the previous IRM #1 HASP.

2.2.1 AECOM's Scope of Work for Garfield Avenue Group Sites

As part of the construction management task, AECOM's scope of work includes:

- Monitoring AECOM's contractor's performance and compliance with the contract requirements;
- Oversight of field activities to monitor whether work is being performed in accordance to work plan and/or other approved documents;

- Implementing the air monitoring plan; and
- Assisting in waste management/records management.

2.2.1.1 Overview of RAWP, Interim Remedial Measures and Feasibility Study ("FS") Activities

Site activities will include the following:

- Conducting the excavation work
 - Southwest Excavation ("SW TEP") will consist of a mass removal excavation and associated sampling and disposal activities;
 - RAWP – Remaining portion of the Garfield Avenue Sites (with exception of Site 186) Excavation will consist of a mass removal excavation and associated sampling and disposal activities;
- Conducting a Backfill Amendment treatment full scale application using FerroBlack-H; and
- Conducting an In-Situ Groundwater treatment using biological amendments.

Many of these activities will be occurring at the same time.

The proposed RAWP and the SW TEP work is comprised generally of mass removal actions but also includes waste characterization activities and geotechnical investigation activities. The mass removal actions which will be performed consist primarily of dewatering, shoring installation, excavation, backfilling and regrading. The SW TEP focuses on the Southwest portion of the site and the Morris Canal area adjacent to the Southwest area and IRM#1. PPG's Remediation Contractor will perform the construction-related activities for the project. Amended backfill is approved for use within a portion of the former Morris Canal area and will follow the applicable health and safety and storage and handling procedures discussed in **Appendix H**.

Previous FS work that was comprised of pilot scale studies were used to evaluate remedial technologies. The successful studies, using FerroBlack-H, will be used to model the current full scale Backfill Amendment. Treatment activities which will be performed consist of excavation, ex-situ and in-situ soil treatment, and groundwater injection. Work will be performed by a combination of contractors including an excavation contractor, and firms with specialty treatment technologies. **Appendix H** provides a description of the treatment applications and health and safety guidelines to be followed during these activities at Site 114.

During the remedial activities, groundwater extracted from the excavation areas will be stored onsite in 250,000 gallon modular tanks or other approved containers containing groundwater extracted from onsite excavation activities for treatment by the on-site water treatment facility or disposal by tanker trucks. Groundwater will be disposed of as hazardous waste and transported to an appropriately licensed disposal facility if the treatment system is not operating.

2.2.2 Project Duration and Shifts Work

The start of this project was in June, 2010 with field work expected to continue through December 2014. Limited post-treatment sampling will continue after excavation activities. Field work typically takes place Monday through Friday from 0700 to 1500 hours, but may last until 1900 hours. Work on Saturday may be required; however, work will not generally take place after dark or on weekends or major holidays. AECOM expects to staff the project with approximately eight to twelve people.

2.2.3 AECOM Contractors

As required by AECOM policy and procedures, subcontractors to AECOM are pre-qualified based on their prior experience with AECOM, total OSHA injury and illness rate, as provided on their OSHA 300A Form for the past three years, experience modification rate (EMR of less than 1) and their corporate safety program. A copy of their corporate safety program is technically reviewed by the RSHEM Manager. Subcontractors to AECOM are also required to submit Job Safety Analysis ("JSAs")/THA and a project HASP for acceptance by AECOM.

Subcontractors are required to provide a safe and healthful working environment for employees that are free from recognized hazards that are causing or likely to cause harm to their employees and other project personnel.

AECOM will be performing most of the In-Situ groundwater injection pilot study work. Subcontractors (to be determined) will include drilling, electrical, and plumbing subcontractors.

Contractors who AECOM has retained for this project and their area of expertise are as follows:

Contractor	Expertise/Scope of Work
Borbas Surveying and Mapping	Survey of all site features
EAI	Provide air monitoring support
SGS Environmental Services	Subsurface drilling and well installation
D'elia Electric	Electrician for on-site wiring and connection

2.2.4 PPG Contractors

The environmental construction contractors and the remediation/treatment contractors who will be performing the feasibility study work will be subcontracted directly to PPG. The PPG contractor is responsible for their staff's health and safety, although AECOM has stop-work authority as will be specified in their contract to PPG. Subcontractors acquired by PPG contractors are responsible for their staff's health and safety and will adhere to the project-specific SH&E documentation agreed upon by PPG and their contractor.

Contractors who PPG has retained for this project and their area of expertise are as follows:

Contractor	Expertise/Scope of Work
<i>Contractor to be determined</i>	RAWP Excavation work and Backfill Amendment
ENTACT (including subcontractors)	SW TEP Excavation work and Backfill Amendment
ARCADIS	In-Situ Soil Treatment H ₂ SO ₄ /Bio
AquaBella	Water treatment
WTS (including subcontractors)	Waste management services
Clean Earth	Waste disposal services

2.3 Scope of Work for Environmental Site Investigations

The PPG Non-Residential Chromium Remediation Project consists of approximately twenty chromium-contaminated properties located in Hudson County, New Jersey. Under the terms of an Administrative Consent Order (“ACO”) between PPG and the NJDEP, these properties are to be investigated for soil and groundwater impacts due to the potential presence of COPR or other chromium-related wastes. The current list of properties subject to the ACO is listed below in **Table 2-1**.

The remedial investigation will involve approximately twenty properties located in Hudson County, New Jersey. The locations of the properties are listed below in **Table 2-1**.

Table 2-1 Non-Residential Chromate Chemical Production Waste Sites

ACO Site Number	Site Name/Location
114	70 Carteret Avenue, Jersey City, New Jersey
132	91 Carteret Avenue, Jersey City, New Jersey
133	22 Halladay Street, Jersey City, New Jersey 15 Halladay Street, Jersey City, New Jersey
135	51-99 Pacific Avenue, Jersey City, New Jersey
137	Rudolf Bass, 45 Halladay Street, Jersey City, New Jersey 25 Halladay Street, Jersey City, New Jersey
143	Talarico Auto, 846 Garfield Avenue, Jersey City, New Jersey
207	Various Properties bound by Garfield Avenue, Communipaw Avenue, NJ Transit Light Rail Line, Woodward Street, and Forrest Street
16	45 Linden Avenue East, Jersey City, New Jersey 07305
63	1 Burma Road, Jersey City, New Jersey
65	Right-of-way on Burma Road, Jersey City, New Jersey

204	Conrail Edgewater Branch Johnston Avenue

2.3.1 AECOM's Scope of Work for Environmental Site Investigations

AECOM has been retained by PPG to conduct a remedial investigation to determine if the soil and groundwater on the property and subsequent adjacent properties have been impacted by the activities of the former chromate production facility. AECOM's scope of field work is as follows:

- Oversight of the installation of soil borings, via direct-push and conventional drilling methods;
- Physical characterization and sampling of soil samples from soil boring activities;
- Soil boring installation may also include the oversight of non-mechanical excavation for utility clearance via soft dig (vactron/air knife) of at least the upper five (5) feet at selected soil boring locations;
- Collection of environmental samples from soil, groundwater, air, surface water, waste, concrete and other matrices;
- Conduct an air monitoring program for particulates, volatile organic compounds ("VOCs") and other potential contaminants during all investigation activities.
- Oversight of environmental test pits and environmental trenching which includes excavation, stock piling and backfilling material.
- Conduct in-situ pilot tests and oversight of joint pilot tests conducted by other contracted consultants.
- Oversight and direction of subcontractor installation and abandonment of temporary and permanent wells for monitoring, extraction, or injection and development of installed wells;
- Gauging, purging and sampling of groundwater monitoring wells;
- Geophysical and hydrologic testing of wells;
- Management of Investigative Derived Waste ("IDW");
- Oversight and direction of surveying services;
- Physical interior and exterior property inspection by AECOM where AECOM is accompanied by the resident, property owner, or an authorized representative for the purposes of identifying visual evidence of Chromate Chemical Production Waste ("CCPW") or other environmental impacts across the site, on the exterior of any structures as well as the interior of ground floor and basement or crawl space, if present.
- Oversight of the installation of IRMs and continued quarterly inspection and maintenance of all installed IRMs.
- Oversight of environmental site investigation work conducted by an outside consultant for PPG.

Soil borings will be drilled for the purpose of collecting soil samples for field screening, geologic logging, and laboratory analysis, and to facilitate well construction. Borings may be drilled using direct push, hollow stem auger, tripod, or air-, mud- or water-rotary methods depending on the material to be penetrated, the target depth, and well installation or other factors.

Air monitoring will be conducted for VOCs, particulates, CO and other applicable contaminants during all subsurface and indoor investigations. Air monitoring will be conducted in the work zone and at the exclusion zone perimeter and will follow Section 8.0 guidelines in this HASP.

Temporary wells may be installed in borings to allow collection of "grab" groundwater samples for laboratory analysis.

Permanent monitoring wells will be installed in certain borings. The monitoring wells are typically constructed using two-inch diameter polyvinyl chloride ("PVC") screen and riser. A sand pack is placed around the screen, followed by a bentonite seal. A cement/bentonite grout is placed from the top of the seal to the ground surface. Bedrock wells may be constructed with a four to six inch diameter open hole rather than a screen. Outer steel casings will be grouted in place.

Groundwater samples will be collected from the newly installed and/or existing permanent wells, typically using low-flow sampling techniques, as described in the NJDEP Field Sampling Procedures Manual ("FSPM"). Prior to sampling, the depth to water will be measured using an interface or depth to water meter.

Test pits and trench excavations may be required during the remedial investigation. Excavation activities will be conducted by an environmental contractor and AECOM will conduct air monitoring, soil sampling and health and safety oversight.

Site walks and inspections will be conducted prior to a site investigation, during a due diligence investigation or during an IRM inspection. An AECOM employee will be accompanied by the site owner and/or the site tenant, and will conduct the site walk/inspection while being aware of current on-site operations and hazards. Site walks and inspections can include the collection of samples from sumps, concrete or other potentially contaminated surfaces to determine the necessity of an IRM. An IRM may be installed by creating a temporary barrier between the contaminated surface and the rest of the property to prevent exposure. An IRM can consist of wood paneling or an epoxy material applied to the contaminated surface or it can include the removal and replacement of the contaminated surface (IE concrete flooring) via controlled demolition or excavation activities.

Most of the remedial investigation activities are successive and will not typically occur concurrently.

2.3.1.1 Project Duration and Shifts Work

Field work typically takes place Monday through Friday from 0700 hour to 1700 hours, but may last until 1900 hours. Work on Saturday maybe required. Work will not generally take place after dark or on weekends or major holidays. AECOM proposes to staff the project with five to eight people.

2.3.1.2 AECOM Contractors

As required by AECOM policy and procedures, subcontractors to AECOM are pre-qualified based on their prior experience with AECOM, total OSHA injury and illness rate, as provided on their OSHA 300A Form for the past three years, experience modification rate (EMR of less than 1) and their corporate safety program. A copy of their corporate safety program is technically reviewed by the RSHEM Manager. Subcontractors to AECOM are also required to submit JSAs/THA and a project HASP for acceptance by AECOM.

Subcontractors are required to provide a safe and healthful working environment for employees that are free from recognized hazards that are causing or likely to cause harm to their employees and other project personnel.

Contractors who AECOM has retained for this project and their area of expertise are as follows:

Contractor	Expertise/Scope of Work
SGS Environmental Services	Advance soil borings, and install and develop groundwater monitoring wells, using a direct push drill rig (Geoprobe®) or other drilling method
Borbas Surveying and Mapping	Survey wells
Jersey City Police Department	Provide off-duty police officers for off-site protection and traffic control

Contractor	Expertise/Scope of Work
TPI Environmental, Inc.	Utility clearance for drilling locations and advance soil borings using a direct push drill rig (Geoprobe®) method as needed

2.4 Scope of Work for Residential Site Investigations

In June 2009, PPG entered into a Judicial Consent Order (“JCO”), which requires the investigation and if necessary, the remediation of chromate chemical production waste (“CCPW”) at residential properties within the vicinity of the PPG Sites. On behalf of PPG, AECOM has prepared a Residential Site Investigation Work Plan (“RSIWP”), which outlines the proposed general scope of work to conduct Residential Site Investigation (“RSI”) activities at residential properties located in Hudson County, New Jersey. A summary of the scope of work is presented below.

- Physical interior and exterior property inspection by AECOM accompanied with the resident/owner looking for visual evidence of CCPW impacts on the exterior of any structures as well as the ground floor and basement or crawl space, if present.
- Surface or subsurface soil sampling may be conducted at residential sites per the RSIWP based on the site inspection findings and/or at the request of the property owner. Surface soil samples are described as samples collected in the first 24 inches of soil below ground surface (“bgs”) (Section 5.3 of the NJDEP FSPM). This may include samples collected directly under asphalt or concrete cover at the surface. Subsurface samples are described as soil samples collected from below the first 24 inches of soil encountered in the soil column. A utility clearance will be performed for any subsurface samples that are collected via the installation of borings by drilling or test pit excavation.
- If evidence of CCPW (e.g., chromium “bloom”, suspected CCPW in contact with masonry) is observed during the site inspection, exterior walls and foundations will be sampled. Foundations are typically constructed of masonry units such as concrete, concrete block, or brick. Walls are typically constructed of brick or concrete masonry units, but could also be constructed of wood and covered with vinyl or metal siding.
- Chip sampling may be used to obtain surface samples from porous masonry. Chip samples are obtained by striking a decontaminated chisel with a hammer against a masonry structure, or using an electric chipping hammer, thereby producing masonry chips for sample collection.
- Concrete core sampling may be utilized to obtain samples from masonry walls, foundations or floors at the surface or at depth.
- If interior evidence of CCPW (e.g., chromium “bloom”, suspected CCPW in contact with masonry) is observed during the site inspection and/or at the request of the property owner, interior masonry walls and/or floors of the lowest level in the structure will be sampled, including basements and crawl spaces where accessible. Basements walls are typically constructed of masonry units such as concrete, concrete block, or brick and may or may not be covered with wood, plaster, or sheetrock walls.

2.4.1 Project Duration and Shifts Work

The start date of this project was January 21, 2010. Field work will typically take place by appointment Monday through Saturday between 0800 hours and 1700 hours by discretion of the property owner. AECOM proposes to staff the project with two to four people.

2.5 Scope of Work for Operations and Maintenance Activities

On behalf of PPG, AECOM is conducting biannual or quarterly ground water monitoring and site maintenance activities on select Hudson County Chrome sites that have already undergone Remedial Action activities. These activities include:

- Conducting a synoptic gauging round on existing wells on the properties;
- Conducting biannual or quarterly groundwater sampling events using low-flow sampling techniques;
- Inspecting existing wells on the properties and maintaining their functionality;
- Inspecting existing Remedial Action structures and maintaining their functionality;
- Oversight of additional remedial or construction activities conducted by other consultants in the vicinity of existing Remedial Action structures

The site included in operation and maintenance activities are located:

ACO Site Number	Site Name/Location
112A	3 Linden Avenue East, Jersey City, New Jersey
146	Commerce Street, Bayonne, New Jersey
147	2 Port Imperial Boulevard, Weehawken, New Jersey

2.5.1 Project Duration and Shift Work

The operation and maintenance activities have been implemented upon completion of the Remedial Action activities and will continue for the duration of the NJDEP groundwater monitoring requirements. Field work will typically take place Monday through Friday between 0800 hours and 1700 hours. AECOM proposes to staff the project with two to four people.

3.0 Organization/Responsibility

3.1 Key Personnel

Scott Mikaelian	Program Manager
Gregg Micalizio	Program Operations Manager (Acting H&S Lead)
Al LoPilato	Project Manager (Non-Garfield Ave Sites)
Chris Martell	Project Manager (Garfield Ave Group of Sites)
Bob Cataldo	Remedial Investigation Lead
Bill Spronz	Remedial Investigation Lead
Craig MacPhee	Engineering Lead
Rich Simun	Residential Site Inspection Program Lead
Rich Feinberg	Field Operations Manager - Garfield Ave Group of Sites
Christine Basinski	Field Operations Manager- Carteret South Properties
Mark Hayden	Construction Manager -Carteret South Properties
Ed Bradshaw	Site 114 Construction Manager
Ron Kantor	SSO/Site 114 Asst. Construction Manager
Brian McGuire	PPG Project Contact
Phil Platcow	Northeast Regional Health and Safety Manager
Michael Grasso	District Health and Safety Manager

An organizational chart showing the hierarchy of the Hudson County Chrome project management is provided in **Appendix I**.

3.2 Staff H&S Responsibilities

3.2.1 Program Manager

The Program Manager (“PgM”) is responsible for the overall implementation and success of the H&S program, for setting H&S policies, goals, and directives; and to conduct periodic management site visits to audit the effectiveness of the H&S program plan and its implementation.

3.2.2 Program Operations Manager (to be replaced by Program H&S Manager)

The Program Operations Manager (“POM”) is the Program Manager’s delegate and is responsible to manage and direct the implementation of the H&S program and set policy and procedures to achieve program goals. The POM or authorized delegate will conduct biweekly H&S management meetings to track program H&S issues and improvements in program policies, procedures, and goals.

3.2.3 Project Managers

The AECOM PMs are the individual who has the primary responsibility for ensuring the overall health and safety of staff conducting work related to this project. The specific safety responsibilities for the PM are listed in Section 4.1.2 of S3NA-209-PR Project Hazard Assessment and Planning (http://my.aecomnet.com/deployedfiles/Intranet/Geographies/Americas/Functions/Safety/2012%20SOP/200%20Series/S3NA_209_PR_Hazard_Assessment_and_Project_Planning.pdf). The PM will provide the Field Operation Managers with work plans, staff, and budgetary resources, which are appropriate to meet the safety needs of the project operations. As such, the PM is responsible for ensuring that the requirements of this HASP are implemented. Some of the PM's specific responsibilities include:

- Allocate the resources necessary for the successful implementation of all necessary safety procedures;
- Provide AECOM subcontractor(s) with a copy of this HASP;
- Document that AECOM subcontractor(s) have provided their own site-specific SH&E documentation or provided a written statement of adoption of the provisions in AECOM's project SH&E documentation.
- Communicate health and safety expectations to field staff and subcontractors;
- Select subcontractors with consideration to their safety and health performance metrics;
- Support the H&S decisions made by the field team;
- Maintaining regular communications with the field team and, if necessary, the RSHEM;
- Update the site-specific HASP to reflect changes in site conditions or the scope of work. HASP updates must be reviewed and approved by the Safety Professional; and
- Conducting random project audits (Management Site Visits).

3.2.4 Technical Leads (e.g. investigation, engineering)

In many instances, PMs will delegate all or a portion of their H&S responsibilities to Technical Leads ("TLs"), who have the overall responsibility to plan and execute field activities. The Technical leads will generally assign staff responsibility to execute planned work according to workplans or other directives. In addition to delegated responsibilities, the TLs will ensure that field team leaders complete and submit JHAs as appropriate to the SSO and that the SSO approves the JHAs prior to initiating field activities. The TLs will also conduct random project audits.

3.2.5 AECOM Field Operation and Construction Managers

Field Operations Managers ("FOMs") and Construction Managers ("CMs") have the responsibility and authority to direct work operations at the job site according to the provided work plans and as necessary to maintain a safe workplace.

The FOM and CM are responsible to:

- Assist the SSO with the implementation of this HASP and ensuring compliance;
- Maintain awareness of activities being conducted, staff responsible, and any special H&S considerations related to that work;
- Discuss deviations from the work plan with the SSO and PM;

- Discuss safety issues with the PM, SSO, and field personnel;
- Assist the SSO and field team with the development and implementation of corrective actions for site safety deficiencies; and
- Assist the SSO with inspections of the site for compliance with this HASP and applicable SOPs.

3.2.6 AECOM Site Safety Officers

All AECOM field technicians are responsible for implementing the safety requirements specified in this HASP. However, one field technician will serve as the SSO. The SSO will be appointed by the FOM and/or the PM. The Field Team Leader ("FTL") serves as the SSO for projects where a dedicated SSO is not assigned. The SSO will be on-site during all activities covered by this HASP. The SSO is responsible for enforcing the requirements of this HASP once work begins. The SSO has the authority to immediately correct all situations where noncompliance with this HASP is noted and to immediately stop work in cases where an immediate danger is perceived.

Some of the SSO's specific responsibilities include:

- Documenting that all AECOM personnel to whom this HASP applies have reviewed this HASP, and submitted a completed copy of the HASP review and acceptance form (**Appendix A**);
- Assuring that all personnel to whom this HASP applies have attended a pre-entry briefing and any subsequent safety meetings that are conducted during the implementation of the program;
- Be aware of changes in AECOM Safety Policy;
- Monitor the lost time incidence rate, incident rate, and other H&S statistics for this project and work with the FOM and POM to develop strategies for improving H&S performance;
- Inspect the site for compliance with this HASP and the SOPs using the appropriate audit inspection checklist provided by an AECOM Safety Professional or using the checklist provided in [S3NA-212-PR](#);
- Work with the FOM, CM, TM/PM, and POM to develop and implement corrective action plans to correct deficiencies discovered during site inspections. Deficiencies will be discussed with project management to determine appropriate corrective action(s);
- Provide a means for employees to communicate safety issues to management in a discreet manner (i.e., suggestion box, etc.);
- Procuring the air monitoring instrumentation required and performing air monitoring for investigative activities;
- Procuring and distributing the PPE and safety equipment needed for this project for AECOM employees;
- Verifying that PPE and health and safety equipment used by AECOM is in good working order;
- Verifying that AECOM subcontractors have a written HASP, workers are trained in accordance with the requirements of this HASP and that subcontractors are prepared with the PPE and other safety equipment required for this project;
- Preparing an initial THA with the FTL during the initial mobilization and revising the THA if conditions or tasks change and communicating with all workers the results of the THA;
- Notifying the FOM or CM of all noncompliance situations and stopping work in the event that an immediate danger situation is perceived;

- In coordination with the FOM and CM, the SSO will determine emergency evacuation routes for each work site and post local emergency telephone numbers as appropriate;
- Ensure that all site personnel and visitors have received the proper training and medical clearance prior to conducting field work;
- Establish any necessary controlled work areas (as designated in this HASP or other safety documentation) or delegate this responsibility to a FTL;
- Conducting accident/incident investigations and preparing accident/incident investigation reports;
- Review and approval of THAs prior to field team initiating work and incorporate THA issues into the pre-entry and tailgate meetings, Conducting the pre-entry briefing prior to beginning work and subsequent tailgate safety meetings and maintain attendance logs and records;
- Discuss potential health and safety hazards with the CM, FOM, TL/PM, and the POM as necessary and appropriate.
- Initiating emergency response procedures in accordance with **Section 13.0** of this HASP; and selecting an alternate SSO by name and inform him/her of their duties, in the event that the SSO must leave or is absent from the site. The alternate SSO must be approved by the FOM and PM.

3.2.7 AECOM District Safety, Health & Environment Manager

The AECOM DSHEM (Mike Grasso) is the individual responsible for the preparation, interpretation and modification of this HASP. Modifications to this HASP which might result in less stringent precautions cannot be undertaken by the PM or the SSO without the approval of the DSHEM. Specific duties of the DSHEM include:

- Writing, approving and amending the HASP for this project;
- Reviewing for acceptance subcontractors HASP and THAs for the project;
- Advising the PM and field team on matters relating to health and safety on this site;
- Recommending appropriate PPE and respiratory equipment to protect personnel from potential site hazards;
- Facilitating Incident investigations;
- Maintaining regular contact with the PM, SSO, and field team to evaluate site conditions and new information which might require modifications to the HASP; and
- Conducting random project audits.

3.2.8 AECOM Field Personnel

All AECOM field personnel covered by this HASP are responsible for following the health and safety procedures specified in this HASP and for performing their work in a safe and responsible manner.

Some of the specific responsibilities of the field personnel associated with this project are discussed below.

Responsibilities of employees associated with this project include:

- Understanding and abiding by AECOM policies and procedures as well as those specified in the HASP;

- Communication of H&S concerns, verifying issues that may be unclear and providing feedback to management relating to possible omissions or suggested modifications in the HASP or other safety policies;
- Notifying the SSO verbally and in writing (if necessary) of unsafe conditions and acts;
- Prepare H&S observation forms as necessary and appropriate and communicate them to the project team and H&S management; and,
- As part of their oversight duties, AECOM personnel shall be responsible for observing site personnel for at-risk behavior and work areas for unsafe conditions. At-risk-behavior of individuals or unsafe conditions shall be promptly reported to the contractor's supervisory personnel who is in charge of the activity or personnel. The at-risk-behavior or unsafe condition and action taken by the responsible party shall be documented.

The health and safety authority of each employee assigned to the site includes the following:

- The right to refuse to work and/or stop work authority when the employee feels that the work is unsafe (including subcontractors or team contractors), or where specified safety precautions are not adequate or fully understood;
- The right to refuse to work on any site or operation where the safety procedures specified in this HASP or other safety policies are not being followed; and,
- The right to contact the SSO, CM, POM, TL/PM and/or the RHSM at any time to discuss potential concerns.

3.2.9 AECOM Subcontractors

The requirements for subcontractor selection and subcontractor safety responsibilities are outlined in [S3NA-213-PR Subcontractors](#). Each AECOM subcontractor is responsible for assigning specific work tasks to their employees. Each subcontractor's management will provide qualified employees and allocate sufficient time, materials, and equipment to safely complete assigned tasks. In particular, each subcontractor is responsible for equipping its personnel with any required PPE and all required training.

AECOM considers each subcontractor to be an expert in all aspects of the work operations for which they are tasked to provide, and each subcontractor is responsible for compliance with the regulatory requirements that pertain to those services. Each subcontractor is expected to perform its operations in accordance with its own unique safety policies and procedures, in order to ensure that hazards associated with the performance of the work activities are properly controlled. Copies of any required safety documentation for a subcontractor's work activities will be provided to AECOM for review prior to the start of onsite activities, if required.

Hazards not listed in this HASP but known to any subcontractor, or known to be associated with a subcontractor's services, must be identified and addressed to the AECOM CM or the FOM prior to beginning work operations. The AECOM personnel are to halt any subcontractor operations, and to remove any subcontractor or subcontractor employee from the site for failure to comply with established health and safety procedures or for operating in an unsafe manner.

Some of the specific responsibilities of the subcontractors are as follows

- Provide AECOM with a copy of the contractor's site specific HASP and THA/JSAs;
- Provide AECOM with documentation that employees have the safety and health training and qualifications as specified in this document ;

- Attending the required pre-entry briefing prior to beginning on-site work and any subsequent safety meetings that are conducted during the implementation of the program;
- Conduct daily toolbox safety talks with their crew or participate/collaborate with AECOM pre-entry and daily safety meetings;
- Ensuring that their equipment is in good working order via daily inspections;
- Perform daily safety inspections of the work area;
- Operating their equipment in a safe manner;
- Appointing a competent person to interface with the AECOM FTL and/or SSO;
- Providing AECOM with copies of MSDS for all hazardous materials brought on-site; and,
- Reporting all incidents that result in injury and/or loss of equipment or damage to property immediately to AECOM after providing or obtaining appropriate medical and emergency assistance.

AECOM subcontractor(s) are required to provide their own site-specific SH&E documentation or provide a written statement of adoption of the provisions in AECOM's project SH&E documentation. Note that if the AECOM project SH&E documentation does not cover the scope required for the subcontractor's activities, the subcontractor cannot adopt AECOM's HASP and must provide their own site-specific SH&E documentation.

3.2.10 Visitors

Authorized visitors (e.g., client representatives, regulators, AECOM management staff, etc.) requiring entry to any work location on the site will be briefed by the CM or the SSO on the hazards present at that location. Visitors will be escorted at all times at the work location and will be responsible for compliance with their employer's health and safety policies. In addition, this HASP specifies the minimum acceptable qualifications, training and PPE which are required for entry to any controlled work area; visitors must comply with these requirements. Unauthorized visitors, and visitors not meeting the specified qualifications, will not be permitted within established controlled work areas.

4.0 Chemical Hazard Assessment and Control

4.1 Chemical Contaminants of Concern

The predominant contaminants of concern associated with the Hudson County Chromium sites are hexavalent chromium and trivalent chromium. Semi-Volatile Organic Compounds ("SVOCs"), including Polycyclic Aromatic Hydrocarbons ("PAHs"), Volatile Organic Compounds ("VOCs"), Polychlorinated Biphenyls (PCBs), pesticides, and other metals may be present at program sites at concentrations exceeding direct contact standards.

4.1.1 Metals

Target Analyte List ("TAL") metals consist of twenty-three metals:

silver ("Ag"),	chromium ("Cr"),	nickel ("Ni"),
aluminum ("Al"),	copper ("Cu"),	lead ("Pb"),
arsenic ("As"),	iron ("Fe"),	antimony ("Sb"),
barium ("Ba"),	mercury ("Hg"),	selenium ("Se"),
beryllium ("Be"),	potassium ("K"),	thallium ("Tl"),
cadmium ("Cd"),	magnesium ("Mg"),	vanadium ("V"),
calcium ("Ca"),	manganese ("Mn"),	zinc ("Zn").
cobalt ("Co"),	sodium ("Na"),	

Selected information is presented below:

Antimony is a silvery-white metal that is found in the earth's crust. Antimony ores are mined and then mixed with other metals to form antimony alloys or combined with oxygen to form antimony oxide. Antimony is found naturally in the environment. The general population is exposed to low levels of it every day, primarily in food, drinking water, and air. Workers in industries that process it or use antimony ore may be exposed to higher levels.

Exposure to antimony at high levels can result in a variety of adverse health effects. Inhaling high levels for a long time can irritate eyes and lungs and can cause heart and lung problems, stomach pain, diarrhea, vomiting, and stomach ulcers. Antimony can irritate the skin if it is left on it.

Ingesting large doses of antimony can cause vomiting. Other effects that may be caused by ingesting antimony are not known. Long-term animal studies have reported liver damage and changes in blood chemistry when animals ingested antimony.

OSHA has set an occupational exposure limit of 0.5 milligrams of antimony per cubic meter of air (0.5 mg/m³) for an 8-hour workday, 40-hour workweek. The American Conference of Industrial Hygienists ("ACGIH") and National Institute for Occupational Safety and Health ("NIOSH") currently recommend the same guidelines for the workplace as OSHA.

Arsenic is a naturally occurring element widely distributed in the earth's crust. In the environment, arsenic is combined with oxygen, chlorine, and sulfur to form inorganic arsenic compounds. Arsenic in animals and plants combines with carbon and hydrogen to form organic arsenic compounds. Inorganic

arsenic compounds are mainly used to preserve wood. Organic arsenic compounds are used as pesticides, primarily on cotton plants.

Inhaling high levels of inorganic arsenic can produce a sore throat or irritated lungs. Ingesting high levels of inorganic arsenic can result in death. Lower levels of arsenic can cause nausea and vomiting, decreased production of red and white blood cells, abnormal heart rhythm, damage to blood vessels, and a sensation of "pins and needles" in hands and feet. Ingesting or breathing low levels of inorganic arsenic for a long time can cause a darkening of the skin and the appearance of small "corns" or "warts" on the palms, soles, and torso. Organic arsenic compounds are less toxic than inorganic arsenic compounds. Exposure to high levels of some organic arsenic compounds may cause similar effects as inorganic arsenic. Skin contact with inorganic arsenic may cause redness and swelling.

OSHA has set a limit of 10 micrograms arsenic per cubic meter of workplace air (10 micrograms per cubic meter or $\mu\text{g}/\text{m}^3$) for 8 hour shifts and 40 hour work weeks.

Beryllium is a hard, grayish metal. In nature, beryllium can be found as compounds in mineral rocks, coal, soil, and volcanic dust. Beryllium compounds are commercially mined, and purified for use in electrical parts, machine parts, ceramics, aircraft parts, nuclear weapons, and mirrors. Beryllium compounds have no particular smell.

The inhalation of beryllium-containing dusts is harmful. The health effects depend on the amount and length of exposure. High levels of beryllium in air can cause lung damage and a disease that resembles pneumonia. Some people become hypersensitive to beryllium. These individuals develop an inflammatory reaction to low levels of beryllium. This condition is called chronic beryllium disease, and can occur long after exposure to small amounts of beryllium. Symptoms of the disease are feeling weak and tired, and difficulty in breathing. Both the short-term, pneumonia-like disease and the chronic beryllium disease can cause death.

Swallowing beryllium has not been reported to cause effects in humans because very little beryllium can be transported from the stomach and intestines into the bloodstream. Beryllium contact with scraped or cut skin can cause rashes or ulcers.

The Department of Health and Human Services ("DHHS") has determined that beryllium and certain beryllium compounds may reasonably be anticipated to be carcinogens. This determination is based on animal studies and studies in workers. None of the studies provide conclusive evidence, but when taken as a whole, they indicate that long-term exposure to beryllium in the air results in an increase in lung cancer.

OSHA sets a limit of 2 micrograms of beryllium per cubic meter of workroom air ($2 \mu\text{g}/\text{m}^3$) for an 8-hour work shift.

Cadmium is a natural element in the earth's crust. It is usually found as a mineral combined with other elements such as oxygen (cadmium oxide), chlorine (cadmium chloride), or sulfur (cadmium sulfate, cadmium sulfide). All soils and rocks, including coal and mineral fertilizers, contain some cadmium. Most cadmium used in the United States is extracted during the production of other metals like zinc, lead, and copper. Cadmium does not corrode easily and has many uses, including batteries, pigments, metal coatings, and plastics.

Inhaling high levels of cadmium can severely damage the lungs and can cause death. Eating food or drinking water with very high levels can severely irritate the stomach, leading to vomiting and

diarrhea. Long-term exposure to lower levels of cadmium in air, food, or water leads to a buildup of cadmium in the kidneys and possible kidney disease. Other long-term effects are lung damage and fragile bones. It is unknown if humans develop any of these diseases from ingesting (eating or drinking) cadmium. There are no known health effects from dermal contact with cadmium in humans or animals.

OSHA limits workplace air to 100 micrograms cadmium per cubic meter ($100 \mu\text{g}/\text{m}^3$) as cadmium fumes and $200 \mu\text{g}/\text{m}^3$ as cadmium dust.

Chromium is a naturally occurring element found in rocks, animals, plants, and soil. Chromium is present in the environment in several different forms. The most common forms are chromium (0), trivalent (or chromium (III)), and hexavalent (or chromium (VI)). Chromium (III) occurs naturally in the environment and is an essential nutrient required by the human body to promote the action of insulin in body tissues so that sugar, protein, and fat can be used by the body.

Chromium (VI) and chromium (0) are generally produced by industrial processes. No known taste or odor is associated with chromium compounds. The metal chromium, which is the chromium (0) form, is a steel-gray solid with a high melting point. It is used mainly for making steel and other alloys. The naturally occurring mineral chromite in the chromium(III) form is used as brick lining for high-temperature industrial furnaces, for making metals and alloys (mixtures of metals), and chemical compounds. Chromium compounds, mostly in chromium (III) or chromium (VI) forms, produced by the chemical industry are used for chrome plating, the manufacture of dyes and pigments, leather tanning, and wood preserving. Smaller amounts are used in drilling mud, rust and corrosion inhibitors, textiles, and toner for copying machines.

The health effects resulting from exposure to chromium (III) and chromium (VI) are fairly well described in the scientific literature. In general, chromium (VI) is more toxic than chromium (III). Breathing in high levels ($>2 \mu\text{g}/\text{m}^3$) of chromium (VI), such as in a compound known as chromic acid or chromium (VI) trioxide, can cause irritation to the nose, such as runny nose, sneezing, itching, nosebleeds, ulcers, and holes in the nasal septum. These effects have primarily occurred in factory workers who make or use chromium (VI) for several months to many years. The OSHA Permissible Exposure Limit ("PEL") for hexavalent chromium is 5 micrograms per meter cubed (" $\mu\text{g}/\text{m}^3$ ") as an 8-hour, time-weighted average ("TWA₈").

Lead is a potent, systemic poison that serves no known useful function once absorbed by the human body. When taken in large enough doses, lead can lead to death in a matter of days. A condition affecting the brain called acute encephalopathy may arise which develops quickly to seizures, coma, and death from respiratory arrest. A short-term dose of lead can lead to acute encephalopathy. Short-term occupational exposures of this magnitude are highly unusual, but not impossible. However, similar forms of encephalopathy may arise from extended, chronic exposure to lower doses of lead. There is no sharp dividing line between rapidly developing acute effects of lead, and chronic effects, which take longer to acquire. Lead adversely affects numerous body systems, and causes forms of health impairment and disease which arise after periods of exposure as short as days or as long as several years.

Chronic overexposure to lead may result in severe damage to the body's ability to form blood, resulting in nervous, urinary and reproductive system problems. Some common symptoms of chronic overexposure include loss of appetite, metallic taste in the mouth, anxiety, constipation, nausea, pallor, excessive tiredness, weakness, insomnia, headache, nervous irritability, muscle and joint pain or soreness, fine tremors, numbness, dizziness, hyperactivity and colic. Lead colic can

cause severe abdominal pain. Chronic overexposure to lead impairs the reproductive systems of both men and women. Overexposure to lead may result in decreased sex drive, impotence and sterility in men. Lead can alter the structure of sperm cells raising the risk of birth defects. There is evidence of miscarriage and stillbirth in women whose husbands were exposed to lead or who were exposed to lead themselves. Lead exposure also may result in decreased fertility, and abnormal menstrual cycles in women. The course of pregnancy may be adversely affected by exposure to lead since lead crosses the placental barrier and poses risks to developing fetuses. Children born of parents, either one or both of whom were exposed to excess lead levels, are more likely to have birth defects, mental retardation, behavioral disorders or die during the first year of childhood. Overexposure to lead also disrupts the blood-forming system resulting in decreased hemoglobin (the substance in the blood that carries oxygen to the cells) and ultimately anemia. Anemia is characterized by weakness, pallor and fatigability as a result of decreased oxygen carrying capacity in the blood.

The PEL set by the standard is 50 micrograms of lead per cubic meter of air (50 ug/ m^3), averaged over an 8-hour workday. In addition to the PEL OSHA has established an action level for lead. The action level is 30 micrograms of lead per cubic meter of air (30 ug/ m^3), averaged over an 8-hour workday. The action level triggers several ancillary provisions of the OSHA standard (29 CFR 1926.62) such as exposure monitoring, medical surveillance, and training.

Mercury is a naturally occurring metal, which has several forms. Metallic mercury is a shiny, silver-white, odorless liquid. If heated, it is a colorless, odorless gas. Mercury combines with other elements, such as chlorine, sulfur, or oxygen, to form inorganic mercury compounds or "salts," which are usually white powders or crystals. Mercury also combines with carbon to make organic mercury compounds. The most common one, methyl mercury, is produced mainly by microscopic organisms in the water and soil. More mercury in the environment can increase the amounts of methyl mercury that these small organisms make.

Metallic mercury is used to produce chlorine gas and caustic soda, and is also used in thermometers, dental fillings, and batteries. Mercury salts are sometimes used in skin lightening creams and as antiseptic creams and ointments.

The nervous system is very sensitive to all forms of mercury. Methyl mercury and metallic mercury vapors are more harmful than other forms, because more mercury in these forms reaches the brain. Exposure to high levels of metallic, inorganic, or organic mercury can permanently damage the brain, kidneys, and developing fetus. Effects on brain functioning may result in irritability, shyness, tremors, changes in vision or hearing, and memory problems. Short-term exposure to high levels of metallic mercury vapors may cause effects including lung damage, nausea, vomiting, diarrhea, increases in blood pressure or heart rate, skin rashes, and eye irritation.

OSHA has set limits of 0.1 milligram of organic mercury per cubic meter of workplace air (0.1 mg/ m^3) and 0.05 mg/ m^3 of metallic mercury vapor for 8-hour shifts and 40-hour work weeks.

Inorganic mercury wastes, generated from coal-burning power plants, may be deposited in a water body where anaerobic bacteria in the detritus of the floor convert the inorganic mercury into methyl mercury. Because of this, methyl mercury has become concentrated in the natural food webs, poisoning fish and shellfish. As such, the primary route of exposure to methyl mercury is via the oral route due to ingestion of contaminated foods.

Methyl mercury produces a much more devastating human illness than elemental mercury, affecting primarily the central nervous system, including the brain, with many disturbances including paralysis, constriction of the visual fields or tunnel vision and blindness. Severe poisoning may produce irreversible brain damage resulting in loss of higher functions. Methyl mercury is also extremely dangerous to the developing fetus. Children exposed to methyl mercury *in utero* are born with severe developmental effects including impaired motor and mental function, hearing loss and blindness.

From an occupational standpoint, the primary concern is direct dermal contact with methyl mercury since it can be directly absorbed through the skin and causes the same systemic effects described above. The OSHA PEL for organic mercury is 0.01 mg/m³.

Nickel is a very abundant natural element. Pure nickel is a hard, silvery-white metal. Nickel can be combined with other metals, such as iron, copper, chromium, and zinc, to form alloys. These alloys are used to make coins, jewelry, and items such as valves and heat exchangers. Most nickel is used to make stainless steel.

The most common harmful health effect of nickel in humans is an allergic reaction. Approximately 10 to 15% of the population is sensitive to nickel. People can become sensitive to nickel when jewelry or other things containing it are in direct contact with the skin. Once a person is sensitized to nickel, further contact with the metal will produce a reaction. The most common reaction is a skin rash at the site of contact. The skin rash may also occur at a site away from the site of contact. Less frequently, some people who are sensitive to nickel have asthma attacks following exposure to nickel. Some sensitized people react when they eat nickel in food or water or breathe dust containing it.

Workers employed in nickel refineries or nickel-processing plants inhale greater levels of nickel than found in the environment. As a result, these same workers have experienced chronic bronchitis and reduced lung function. Workers who ingested water containing high amounts of nickel had stomach aches and suffered adverse effects to their blood and kidneys. Cancers of the lung and nasal sinus have resulted when workers inhaled dust containing high levels of nickel compounds while working in nickel refineries or nickel processing plants.

To protect workers, OSHA has set a limit of 1 milligram of nickel per cubic meter of air (1 mg/m³) for metallic nickel and nickel compounds in workplace air during an 8-hour workday, 40-hour work week.

Thallium is a bluish-white metal that is found in trace amounts in the earth's crust. In the past, thallium was obtained as a by-product from smelting other metals. In its pure form, thallium is odorless and tasteless. It can also be found in combination with other elements such as bromine, chlorine, fluorine, and iodine. When combined with these other elements, thallium can appear colorless-to-white or yellow.

Exposure to high levels of thallium can result in harmful health effects. A study on workers exposed on the job over several years reported nervous system effects, such as numbness of fingers and toes, from inhaling thallium. Human studies reported vomiting, diarrhea, temporary hair loss, and effects on the nervous system, lungs, heart, liver, and kidneys for those who ingested large amounts of thallium over a short time have. Thallium-related deaths have occurred. The effects from ingesting low levels of thallium over a long time are not known. There is no information available on the health effects of skin contact with thallium in people or animals.

OSHA has set an exposure limit of 0.1 milligrams per cubic meter (0.1 mg/m³) for thallium in workplace air. The ACGIH has established the same guidelines as OSHA for the workplace

Vanadium is a compound that occurs in nature as a white-to-gray metal, and is often found as crystals. Pure vanadium has no smell. It usually combines with other elements such as oxygen, sodium, sulfur, or chloride. Vanadium and vanadium compounds can be found in the earth's crust and in rocks, some iron ores, and crude petroleum deposits. Vanadium is commonly combined with other metals to make special metal mixtures called alloys. Vanadium in the form of vanadium oxide is combined in special kinds of steel that is used for automobile parts, springs, and ball bearings. Most of the vanadium used in the United States is used to make steel. Vanadium oxide is a yellow-orange powder, dark-gray flakes, or yellow crystals. Vanadium is also mixed with iron to make important parts for aircraft engines. Small amounts of vanadium are used in making rubber, plastics, ceramics, and other chemicals.

Exposure to high levels of vanadium can cause harmful health effects. Inhaling high levels of vanadium may affect the lungs, throat, and eyes. Workers who inhaled vanadium for short and long durations showed one or more of the following symptoms: lung irritation, coughing, wheezing, chest pain, runny nose, and/or sore throat. These symptoms stopped soon after they stopped inhaling the vanadium contaminated air. Similar effects have been observed in animal studies. No other significant health effects of vanadium have been found in humans.

OSHA has set an exposure limit of 0.05 milligrams per cubic meter (0.05 mg/m³) for vanadium pentoxide dust and 0.1 mg/m³ for vanadium pentoxide fumes in workplace air for an 8-hour workday, 40-hour workweek.

Zinc is one of the most common elements in the earth's crust. It is found in air, soil, and water, and is present in all foods. Pure zinc is a bluish-white shiny metal. Zinc has many commercial uses as coatings to prevent rust, in dry cell batteries, and mixed with other metals to make alloys like brass, and bronze. A zinc and copper alloy is used to make pennies in the United States.

Zinc combines with other elements to form zinc compounds. Common zinc compounds found at hazardous waste sites include zinc chloride, zinc oxide, zinc sulfate, and zinc sulfide. Zinc compounds are widely used in industry to make paint, rubber, dyes, wood preservatives, and ointments. Zinc is an essential element in our diet. Too little zinc can cause health problems; however, too much zinc is also harmful.

Harmful effects generally begin at levels 10-15 times higher than the amount needed for good health. Large doses taken by mouth even for a short time can cause stomach cramps, nausea, and vomiting. If taken for an extended period, it can cause anemia and decrease levels of good cholesterol in humans. Inhaling large amounts of zinc (as dusts or fumes) can cause a specific short-term disease called metal fume fever. The long-term effects of inhaling high levels of zinc are not known. Placing low levels of certain zinc compounds on the skin of rabbits, guinea pigs, and mice caused skin irritation. It is likely that dermal contact on humans would also produce skin irritation.

To protect workers, OSHA has set an average limit of 1 mg/m³ for zinc chloride fumes and 5 mg/m³ for zinc oxide (dusts and fumes) in workplace air during an 8-hour workday, 40-hour workweek.

4.1.2 Miscellaneous Inorganics

Cyanide is usually found joined with other chemicals to form compounds. Examples of simple cyanide compounds are hydrogen cyanide, sodium cyanide and potassium cyanide. Certain bacteria, fungi, and algae can produce cyanide, and cyanide is found in a number of foods and plants. In certain plant foods, including almonds, millet sprouts, lima beans, soy, spinach, bamboo shoots, and cassava roots (which are a major source of food in tropical countries), cyanides occur

naturally as part of sugars or other naturally-occurring compounds. However, the edible parts of plants that are eaten in the United States, including tapioca which is made from cassava roots, contain relatively low amounts of cyanide.

Hydrogen cyanide is a colorless gas with a faint, bitter, almond-like odor. Sodium cyanide and potassium cyanide are both white solids with a bitter, almond-like odor in damp air. Cyanide and hydrogen cyanide are used in electroplating, metallurgy, organic chemicals production, photographic developing, manufacture of plastics, fumigation of ships, and some mining processes.

Persons are not likely to be exposed to large enough amounts of cyanide in the environment to cause adverse health effects. The severity of the harmful effects following cyanide exposure depends in part on the form of cyanide, such as hydrogen cyanide gas or cyanide salts. Exposure to high levels of cyanide for a short time harms the brain and heart and can even cause coma and death. Workers who inhaled low levels of hydrogen cyanide over a period of years had breathing difficulties, chest pain, vomiting, blood changes, headaches, and enlargement of the thyroid gland.

Some of the first indications of cyanide poisoning are rapid, deep breathing and shortness of breath, followed by convulsions (seizures) and loss of consciousness. These symptoms can occur rapidly, depending on the amount eaten. The health effects of large amounts of cyanide are similar, whether it is injected or inhaled. Cyanide can enter the body through dermal contact; however, the exposure rate is slower than the other means of exposure. Dermal contact with hydrogen cyanide or cyanide salts can irritate the skin and produce sores.

OSHA has set a limit for hydrogen cyanide and most cyanide salts of 10 parts cyanide per 1 million parts of air (10 ppm) in the workplace.

Cyanide wastes at MGP sites exist mostly as stable iron cyanide complexes, such as ferric ferrocyanide, which are associated with oxide box wastes common to coal gas sites. A small percentage (< 5%; Luthy et al. 1994) of the total cyanide-containing waste is in the form of less stable metallo-cyanides and cyanide salts. The release of cyanide to air at MGP sites is theoretically possible, but because such releases would occur from very slow dissociation of iron cyanides followed by rapid volatilization and dissipation, this is unlikely to be an exposure issue. Thus, the reported effects of free cyanide are not applicable. Neither OSHA nor the ACGIH have established exposure limits for ferrocyanide.

4.1.3 Total Volatile Organic Compounds ("TVOCs")

The TVOCs include benzene, toluene, ethylbenzene, and xylenes ("BTEX"). Exposure to the vapors of BTEX above their respective OSHA PELs may produce irritation of the mucous membranes of the upper respiratory tract, nose and mouth. Overexposure may also result in the depression of the central nervous system. Symptoms of such exposure include drowsiness, headache, fatigue and drunken-like behaviors. Prolonged overexposure to benzene vapors has detrimental effects on the blood-forming system ranging from anemia to leukemia.

The PEL for benzene is 1 ppm, as TWA₈. The OSHA PEL for ethylbenzene is 100 ppm. The PEL for toluene is 200 ppm. Xylene is a flammable, colorless liquid with an OSHA PEL of 100 ppm as an 8-hour TWA. Inhaling xylene vapors above the PEL may result in motor activity changes, irritability and drunken-like behaviors. Xylene vapors are also irritating to the eye.

4.1.4 Semi Volatile Compounds

PAHs are a subgroup of SVOCs that may be formed during the incomplete burning of coal, oil and gas, garbage, or other organic substances like tobacco or charbroiled meat.

Some PAHs are manufactured. These pure PAHs usually exist as colorless, white, or pale, yellow-green solids. PAHs are found in coal tar, crude oil, creosote, asphalt sealcoat, and roofing tar, but a few are used in medicines or to make dyes, plastics, and pesticides. Some properties of PAHs are listed below:

- PAHs can occur in air attached to dust/soot particles.
- PAHs may enter soil and groundwater through discharges from industrial facilities.
- Most PAHs do not dissolve readily in water. They adsorb to solid particles and may settle to the bottoms of lakes or rivers.
- Microorganisms can break down PAHs in soil or groundwater; however, this is a slow process, and most PAHs are considered to be persistent in the environment.
- In soils, PAHs are most likely to adsorb to particles, although certain PAHs move through soil to contaminate groundwater.
- The concentration of PAHs in plants and animals may be much higher than concentration of PAHs in the soil or water in which they live.

OSHA has set a limit of 0.2 milligrams of PAHs per cubic meter of air (0.2 mg/m³) including anthracene, benzo(a)pyrene, phenanthrene, chrysene and pyrene.

Naphthalene is a byproduct of coal gasification associated with MGP wastes. Naphthalene is a black, viscous liquid or semi-solid with a strong odor (mothball) and sharp, burning taste.

Exposure to large amounts of naphthalene may damage or destroy some red blood cells. This could cause a reduced level of red blood cells until the body replaces the destroyed cells. This condition is called hemolytic anemia. Some symptoms of hemolytic anemia are fatigue, lack of appetite, restlessness, and pale skin. Exposure to large amounts of naphthalene may also cause nausea, vomiting, diarrhea, blood in the urine, and a yellow color to the skin. Animals sometimes develop cloudiness in their eyes after swallowing high amounts of naphthalene. It is not clear whether this symptom also develops in humans. Rats and mice exposed to naphthalene vapors daily for a lifetime developed irritation and inflammation of their nose and lungs. The International Agency for Research on Cancer (IARC) concluded that naphthalene is possibly carcinogenic to humans.

OSHA set a limit of 10 ppm for the level of naphthalene in workplace air during an 8-hour workday, 40-hour workweek.

Benzo(a)pyrene, a coal tar pitch volatile, is a polynuclear aromatic hydrocarbon which forms yellowish crystals melting at 179°C. Synonyms are 3,4-Benz(a)pyrene or B[a]P. Benzo(a)pyrene is a polycyclic aromatic hydrocarbon (PAH) that has no commercial-scale production.

Benzo(a)pyrene is produced in the United States by one chemical company and distributed by several specialty chemical companies in quantities from 100 mg to 5 g for research purposes. Although not manufactured in great quantity, benzo(a)pyrene is a by-product of combustion. It is estimated that 1.8 million pounds per year are released from stationary sources, with 96% coming from coal refuse piles,

outcrops, and abandoned coal mines; residential external combustion of bituminous coal; coke manufacture; and residential external combustion of anthracite coal.

Human exposure to benzo(a)pyrene can occur from its presence as a by-product of chemical production. The number of persons exposed is not known. Persons working at airports in tarring operations, refuse incinerator operations, power plants, and coke manufacturers may be exposed to higher benzo(a)pyrene levels than the general population. Scientists involved in cancer research or in sampling toxic materials may also be occupationally exposed. The general population may be exposed to benzo(a)pyrene from air pollution, cigarette smoke, and food sources. Benzo(a)pyrene has been detected in cigarette smoke at levels ranging from 0.2 to 12.2 ug per 100 cigarettes. Benzo(a)pyrene has been detected at low levels in foods ranging from 0.1 to 50 ppb.

The PEL is 0.2 mg/m^3 and the REL is 0.1 mg/m^3 . ACGIH has designated benzo(a)pyrene as an industrial substance suspect of carcinogenic potential for man, with no TWA value set.

Harmful effects and symptoms of benzo(a)pyrene are potential local and systemic carcinogenic effects. Coal-tar and other materials which are known to be carcinogenic to man may contain benzo(a)pyrene. A 1% solution applied to the skin caused skin irritation, swelling, flaking, coloration of skin, and formation of warts.

Level C, with a combination HEPA, acid gas, and organic vapor cartridge, can be used up to 2 mg/m^3 . Above this value, level B is required. Determination in air is via collection of PTFE filter and XAD-2 adhering to NIOSH Methods 5506 or 5515.

4.1.5 Polychlorinated biphenyl ("PCB")

PCBs are a series of technical mixtures, consisting of many isomers and compounds that vary from mobile oily liquids to white crystalline solids and hard non-crystalline resins. The variability is based upon the degree of chlorination (and location of chlorine atoms) on the diphenyl rings that act as the skeleton for PCBs. The name Aroclor® 1221, 1233, 1242, 1248, 1254, 1260 etc. correspond as to the percentage that the diphenyl rings have been instituted, i.e., 21%, 33%, 42%, etc. The most commonly encountered PCBs are chlorodiphenyl (42% chlorine) [Aroclor® 1242] and chloridiphenyl (54% chlorine) [Aroclor® 1254]. These compounds are light, straw-colored liquids with typical chlorinated aromatic odors; 42% chlorodiphenyl is a mobile liquid and 54% chlorodiphenyl is a viscous liquid. Chlorodiphenyl (42% chlorine) boils between 617° and 691° and freezes at -2°F . Chlorodiphenyl (54% chlorine) boils between 689° and 734°F and freezes at 50°F . The synonyms for PCBs are chlorodiphenyls, Aroclors, and Kanechors. Names further defining PCBs, based upon chlorine substitution are Aroclor® 1221, 1232, 1242, 1248, 1254, 1260, 1262, 1268, 2565, 4465, 5442, 5460 and Kanechlor 300, 400, 500. PCBs are incompatible with strong oxidizers.

PCBs are used alone and in combination with chlorinated naphthalenes. They are stable, thermoplastic, and nonflammable, and find chief use in insulation for electric cables and wires, in the production of electric condensers, as additives for extreme pressure lubricants, and as a coating in foundry use. PCBs are one member of a class of chlorinated aromatic organic compounds which are of increasing concern because of their apparent ubiquitous dispersal, persistence in the environment, and tendency to accumulate in food chains, with possible adverse effects on animals at the top of food webs, including man. The OSHA PEL and ACGIH TLV are 1 mg/m^3 for chlorodiphenyl 42% Cl and 0.5 mg/m^3 for 54% Cl. The NIOSH REL for both 42% and 54% are 0.001 mg/m^3 . The IDLH level is 5 mg/m^3 .

Routes of entry are via inhalation of fume or vapor and percutaneous absorption of liquid, ingestion, eye and skin contact. Harmful effects from short term exposure are as follows:

Inhalation - May produce irritation to nose, throat, and lungs. Levels above 10 mg/m^3 are reported to be unbearable. Inhalation may contribute significantly to all symptoms of long term exposure.

Skin - Absorption is moderate. Contributes significantly to all symptoms of long term exposure. Sensitized individuals may develop a rash after 2 days exposure by contact or inhalation.

Eyes - May produce irritation. Levels of 10 mg/m^3 are severely irritating.

Ingestion - Absorption in the digestive system contributes significantly to all symptoms of long term exposure. There are no reported deaths of humans due to a single ingestion. However, experiments in animals suggest that ingestion of 6 to 10 fluid ounces would cause death to a healthy 150 pound adult.

Long term exposure to PCBs at high levels of 1 to 10 mg/m^3 may produce a burning feeling in the eyes, nose and face; dry throat; lung and throat irritation; nausea, dizziness, chloracne, and the aggravation of existing acne. Liver damage and digestive disturbance have been reported in some individuals. OSHA has identified PCBs as a dermal carcinogen. PCBs may impair the function of the immune system. PCBs at high levels have been shown to produce cancer and birth defects in laboratory animals. Whether PCBs produce these effects in humans is not known.

North and MSA do not approve the use of APRs for protection against 42% and 54% chlorodiphenyl as a Determination in air is via collection on a particulate filter or with a florasil tube, adhering to NIOSH Method 5503 for PCBs' vapor. However, if it is a particulate concern via adhering to soil, level C with HEPA filters can be used.

4.1.6 Pesticides

Pesticides such as Chlordane, DDT, Lindane, and Toxaphene are found as solids incorporated into soil, dissolved in petroleum products, or in very dilute concentrations in ground water. These chemicals are essentially insoluble in water unless significant amounts of other organics are dissolved in the water. Most pesticides are soluble in both chlorinated and petroleum solvents. If contaminated dusts are present use air purifying respirators with HEPA filters and goggles or a full face respirator. DDT can be absorbed into the body by skin contact or ingestion; thoroughly wash exposed skin prior to leaving the work site.

Dieldrin and **Aldrin** are also known as HEOD, Compound 497, and Octalox. Dieldrin is a light tan-to-brown powder. It is used as an insecticide, and is also formed from aldrin in the environment. Exposure may produce dizziness, sweating, jerks of the limbs, and convulsions. It is a neurotoxin. The half-life of dieldrin in humans is reported to be as long as 9 months. Dieldrin may be an animal carcinogen, but cancer has not been proven in humans. The 8-hour PEL for Dieldrin is 0.25 mg/m^3 . Pure Dieldrin is corrosive to skin and eyes, the chemical can cause severe respiratory tract, eye and skin burns. If ingested, Dieldrin may cause severe digestive tract irritation with possible burns. Dieldrin can be absorbed through the skin.

4.1.7 Concrete Dust

During the demolition of concrete foundations construction workers have a potential exposure to crystalline silica. Operations such as dumping of rock, jack hammering, abrasive blasting, sawing, drilling or demolition of concrete and masonry structures are some of the activities that could produce this exposure.

Crystalline silica (quartz) is a common mineral found in the earth's crust and is found in many types of rock including sedimentary, metamorphic or igneous. Silica is present in both work and non-work environments, and exposure to crystalline silica dust has long been known to cause a disease called silicosis. When crystalline silica is inhaled, the lung tissue reacts by developing fibrous tissue around trapped silica particles.

This condition of the lung is called silicosis. Dust containing the crystalline forms of silica particles small enough to enter the deep parts of the lung can cause "silicosis", which is a scarring of the lung tissues, cancer and other forms of lung disease, including an increased risk of getting tuberculosis. The effects of silicosis can be undetected for several years before the problem is known. Elevated exposures can produce health problems sooner. At first, there may be no symptoms of disease, and then shortness of breath, fatigue, severe cough and chest pain can develop later on. Silicosis cannot be reversed and requires a lung transplant in advanced stages. Therefore, minimizing exposure to crystalline silica is the best prevention for silicosis.

Routes of exposure include contact and inhalation. Concrete dust exposure in the eyes may cause immediate or delayed irritation and inflammation. Skin contact with concrete dusts may cause drying of the skin with consequent mild irritation. Inhaling concrete dust may irritate the moist mucous membranes of the nose, throat and upper respiratory system.

4.2 Chemical Exposure and Control

4.2.1 Chemical Exposure Potential

Soils and groundwater at program sites have the potential to be significantly impacted with the contaminants of concern and the potential for exposure to the contaminants is considered to be moderate to high depending on the site location and site task being performed. All employees must be prepared to don protective clothing and respiratory protection should engineering controls be insufficient to reduce dust and/or vapor levels during the implementation of subsurface investigations.

The inhalation of dusts is the primary potential route of exposure during the implementation of IRMs and FS activities by PPG's contractor. The potential for dust generation will be managed through the implementation the Dust Control Plan ("DCP") which is part of the IRMWPs#1 and IRMWPs#2. A robust DCP has been submitted to NJDEP under separate cover that provides information regarding activities with the potential to generate dust during the on-site activities, and the proposed techniques to control same. The use of protective clothing and respiratory protection by AECOM personnel may be necessary if the dust action levels are exceeded and engineering controls are insufficient to reduce the dust levels to below the action limit. If truck traffic is anticipated to occur over unpaved or unvegetated soil areas that would result in loose dirt and visible dust, AECOM will evaluate the need for additional dust control measures. Typical best management practices to control dust may include spraying of water or foam, or the use of plastic over uncovered roadways for access over unpaved and/or unvegetated areas.

The vapor pressures of the volatile organic compounds found in MGP wastes are not high enough to generate a potential vapor hazard during typical IRM activities, such as those planned for this project. However, the inhalation of dusts impacted with VOC compounds will be a potential concern, especially during activities that have a potential to generate dust. The BTEX compounds associated with MGP wastes are volatile enough that the inhalation of vapors may be of concern if coal tars are encountered.

Direct dermal contact with impacted soils is another potential route of exposure during the collection of samples or other intrusive activities.

Although unlikely, exposure to all of the contaminants of concern can occur via ingestion (hand-to-mouth transfer). The decontamination procedures described in **Section 12.0** address personal hygiene issues that will limit the potential for contaminant ingestion.

4.2.2 Chemical Hazard Control

The chemical hazards associated with project activities and sampling activities can be controlled in several ways, including:

- Maintaining a upwind position during intrusive activities that have the potential to generate dust;
- When conducting work in residential areas, conduct interior sampling prior to exterior sampling to minimize potential for tracking soil inside the residence;
- Containing work area with poly-sheeting;
- Limiting the number of personnel in the work area;
- Use of mists or wetting for dust control;
- Use of a HEPA vacuum to control point source dusts;
- Shrouding the chisel when chipping masonry surfaces;
- Use of personal protective equipment; and
- Following decontamination procedures.

Garfield Avenue Group Sites

A Dust Control Plan (“DCP”) will be implemented for all activities that may generate contaminated dust particles. A DCP was submitted to NJDEP under separate cover that provides information regarding remedial activities with the potential to generate dust during remedial activities at the GA group of sites. As discussed in that plan, the use of protective clothing and respiratory protection by AECOM personnel may be necessary if the dust action levels are exceeded and engineering controls are insufficient to reduce the dust levels to below the action limit. Typical best management practices to control dust may include spraying of water or foam, or the use of plastic over uncovered and/or non-vegetated surface areas.

A copy of Dust Control Plan is available to AECOM personnel at the following location:

\\uspsw2vp001\DATA_USPSW2VFP001\Environment\Piscataway\Project\PPG-NJCProgram\7-Deliverables\7.1B-GAGroup\IRMWP-1\Appendices\Appendix C - DCP\2010_06 FINAL Dust Control Plan_FD.pdf

4.2.3 Hazard Communication

In addition, any employee or organization (contractor or subcontractor) intending to bring any hazardous material onto this AECOM-controlled work site must first provide a copy of the item’s MSDS to the SSO for review and filing (the SSO will maintain copies of all MSDS on site, communicate the information to the Project Team and make sure that copies are transferred electronically to the Piscataway file server for the project). MSDS may not be available for locally-obtained products, in which case some alternate form of product hazard documentation will be acceptable in accordance with the requirements of [S3NA-507-PR Hazardous Materials Communication/WHMIS](#).

All personnel shall be briefed on the hazards of any chemical product they use, and shall be aware of and have access to all MSDS.

All containers on site shall be properly labeled to indicate their contents. Labeling on any containers not intended for single-day, individual use shall contain additional information indicating potential health and safety hazards (flammability, reactivity, etc.).

5.0 Biological and Other Hazard Control

During the course of field work employees are at risk of being exposed to poisonous plants, insects, spiders and snakes. The two most prevalent biological hazards are poison ivy and ticks. Additional information on Biological Hazards can be found in [S3NA-313-PR Wildlife, Plants and Insects](#).

5.1 Poison Ivy

Poison ivy is a common cause of a skin irritation called contact dermatitis that may result in a red, itchy rash consisting of small bumps, blisters or swelling. This native perennial grows throughout the Northeast, in woods, fields, and sometimes in the garden. It grows in sun or shade, and in wet or dry places. Its growth habit depends on where it is growing, resulting in a trailing ground cover, free-standing shrub, or a vine supported by trees, shrubbery and fences. All parts of the poison ivy plant contain, urushiol, which causes the allergic reaction. Most poisonings occur during the growing season when the presence of lush foliage increases the chance of contact, but the dormant stems and roots of the vine can cause winter poisoning as well.

The best protection against poison ivy is to avoid contact with the plant (leaves, stems and roots). The best defense against contracting poison ivy is to recognize the plants. The adage "leaves of three, let it be" refers to the groupings of three leaflets connected to a common stem that characterize most of these plants. However, if you cannot avoid poison ivy, follow these precautions to help prevent contact:

- Wear protective clothing such as long-sleeved shirts, long trousers, boots or sturdy shoes with socks and gloves;
- Use a barrier cream such as CoreTex IvyX™ Pre-Contact solution; and
- If heat stress will not be a problem the use of a Tyvek™ coveralls and nitrile gloves is recommended for areas with heavy poison ivy infestation.

If contact with poison ivy has been made or is suspected, follow these guidelines:

- As soon as possible (within 5–10 minutes of contact), wash all exposed skin with strong soap (i.e. Dawn) and water to remove the oil. If this is not possible, rinse thoroughly with water.
- Use a post-contact skin cleanser such as Technu® skin cleanser or CoreTex IvyX™ cleanser towelettes.
- Put on gloves to remove clothes and shoes, and wash clothing in hot water and detergent to remove any plant oil that may be on them.
- Notify your supervisor if contact or suspected contact is made with poison ivy.
- If a severe allergic reaction develops, seek medical attention.

5.2 Ticks

Ticks transmit bacteria that cause illnesses such as Lyme disease or Rocky Mountain spotted fever. Ticks wait for a host from the tips of grasses and shrubs (not from trees). When brushed by a person, they quickly let go of the vegetation and climb onto the host. Ticks can only crawl; they cannot fly or jump. The tick season typically lasts from April through October; peak season is May through July;

seasons can vary depending on climate. Ticks can be active on winter days when the ground temperatures are about 45° Fahrenheit.

The best way to protect oneself against tick borne illness is to avoid tick bites. This includes avoiding known tick-infested areas. However, if wooded areas or areas with tall grass and weeds are visited, the following precautions can be used to help prevent tick bites and decrease the risk of disease:

- Wear protective clothing such as long-sleeved shirts, long trousers, boots or sturdy shoes and a head covering. (Ticks are easier to detect on light-colored clothing).
- Tuck trouser cuffs in socks. Tape the area where pants and socks meet so ticks cannot crawl under clothing.
- Apply insect repellent containing 10 percent to 30 percent N,N-Diethyl-meta-toluamide ("DEET") or 5 percent to 10 percent picaridin primarily to clothes. Apply sparingly to exposed skin. Do not spray directly to the face; spray the repellent onto hands and then apply to face. Avoid sensitive areas like the eyes, mouth and nasal membranes. Be sure to wash treated skin after coming indoors.
- Use repellents containing permethrin to treat clothes (especially pants, socks and shoes) but not skin. Always follow label directions; do not misuse or overuse repellents.
- Those who wish to avoid the use of insect repellent or treated clothing should consider the use of the Original Bug Shirt® and pants, and tick/chigger garters.
- Personnel should carefully inspect themselves each day for the presence of ticks or any rashes. This is important since prompt removal of the tick can prevent disease transmission. Removal of the tick is important in that the tick should not be crushed and care must be taken so that the head is also removed. Contact the RSHEM for guidelines on removing ticks.
- Report tick exposure and bites to your supervisor.

5.3 Wasp and Bees

Wasps (hornets and yellow-jackets) and bees (honeybees and bumblebees) are common insects that may pose a potential hazard to the field team if work is performed during spring, summer or fall. Bees normally build their nests in the soil. However, they use other natural holes such as abandoned rodent nests or tree hollows. Wasps make a football-shaped, paper-like nest either below or above the ground. Yellow-jackets tend to build their nests in the ground but hornets tend to build their nests in trees and shrubbery.

To avoid bees and wasps:

- If you see insects flying to and from a particular place, avoid it.
- If you are going to be in an area where disturbing a nest is likely, wear long pants and a long sleeved shirt. Insect repellent applied to your skin or clothing will not deter these stinging insects.
- Wear light colored clothing.
- Remain as calm as possible if a bee or wasp lands on your skin.

- If you don't want to wait for it to leave, gently and slowly brush it away. It is best not to wear perfume, cologne, or other scented soaps or scented shampoos as this attracts bees and wasps.
- Never swing, strike or run rapidly away since quick movement often provokes attack and painful stings.
- Restrain from throwing rocks or spraying nests with water.
- Avoid creating loud noises and disturbance near the nest.

When a wasp or a bee stings a person, it injects a venomous fluid under the skin. The venom causes a painful swelling that may last for several days. The following should be followed to minimize the reaction of a bee or wasp sting:

- Gently scrape the area of the bite using a blunt object like a fingernail or a credit card to remove the stinger. If removed within 15 seconds of the sting, the severity of the sting is reduced.
- Try not to rub or scratch the sting site after the stinger is removed.
- Wash the sting site with soap and water.
- Apply a cold or ice pack wrapped in cloth for a few minutes.
- If you develop hives, difficulty breathing or swallowing, wheezing or similar symptoms of allergic reaction, SEEK MEDICAL ATTENTION IMMEDIATELY. People with known allergies to insect stings should NEVER work alone.
- A person with a history of severe allergic reaction to an insect sting may be advised by their physician to carry an insect sting allergy kit to counteract the allergic reaction whenever they may encounter stinging insects. Also they should consider wearing a medical ID bracelet and notify others on the field team.

5.4 Sharps

Sharps are defined for the purpose of this HASP as syringes or hypodermic needles used for the injection of legal or illegal drugs. Sharps used by intravenous drug users are capable of spreading disease such as hepatitis, skin abscesses, human immunodeficiency virus ("HIV"), endocarditis (an infection of the heart), and other diseases involving microorganisms.

While these disease are associated with needle sharing among substance abusers, persons who come into contact with sharps/dirty needles maybe at risk of developing one of these diseases, if they are accidentally punctured by a sharp.

Vigilance must be exercised when working in areas where sharp could be present. If you see a sharp leave it alone and warn others. Prior to kneeling on the ground or handling soil samples look before you kneel or handle soil. When handling soil samples it is suggested that Kevlar gloves be used under the sampling gloves. When handling equipment that is stored on the ground, it is suggested that leather work gloves be used to prevent contact with sharps. If contact is made with a sharp immediately notify your supervisor of the incident. In the event of a sharp exposure medical help and consultation with a physician will be made available to the employees.

5.5 Animals

5.5.1 Dogs

Domestic and stray dog may be encountered during field activities. To prevent possible injuries from dogs:

Prevent Contact with Dogs:

- Alert dog to your presence (whistle; honk horn; slam car door)
- Back car in
- Leave car door open
- Get back in car if there is time
- Notify police or Animal Control
- Stay in car if dog is loose or tied or behind a screen door in insecure pen
- Do not enter yard of loose or tied dog or dog in insecure pen

If Contact is Unavoidable:

- Calm the dog (let him sniff the back of your hand, drop treats)
- Stand sideways to the dog
- Stand still
- Stand quietly with head down and avoid eye contact

Defensive Action:

- Try to be still and quiet and wait for help
- Retreat slowly if dog backs off
- Never turn your back
- Don't let fearful dog get behind you
- Drop treats on the ground

If a Dog Attacks:

- Shout "NO" before he gets to you
- Feed him something - jacket; clipboard; dog bumper
- Protect face and neck
- Try to be still and quiet
- Never run away or try to fight off an attacking dog
- Notify the Animal Control

Domestic animals (dogs) will protect their territory no matter how friendly they may appear. For the safety of the domestic animal and your personal safety, the resident should be advised to secure their pets. If a domestic animal is chained outside, avoid approaching the animal or harassing it.

5.5.2 Critters

Critters (skunks, opossums, squirrel, raccoons, etc.) may be encountered especially in urban areas. Avoidance of critters is important to prevent being bitten. Prior to entering abandon buildings, crawlspace, etc., the area should be full illuminated to look for critters. If a critter is spotted and does not leave, Animal Control should be contacted for advice on relocating the critter. Entry into the crawl space should not be made until the critter leaves or is removed.

5.5.3 Rodents

Rodents such as rats and mice may be encountered during site activities. Rodents are nocturnal and avoid human contact. The illumination of an area and the presence of humans should cause rodents to scurry away. Nevertheless, personnel should avoid contact with rodents. If bitten/scratched, get medical attention immediately.

Live rodents can spread diseases (rat-bite fever, tularemia) through their urine and droppings. In addition, dead rodents can spread diseases. AECOM will not enter any rodent infested areas. These areas must be cleared and cleaned by the property owner prior to being accessed by AECOM.

5.6 Weather

5.6.1 Severe Weather

Prior to mobilization the project manager or field team personnel should be cognizant of the long range and short range weather forecast for the region in which they will be working in. If severe weather is forecasted work should be temporarily postponed until the weather is more favorable. Daily, field team members should check the weather forecast for inclement or severe weather. A weather radio or radio set on an AM channel is the best sources for weather information and weather alerts. On the internet the Storm Prediction Center's web page can be check for alerts and warnings.

<http://www.spc.noaa.gov/products/www/>.

All four seasons can bring about severe weather to the region, ranging from extremely cold temperatures to high winds and thunder and lightning storms. Hurricanes have been known to hit the northeast and while rare, tornados do occur in the northeast.

In the event of server weather is forecast the following steps should be taken:

- Temporarily stop work and secure the site.
- Seek shelter in a vehicle or safe indoor location.
- Stop all work and seek a safe area when lightning is within range of the site (by the time you hear thunder, you are ALREADY within lightning range). Safe areas include low areas (NOT subject to flash floods), grounded metal structures or vehicles. Follow the 30/30 rule: If you see lightning and cannot count to 30 before hearing thunder, stay indoors for 30 minutes after hearing the last clap of thunder.
- Shut down generators and electrical equipment in an orderly manner to protect the equipment from electrical surges and abrupt power loss.
- Move all personnel off crawler-type equipment and boom equipment. Lower booms.

When working in low areas, be alert for the potential of flash flooding and plan a route to reach higher ground.

5.6.2 Cold and Heat Stress

AECOMs Heat Stress Prevention Plan can be found in [S3NA-511-PR](#) and Cold Stress Prevention Plan can be found in [S3NA-505-PR](#). Procedures found in these plans must be implemented as necessary to prevent thermal stress.

Heat and cold stress may vary based upon work activities, PPE/clothing selection, geographical locations, and weather conditions. To reduce the potential of developing heat/cold stress, be aware of the signs and symptoms of heat/cold stress and watch fellow employees for signs of heat/cold stress.

Heat stress can be a significant field site hazard, particularly for non-acclimated personnel operating in a hot, humid setting. Site personnel will be instructed in the identification of a heat stress victim, the first-aid treatment procedures for the victim and the prevention of heat stress casualties.

5.6.3 Responding to Heat-Related Illnesses

The guidance below will be used in identifying and treating heat-related illness.

Table 5-1 Identification and Treatment of Heat-Related Illness

Type of Heat-Related Illness	Description	First Aid
Mild Heat Strain	The mildest form of heat-related illness. Victims exhibit irritability, lethargy, and significant sweating. The victim may complain of headache or nausea. This is the initial stage of overheating, and prompt action at this point may prevent more severe heat-related illness from occurring.	<ul style="list-style-type: none"> • Provide the victim with a work break during which he/she may relax, remove any excess protective clothing, and drink cool fluids. • If an air-conditioned spot is available, this is an ideal break location. • Once the victim shows improvement, he/she may resume working; however, the work place should be moderated to prevent recurrence of the symptoms.
Heat Exhaustion	Usually begins with muscular weakness and cramping, dizziness, staggering gait, and nausea. The victim will have pale, clammy moist skin and may perspire profusely. The pulse is weak and fast and the victim may faint unless they lie down. The bowels may move involuntarily.	<ul style="list-style-type: none"> • Immediately remove the victim from the work area to a shady or cool area with good air circulation (<i>avoid drafts or sudden chilling</i>). • Remove all protective outerwear. • Call a physician. • Treat the victim for shock. (<i>Make the victim lie down, raise his or her feet 6–12 inches, and keep him/her cool by loosening all clothing</i>). • If the victim is conscious, it may be helpful to give him/ her sips of water. • Transport victim to a medical facility ASAP.

5.6.4 Responding to Cold-Related Illnesses

The guidance below will be used in identifying and treating cold-related illness.

Table 5-2 Identification and Treatment of Cold-Related Illness

Type of Cold-Related Illness	Description	First Aid
Frostbite	<ul style="list-style-type: none"> Lack of feeling in the affected area; skin that appears waxy, is cold to the touch, or is discolored (flushed, white or gray, yellow or blue). 	<ul style="list-style-type: none"> Move the person to a warm place. Handle the area gently; never rub the affected area. Warm gently by soaking the affected area in warm water (100–105 °F) until it appears red and feels warm. Loosely bandage the area with dry, sterile dressings. If the person's fingers or toes are frostbitten, place dry, sterile gauze between them to keep them separated. Avoid breaking any blisters. Do not allow the affected area to refreeze. Seek professional medical care as soon as possible
<ul style="list-style-type: none"> Hypothermia 	<ul style="list-style-type: none"> Signs and symptoms of hypothermia include— shivering, numbness, glassy stare; apathy, weakness, impaired judgment; loss of consciousness. A person with hypothermia usually isn't aware of his or her condition, 	<ul style="list-style-type: none"> CALL 9-1-1 or the local emergency number. Gently move the person to a warm place. Monitor breathing and circulation. Give rescue breathing and CPR if needed. Remove any wet clothing and dry the person. Warm the person slowly by wrapping in blankets or by putting dry clothing on the person. Hot water bottles and chemical hot packs may be used when first wrapped in a towel or blanket before applying. Do not warm the person too quickly, such as by immersing him or her in warm water. Rapid warming may cause dangerous heart arrhythmias. Warm the core first (trunk, abdomen), not the extremities (hands, feet). This is important to mention because most people will try to warm hands and feet first and that can cause shock.

5.7 Personal Security

Field activities have the potential to take personnel into areas where criminal activities take place or where field personnel can be a crime victim. Vagrants, suspected gang members, and other criminal elements may frequent the project areas. To protect yourself: stay out of the area at night; use the buddy system; let someone in the office know when you arrive on site and when leaving; call in regularly; pay attention to what is going on around you; if it does not look safe to get out of your vehicle lock the doors and drive off quickly. Further, no site worker shall knowingly enter into a situation where there is the potential for physical and violent behaviors to occur. If site workers encounter hostile individuals within the project locations or a confrontation develops in the work area, staff will suspend activities, immediately leave the area of concern, and contact local 911 for assistance.

If field team members feel that their security is threatened by the neighborhood or activities taking place in the vicinity of a property, the field team members should not leave their vehicle, but shall lock the vehicle, drive to safe location and notify the CM or PM and, as appropriate, the police.

At a minimum, police personnel will accompany field team during night work or any environmental investigations performed on sidewalks, in roadways, or in abandoned buildings. Field team members will be equipped with a cell phone in the event of an emergency.

In general, follow the four **As**:

- Be **AWARE** of your surroundings and who or what is nearby.
- **ASSESS** the situation and possible threat.
- **ACT** quickly and decisively. Change your route, go into a store, use your voice, etc.
- Maintain a confident **ATTITUDE**. Don't appear to be an easy target.

Each two-person team must have at least one charged and otherwise functioning cell phone to facilitate emergency communications. Cellular phone operation shall be confirmed at the start, mid-point, and near the end of each working day.

As a personal security precaution AECOM may employ/request the services of a police detail from the South District Station of the Jersey City Police Department. A police detail would serve to deter crime and provide traffic control as necessary.

Safety tips from the National Crime Prevention Council are as follows:

- Stay alert in your surroundings -- make eye contact with everyone.
- Walk purposefully...head up, eyes forward.
- Carry a small amount (\$10.00 or so) of "mugger's money." Sometimes assailants become angry if they do not get anything.
- Limit your contact with strangers on the street.
- Communicate confidence, be in control of the environment and show it.
- Consider your options in the event you are confronted, e.g., scream or blow a whistle to attract attention, flee to a safe area, etc. Decide what you plan to do and practice your responses so you can recall them in a real situation.
- Don't carry a lot of cash or valuables.
- Photocopy contents of your wallet and keep in a safe location for future reference. This will be valuable to report stolen credit cards and other personal items.
- Don't carry a gun, knife, club, chemical spray, or other weapon. Some are illegal to carry and all could be used against you.
- Report suspicious persons or activities to the local precinct. Remember to dial "911" should you require emergency police or medical service.

Although it is always best to be polite, even to strangers, it is a good idea to be very wary of anyone you don't know that approaches you. They may ask for directions, money or anything else. Answer quickly, and continue on your way. If they persist, tell them that you are unable to help and mention that a police officer would be better suited to provide assistance.

If you feel threaten get in your vehicle lock the door and drive away quickly. If it is not possible to drive away, get in your vehicle, lock the doors, and call 911 from the vehicle. It is suggested that you

notify the South District Jersey City Police Department (non-emergency number 201-547-5456) when working in this area as they may send a patrol car by to deter crime.

- South District Jersey City Police Department – 191 Bergen Ave, Jersey City, NJ

A map to the South District Station will be provided to the field team.

5.7.1.1 When Confronted or Threatened by Hostile Individuals

- Be calm and follow instructions exactly. Don't make any sudden moves.
- Don't risk your personal safety. Don't resist and try to be a hero.
- Consider all guns as loaded weapons.

Observe the criminal's features, clothing, behavior, means of escape, etc. without being obvious about it. Being a good witness is critical in helping the police to locate and arrest the criminal.

5.8 Hazardous Waste Management

Wastes generated during the field operations, including investigation-derived wastes ("IDW"), will be handled as detailed in Section 9.0 of the Field Sampling Plan/Quality Assurance Project Plan ("FSP-QAPP"), and in the Work Plans developed for the Sites. Wastes that may be generated include drill cuttings, masonry cuttings, used PPE, decontamination fluids, decontamination water, and general garbage. Solids such as drill cuttings derived from test borings and decontamination solids will be containerized in USDOT approved 55-gallon drums. Drums will be shipped from the site to a licensed facility in accordance with state and US EPA Resource Conservation and Recovery Act ("RCRA") regulations.

At the Garfield Avenue Sites, drums will be staged at Site 114 at temporary waste storage areas pending waste characterization and off-site disposal. The location of the drum storage and waste stockpile areas are subject to change as the remediation of the site progresses. At other sites, a drum storage pad will be constructed at a location designated by the FTL or SSO.

5.9 X-ray Fluorescence ("XRF") Device

An XRF is being used to provide environmental characterization and remediation services in the Garfield Avenue Group of Sites. The XRF unit(s) is registered with the NJDEP Bureau of X-Ray Compliance and an x-ray survey has been completed for the units at Site 114. The XRF is used only by personnel registered in the dosimeter program and trained to use the device. An [XRF Radiation Protection Plan](#) has been developed for the XRF devices onsite.

6.0 Physical Hazards and Controls

6.1 Back Safety

Using the proper techniques to lift and move heavy pieces of equipment is important to reduce the potential for back injury. Manual lifting is address in [S3NA-308-PR](#). The following precautions should be implemented when lifting or moving heavy objects:

- Bend at the knees, not the waist. Let your legs do the lifting;
- Do not twist while lifting;
- Bring the load as close to you as possible before lifting;
- Be sure the path you are taking while carrying a heavy object is free of obstructions and slip, trip and/or fall hazards;
- Use mechanical devices to move objects that are too heavy to be moved manually; and,
- If mechanical devices are not available, ask another person to assist you.

6.2 Confined Space

Crawlspaces may be considered a non-permit confined space in accordance with 29 CFR 1910.146 and AECOM [S3NA-301-PR](#) if the crawlspace does not have known or potential hazards (health and physical). AECOM personnel are not permitted to access confined spaces.

AECOM employees shall not enter a confined space without prior authorization from the RSHEM. AECOMs confined space entry procedures and training requirements are listed in [S3NA-301-PR Confined Spaces](#).

Confined spaces on this project may include but not limited to: pipes, vaults, tanks, manholes, and excavations/trenches or any other space that has limited or restricted means for entry or exit and is not designed for continuous employee occupancy.

Confined space entry shall be performed in such a manner as to protect personnel from the hazards associated with entering a confined space such as lack of oxygen, toxic gases and vapors and physical hazards. AECOM's Contractor/Subcontractors whose personnel shall enter a confined space are responsible for compliance with 29 CFR 1910.146 when working in confined spaces. The SSO is responsible for identifying and labeling potential confined spaces.

Prior to confined space entry by AECOM Contractor/Subcontractors a specific confined space procedure must be develop and approved by the SSO with concurrence by the AECOM RSHEM. All aspects of the permit-required confined space entry program, required by the Confined Space Standard, (29 CFR 1910.146) must be included in the procedure. A summary of confined space requirements are as follows:

- If confined spaces exist on a project, warn workers of danger by posting signs and prevent unauthorized entry.
- Regardless, the atmosphere in the confined space (permit or non-permit) must be monitored prior to initial entry.
- Identify and evaluate the hazards associated with confined space entry including the hazards posed by the work that will take place in the confined space.
- No worker shall enter a confined space that contains less than 19.5% oxygen or more than 23.5% oxygen as indicated with testing equipment. Nor shall workers enter a confined space that is at or above 10% Lower Explosive Limit ("LEL"), or an Immediately Dangerous to Life or Health ("IDLH") atmosphere.
- Specify acceptable entry conditions, (i.e., prescribe PPE to be worn, emergency rescue equipment that must be available, hazard controls to be followed, etc.).
- The following equipment shall be provided to workers and procedures must be in place to ensure that it is used correctly:
 - Testing and monitoring equipment (test before and during entry operations)
 - Ventilating equipment
 - Communications equipment
 - PPE
 - Lighting equipment
 - Barriers and shields
 - Ladders
 - Rescue and emergency equipment
- Develop and implement site-specific procedures for summoning rescue and emergency services. Rescuers must be trained to use PPE, rescue equipment, and perform rescue duties including; first aid, cardiopulmonary resuscitation ("CPR"), and rescue breathing.

The training shall meet the requirement as found in 29 CFR 1910.146 and that the training can be verified by documentary evidence. If confined spaces are identified, the SSO/site supervisor will inform AECOMs Contractors/Subcontractors of the location of confined spaces and prevent unauthorized entry. AECOMs confined space entry procedures and training requirements are listed in S3NA-301-PR Confined Spaces is applicable only to AECOM employees.

6.3 Control of Hazardous Energy

AECOM employees initiating lockout/tagout shall do so by following AECOM procedure [S3NA-410-PR Hazardous Energy Control](#).

Lockout procedures for the control of hazardous energy shall be implemented and enforced. Lockout procedures are required to render inoperative electrical systems, pumps, construction equipment, motors, pipelines, valves and all other such energy systems that may accidentally be energized while employees are working on them on or before they are ready and released for service. Control of hazardous energy shall comply with Subpart J of 29 CFR 1910. The general lockout requirements are as follows:

- Notify affected personnel and facility staff.

- Shut down equipment by normal stopping procedure.
- Isolate from energy sources using blocks, caps or blanks.
- Apply locks with tag identifying the person performing the lockout. Each authorized person working on equipment applies his/her own lock.
- Release any stored energy.
- Verify isolation.
- Remove guards or covers as necessary and perform work.
- When work is complete, reinstall guards and inspect equipment to ensure it is operational.
- Notify affected personnel.
- Remove locks. Each authorized individual removes his/her own.
- Return the equipment to service and notify affected personnel.

6.4 Construction Equipment

AECOM personnel are to remain clear of operating heavy equipment to the extent feasible. Specific requirements for construction equipment can be found in [S3NA-309-PR Mobile or Heavy Equipment](#)

The use of construction equipment on a project such as loaders, excavators, dump trucks compactors pose the potential hazard of employees being struck by the equipment or caught between the equipment and a fixed object such as a wall.

Use of construction equipment (excavators, dump trucks etc) will require all personnel to wear steel-toed boots, hard hat, high visibility garment, and safety eyewear. Personnel shall not remain in the vicinity of construction equipment unless it is required for their work responsibilities. When employees must work near construction equipment, eye contact and clear communication must be maintained. When working around construction equipment, employees must:

- Make sure that the operator/driver is aware of your presence/activities;
- Stay in the operator's line of sight, don't work in his/her blind spot;
- Approach areas where equipment is operating from a direction visible to the operator;
- Be aware of the swing radius of the excavator and sudden movement of equipment;
- Do not walk or work underneath loads handled by digging equipment or expelled by the screen/crusher plant or pug mill;
- Stand away from trucks being loaded or unloaded to avoid being struck by any spillage or falling materials;
- Cell phone, text messaging or the use of personal headsets is prohibited when working near construction equipment;
- Prior to daily use, construction equipment shall be inspected by the operator;
- Exposed moving machinery parts on screen/crusher plant or pug mill that present a hazard shall be guarded; and
- Operating equipment, such as but not limited to, screen/crusher plant and pug mill shall be locked out at the controls whenever the equipment is being worked on or the equipment is out of service.

Additionally, when samples are collected from an excavator bucket the collector must establish a verbal communication and work protocol to ensure that the equipment operator is aware of their presence, the bucket is lowered to the ground while samples are collected, and during sample collection the equipment operator will remove their hands from the controls; it is preferred that the equipment be completely turned off and de-energized while sample collection occurs. The operator will not re-engage the equipment until the sample collector has left the area.

6.5 Drilling

AECOM employees are not authorized to operate any type of mobile drill rig, and shall stay out of the path of travel of a drill rig and away from rotating and moving parts of a drill rig when it is operating. AECOM employees must maintain a distance of at least 15 feet from the drilling operations. Specific requirements for drilling and boring can be found in [S3NA-405-PR Drilling and Boring](#).

The hazards associated with drill rigs are caught by or between moving or rotating parts, struck by the movement of the drill rig or material being handled, contact with above ground and below ground utilities, and slips trips and falls on slippery surfaces, hose lines, and drilling material.

Prior to drilling it is important and the law that underground utilities be identified by calling 811 to have buried utilities identified and located. It is also important to identify aboveground utilities, such as electrical lines, cable television or telephone wires that may be in the vicinity of the proposed bore hole or path of travel of the drill rig. The minimum safe clearance distance from above ground utilities such as electrical wires is 15 feet.

- Except for the driller and helper, all personnel will stay away (e.g., 15+ ft) from the rig when it is operating;
- If required to approach the drill rig for the collection of samples or down hole observations the drill rig must be taken out of gear to stop movement of boring tools. Only then can you approach the rig;
- Loose fitting clothing must be secured when in the vicinity of drilling operations;
- The drill rig operator shall perform a visual safety of the drill rig daily and after it has been moved to a new location;
- As necessary hearing protection shall be used when near drilling operations; and
- Personnel should avoid walk through drilling mud, crossing over hoses and other drilling material.

6.6 Demolition

Demolition activities involve the use of construction equipment in which employees maybe struck by. In addition employees working near demolition activities can be exposed to dust, struck by debris and trip fall over debris. During demolition activities AECOM personnel must:

- Not enter any structure undergoing demolition unless accompanied by the demolition contractor's competent person;
- Do not enter areas containing asbestos or where asbestos abatement is being performed;
- Walk or work behind or alongside a building being demolished;
- Maintain an upwind position least a distance of 4x the building height away from structures being demolished; and

- Do not walk on debris piles.

The demolition contractor shall comply with Demolition Standard as found in, 1926 Subpart T (1926.850-1926.860), address hazards associated with demolition.

Prior to any demolition operation, construction documents must be filed with the local code official showing the design and construction of any temporary vehicle passageways, pedestrian protection, fencing and/or similar devices that contractor may utilize/require.

Prior to the start of the demolition operations, an engineering survey of the structure shall be made by a qualified or competent person to determine the type and condition of the building's walls and floors so that action can be taken, if needed, to prevent premature collapse of any portion of the structure/building. This may include bracing and shoring of walls, floors and/or adjacent buildings. Consideration should also be given to potential soil retention systems.

All utilities shall be shut-off, capped or controlled at or beside the building line. "Dig Safe" or "utility locator" service must be contacted. In each case, the responsible utility company shall be notified in advance, and its approval or services be obtained.

Entrances to the building being demolished should be protected by an overhead structure providing protection at a minimum of 8 feet out from the front of the building and capable of sustaining a load of 150-lb/sq ft (pounds per square foot).

Stairs, passageways and ladders must be designated as a means of access to the building or structure. All other access ways shall be entirely closed off at all times. Provide illumination, natural or artificial.

Where a hazard may exist from fragmentation of glass, all glazed openings should be removed or protected

During demolition, inspections by the Contractors competent persons shall be made as the work progresses to detect hazards resulting from weakened or deteriorated floors, walls or loosened materials. No worker shall be permitted to work where such hazards exist until they are corrected by shoring, bracing or other means.

The control (continuous wet down) of dust being generated by the demolition operations and/or on-site crushing operations must be provided for.

Only those employees necessary, for the performance of those operations, shall be permitted when demolition operations are being performed.

In the operation of cranes or derricks, a standard signal system shall be used. All personnel assigned to such operation shall be fully instructed in and knowledgeable of these signals and will be required to use and observe them. All employees shall be kept clear of any loads that are about to be lifted and of suspended loads.

Before any demolition work is begun, every thoroughfare adjacent to the work shall be closed, relocated or protected. Travel ways that must be used by the public and emergency response teams shall be kept clear and unobstructed at all times.

An inspection should be made an appropriate amount of time (1 hour) following the daily completion of burning operations to check for possible fires. Hot work procedure/permit must be followed.

Fire suppression equipment shall remain activated or an impairment notice filled with the local fire department. Provisions shall be made by the contractor to implement a fire prevention plan and to provide suitable fire extinguishers.

6.6.1 Concrete Demolition

Demolition of existing building foundations or other concrete structure will either be broken into manageable pieces by the use of an excavator or the use of a pneumatic point attached to the arm of an excavator. Personnel shall stay out of the area where concrete is being demolished to avoid being struck by flying concrete pieces or concrete that is being handled which may contain sharp edges or have rebar sticking out. If concrete is to be cut using a concrete or masonry saw, only wet methods will be used to minimize concrete dust generation and extend the life of the saw blade. AECOM personnel should avoid being in the immediate vicinity where concrete cutting is taken place and should observe such operations from an upwind location.

6.7 Driving Safety

Drivers must be licensed to drive the class of vehicle they are operating and trained in defensive driving. Only AECOM personnel may drive AECOM vehicles or vehicles rented for AECOM business; client, subcontractor, or other work-related personnel may ride. Drivers and passengers must comply with all traffic laws and posted signs, and will not operate a vehicle if under the influence of impairing medication, alcohol, or any other substance. Specific requirements for driving safety can be found in [S3NA-005-PR Vehicle and Driver Safety Program](#).

Make sure that the following basic safe driving practices are followed at all times while working on this project:

- Always wear a seat belt while operating a motor vehicle or while traveling as a passenger.
- Obey speed limits and local traffic laws at all times.
- Obtain proper directions to the site in advance and take the route that is most likely to be free of known traffic hazards (e.g., congestion, construction, etc.) and that avoids travel through potentially dangerous neighborhoods.
- Abstain from distractions while driving (e.g., the use of cell phones, texting, eating/drinking, reading maps, etc.) If necessary, stop the vehicle and pull over to perform such activities safely. ***The project policy is engine on, cell phone off.*** It is strongly suggested that AECOM employees do NOT operate a vehicle while talking on their cell phone, regardless of “hands free” or not. If the employee needs to make a call, they should pull over to answer it. Do NOT allow other distractions to interfere with the safe operation of the vehicle.
- Do not operate a motor vehicle if you are tired and/or have not had sufficient rest. Additional information on vehicle safety can be found in [S3NA-005-PR Driver and Vehicle Safety Program](#).

6.7.1 Garfield Avenue Group Driving Safety

Due to the large-scale construction and remediation activities on Site 114 and Carteret South, the on Site traffic will be managed by PPG's construction contractor through the implementation of the [Traffic Safety Control Plan](#) (“TSCP”) which was developed by AECOM to safely control the traffic throughout the program. The TSCP details truck routes, waiting areas, and other aspects of the transportation of impacted soil as a part of IRM activities. Access to Site 114 will be via the gate on Carteret Avenue.

Site truck routes will be maintained, as needed, to provide easy access to the project area and to reduce tracking of soil out of the excavation area. AECOM is also contractually required to only allow project staff with clean driving records to operate vehicles on site.

The potential for traffic generated dust will be managed through the implementation the [DCP](#) and an [Air Monitoring Plan](#) ("AMP"), which are part of the IRM activities. A robust AMP and DCP have been submitted to NJDEP under separate cover that provides information regarding activities with the potential to generate dust during the on-site activities, and the proposed techniques to control same.

6.8 Excavation Hazards

AECOM employees will be working in proximity to excavations required for the removal of impacted soils. In addition, personnel shall maintain at least 3 foot distance from the edge of the excavation that is not protected by a guardrail system, fence or other barriers. Additional information on excavation and trenching can be found in [S3NA-303-PR Excavation and Trenching](#).

The principle hazards associated with excavation and trench activities are striking buried utilities, struck by material being handled and engulfment from soil caving in. In addition, excavations and trenches constructed in a hazardous area such as near a gasoline station, landfill or hazardous waste site maybe classified as permit required confined space do to potential that the atmosphere may contain hazardous gases or vapors, or be oxygen deficient.

It the responsibility of the excavation contractor retained by PPG or AECOM to ensure that a competent person conducts a dally inspection of the excavation and that excavations are properly constructed and site personnel are prevented from falling into an excavation or trench.

In accordance with OSHA regulations, a competent person must conduct daily inspection of each trench or excavation, the adjacent hazards and protective systems for evidence of possible cave-in/failure of protective systems, hazardous atmosphere, and other hazardous condition and determine the necessary precautions to take.

AECOM employees should not enter an excavation or trench if they feel that entry is unsafe or does not meet the requirements presented below:

- Prior to digging, the appropriate digging permit must be obtained. All underground utilities in the work area must be positively identified by calling 811. Markings made during the utility investigation must be maintained throughout the course of work.
- When personnel are required to enter a trench or excavation over 4 feet deep, an adequate means of exit, such as a ladder, steps, or ramp must provided and located so as to require no more than 25 feet of lateral travel. Ladders will extend at least 3 feet above the edge of the trench and will be securely staked in place.
- Walkways or bridges with standard railings and toe board must be provided when personnel or equipment are required to cross over excavations.
- The walls and faces of excavations in which personnel are exposed to danger from moving ground must be guarded by a shoring system, sloping of the ground, or some other equivalent means as required by 29 CFR 1926 Subpart P.
- No person shall be permitted under loads handled by excavators or other material handling equipment.
- The spoils pile shall be placed at one side of the excavation. At a minimum, the toe of the spoil pile shall be at least 2 feet away from the edge of the excavation. The spoils pile shall be

moved farther back in proportion to the depth of the excavation. The spoils pile height shall not exceed the depth of the excavation and shall be sloped to prevent the soil and rocks from sliding into the excavation.

- Protective system(s) to prevent cave-in shall be used when personnel enter excavations 5 feet or greater in depth or if the competent person determines it is necessary at shallower depths. Protective system(s) shall be compliant with the requirements of 29 CFR 1926 Subpart P. A Registered Professional Engineer must design protective systems for excavations/trenches 20 feet or greater in depth.
- Where protective systems are used such as trench boxes, hydraulic shoring, etc., they shall be used in accordance with the manufacturer's specifications and limitations. The manufacturer's tabulated data for such systems must be maintained on the project.
- Employees should never enter an excavation that show signs of a cave-in, has water seeping into it, or contains free standing water.
- Excavation or trenches that pose an atmospheric hazard must be tested for oxygen content, explosive gases/vapors and toxic gases/vapors (i.e. carbon monoxide, hydrogen sulfide, contaminants of concern) prior to and during entry.

6.9 Electrical Hazards

AECOM employees are not authorized to work on electrical equipment or near any part of an electrical circuit unless they are protected against shock by guarding or by de-energizing and grounding the circuit. Information on general electrical safety can be found in [S3NA-302-PR Electrical, General](#) and information on hazard energy control (lockout) is found in [S3NA-410-PR Hazardous Energy Control](#).

All temporary and permanent electrical work, installation, testing and maintenance and all electrical equipment and appliances shall conform to the requirements of the National Electrical Code and comply with the requirements of 29 CFR 1926 Subpart K.

Potential electrical hazards include electric shock, electrocution, burns, fires, and explosion. Electrical cords used to carry electrical power pose a trip and fall hazards. The use of portable generator poses an electrical hazard and also the hazard associated with exposure to carbon monoxide.

To prevent potential electrical incidents the following basic electrical practices must be followed at all times while working on this project.

- Only qualified electricians with full knowledge of the electrical code requirements will be allowed to perform electrical work.
- The use ground-fault circuit interrupters ("GFCIs") are required on this project. Additionally, inspection and testing shall be conducted to locate defective electrical equipment, tools, and cords, which may expose personnel to electrical hazards. An assured grounding program shall not be used on this project.
- Temporary electrical cords must be rated for extra hard usage or hard usage and must be of the three-wire type with a grounding pin and a grounding receptacle. Look for the following letters on the cord: S, SJ, ST, or SO markings on the cord.
- Temporary electrical cords must be protected or elevated a minimum of 8 feet. They must be kept clear of walkways and other location where they may be exposed to damage or create a trip hazard. Do not hang extension cords with bare wire, nails, staples or objects that will cut/damage cords.

- Inspect all electrical cords for signs of wear and exposed wiring, strain, and ripped, torn, cut or burned insulation. Defective cords shall be removed from service.
- Electrical tools and equipment must be grounded, of the double insulated or cordless type battery operated.
- All 120-volt, 15- and 20-amp receptacles must be protected by a GFCI. Follow manufacturers' recommended testing procedure to insure GFCI is working correctly.
- Temporary lighting shall have guards that protect the entire bulb surface. Broken and burned-out lamps shall be replaced immediately.
- If needed, before cutting or drilling into walls, ceilings and floors it must be ascertain by inquiry or direct observation, or by instruments, whether any energized electrical power circuit or pressurized lines are concealed. Where such circuits or lines are identified workers shall be notified of their location and protective measures to be taken.
- Check the work area for overhead and underground electrical utilities. Employees must be protected from overhead hazards by meeting the guidelines listed below.
 - If the overhead power line is 50 kilovolts ("kV") or less, then stay at least 10 feet away. For everything else, keep at least 35 feet away. Contact the power company if power lines needed to be, moved, de-energized and grounded, or have insulated sleeves installed.
- In potentially hazardous environments, electrical equipment must meet the National Electrical Code ("NEC") classification for hazardous locations. Consult the RSHEM for the proper type of equipment
- When work is to be performed on electrical equipment, lockout procedures are required to ensure that the equipment is de-energized and isolated.
- Energized wiring in junction boxes, circuit breaker panels and similar places shall be covered at all times. The covers must be secured.
- Fuel generators before use and re-fuel only after the engine has been shut down and allowed to cool.
- Never use a portal generator indoors. Locate a generator so that the exhaust is downwind from your position or locations where carbon monoxide can enter (e.g. confined spaces, indoor locations etc.).

6.10 Falls

6.10.1 Same Level

Falls from slips and trips are common workplace occurrences that can result in serious injuries and disabilities. The most common types of falls: is falls at the same level. Fall hazards of exist in most workplaces including offices, manufacturing and construction. Slips and trips can be prevented by following these guidelines:

- Personnel shall be vigilant in providing clear footing, clearly identifying obstructions, holes, stick ups, or other tripping hazards and maintaining an awareness of uneven terrain and slippery surfaces.
- Walking and working surfaces shall be kept free of materials, obstructions, and substances that could cause a surface to become slick or otherwise hazardous.
- Makeshift substitute ladders such as toolboxes, buckets, and coolers shall not be used.

- The use of cellular telephones (testing, making or receiving calls) for personal use is prohibited in the work area.
- Walk around, not over or on, debris or equipment that might have been stored in the work area.
- Do not jump from platforms or truck beds.
- When carrying equipment, identify a path that is clear of any obstructions. It might be necessary to remove obstacles to create a smooth, unobstructed access point to the work areas on site.

During the winter months, snow shovels and salt crystals or calcium chloride should be kept on site to keep work areas free of accumulated snow and ice. Furthermore, use sand or other aggregate material to help keep work surfaces from being slippery, especially where salt/calcium chloride cannot be used. In addition, make sure work boots have soles that provide good traction. When walking on ice is necessary crampons or Yaktrax® should be used.

6.10.2 Elevated Surfaces

Falls from elevation greater than 6 feet above a lower level or less than 6 feet above dangerous equipment can result in serious injury and even death. To prevent falls from elevations the walking and working surface must be surrounded on all open sides by standard railings or their equivalent (fence, barricade or cover), or by employees who are protected by a personal fall arrest system. Information on elevated platforms and fall protection can be found in [S3NA-304-PR Fall Protection](#).

To use a personal fall arrest system employees must be trained in their use, limitations and care of the system. A personal fall arrest system consists of the following:

- Anchor point capable of supporting 5000 pounds;
- Full body harness meeting ANSI requirements;
- Shock absorbing lanyard meeting ANSI requirements that limit free fall distance to six feet; or
- Self-retracting lanyard that meets ANSI requirements for limiting the free fall distance to two feet.

It is the responsibility of the Contractor/Subcontractor who created the fall hazards to provide a standard railing or equivalent around openings greater than 6 feet above a lower level or less than 6-feet above dangerous equipment. In addition, excavation 6 feet or more in depth not readily seen must have a standard railing or equivalent around openings. Employee at the edge of a well, pit, shaft, and similar excavation 6 feet or more in depth must be protected from falling by standard railing or equivalent.

Falls from elevations can be prevented by following these guidelines:

- Where an employee observes that a fall hazard exists in the workplace that is not protected by a standard rail the employee shall promptly notify the responsible party. AECOM employees must avoid the area until the responsible party has taken the necessary corrective actions;
- Stay away (at least 15 feet) from unprotected opening;
- Do not lean on or climb on a standard railing or equivalent;
- Avoid walking on floor hole covers and do not remove floor hole covers; and
- Where a standard railing is not provided or when removed employee must use a personal fall arrest system.

6.10.3 Stairways

Stairways in residential structures pose a potential fall hazard due to lack of maintenances, steps used for storage and poor lighting. Personnel should ask the residence if the stairways are safe to step on, if not an alternative route should be found. It is suggested that the resident should lead the way. Information on working in stairways safely can be found in [S3NA-312-PR Stairways and Ladders](#). Precautions that should be taken to prevent falling down stairways include:

- Illuminate the area;
- Visually inspect stairways for clutter missing steps etc;
- Sound questionable steps with a broom stick or tool handle before stepping;
- Step to the side of the steps where supports are;
- Use handrails; and,
- Use a backpack to keep hands free.

6.11 Hand Tools

Hazards associated with hand tools are cuts, lacerations, electrocution, and struck by flying objects. Frequent and prolonged use of hand tools can cause soreness, aches, pains, and fatigue, which, when ignored, can lead to chronic musculoskeletal injuries ("MSIs"). Additional information on hand tool safety can be found in [S3NA-305-PR Hand and Power Tools](#).

Many injuries have been caused by the use of fixed open blade knives such as a jack knife or box cutter. Cutting tools that can be used by AECOM employees for cutting include shears, snips, tubing cutters, ratchet type pipe cutters, side cutters, and retractable blade utility knife or concealed blade knife. The use of fixed opened blade knives is prohibited.

Basic safety rules can help prevent hazards associated with the use of hand tools:

- Use the right tool for particular work activity being conducted (e.g., don't use a file or a screwdriver as a pry bar).
- Examine each tool for damage before use (e.g., worn, splintered handles, etc.) and do not use damaged tools.
- Use properly the right PPE (e.g. eye protection, gloves, hearing protectors).
- Hold work in a clamp or vise, not in your hand.
- Position your body securely while working with the tool.
- Plastic covered tool handles are for comfort only, not protection from electrical current.
- Claw hammers are for driving and removing finishing and common, unhardened nails. Don't strike other steel tools such as chisels, punches or masonry nails with a claw hammer.
- When working with a wrench, always pull the wrench, never push the wrench.
- Hand sockets should never be used on power or impact wrenches. Hand sockets usually have bright finish but may have black finish.

- Discard any chisel or punch that is chipped or mushroomed.
- Don't use a screwdriver for prying, punching, chiseling, scoring or scraping. Screwdrivers should only be used to drive or remove screws.
- Never use an extension bar such as a length of pipe to increase leverage on a wrench. This could result in breakage of the wrench and personal injury.
- Ball peen hammers of appropriate size or hand drilling hammers should be used to strike chisels, punches and star drills. Do not use the claw hammer.
- Select a wrench whose opening exactly fits the nut. Too large an opening can spread the jaws of a wrench. Too large a box- or socket wrench can mar or turn the corners of the nut. Exercise care in selecting inch wrenches for inch fasteners and metric wrenches for metric fasteners.
- Only spark-resistant tools made from brass, plastic, aluminum, or wood to should be used around flammable substances.
- For continuous work, use comfort grips or gloves, take frequent breaks, avoiding awkward positions, and consider using a power tool.

6.12 Illumination

Basements and crawl spaces of residential structures may not be adequately illuminated to prevent spill trips and falls or allow for visual acuity for this reason the use of flashlights and portable work lights will be necessary.

Field personal should have available for use a battery-powered flashlight/lantern to illuminate the walking surface and work area. In entering a crawl space a hand free head lamp should be used.

Portable work lights shall be guarded to prevent the breakage of the lens and bulb. Broken and burned-out lamps shall be replaced immediately. The electrical cord for the light must contain a ground prong and be plugged into an outlet containing a GFCI. Portable lights generate heat and should be located away from combustible or flammable material. Personnel must be careful to avoid handling the work light when it is hot. Allow the light to cool down before handling.

6.13 Noise Exposure

The use of construction equipment can expose the field team to noise levels that exceed the 85 dB for an 8-hour day. Exposure to noise can result in the following:

- Temporary hearing losses where normal hearing returns after a rest period;
- Interference with speech communication and the perception of auditory signals;
- Interference with the performance of complicated tasks; and,
- Permanent hearing loss due to repeated exposure resulting in nerve destruction in the hearing organ.

Since personal noise monitoring will not be conducted during the proposed activities, employees must follow this general rule of thumb: If the noise levels are such that you must shout at someone two (2) feet away from you, you need to be wearing hearing protection. Employees can wear either disposable earplugs or earmuffs but all hearing protection must have a minimum noise reduction rating ("NRR") of 27 decibels ("dB").

AECOM has a Hearing Conservation Program which can be found in [S3NA-510-PR Hearing Conservation Program](#).

6.14 Traffic Control

During certain work tasks, the establishment of traffic control to adequately protect workers and the public may be required on-site. Site specific requirements will be determined by the Contractor on a case-by-case basis. Only approved traffic control devices per accordance with the Manual of Uniform Traffic Control Devices ("MUTCD") will be used on public road ways per accordance with the applicable State regulatory guidance.

During on-site GA Group, IRM and FS remedial activities, traffic on Site 114 will be managed by PPG's construction contractor through the implementation of the [TSCP](#), which details truck routes, waiting areas, and other aspects of the transportation of impacted soil as a part of IRM activities. An on-site speed limit of 5 miles per hour will be maintained on Site. Access to the Site will be via the gate on Carteret Avenue. The TSCP for the Garfield Avenue Group sites is a working document and will be amended as work progresses to the south of Carteret Avenue (on Site 132, 133, 135, 137 and 143).

General traffic control precautions include placing a work vehicle between your worksite and oncoming traffic whenever possible. Not only is it a large, visible warning sign, but also if an oncoming car should fail to yield or deviate, the parked vehicle rather than your body would absorb the first impact of a crash. Turn the vehicle wheels so that if it was struck, it would swing away from the worksite. Cones or other traffic channeling devices must be at the proper taper length and spacing to provide adequate warning to on-coming traffic. In addition, proper PPE is to be worn during traffic operations, to include hardhat and high-visibility vests. Refer to [S3NA-306-PR Highway and Road Work](#).

When working in high traffic areas, the following precautions will be implemented so that motorists are warned of your presence:

- Wear an ANSI-approved Class II safety vest.
- Set up work zone signs at a minimum of 150 feet in front of the work area.
- Taper cones at least 125 feet in front of work zone.
- Position vehicle upstream from work site to begin channeling traffic.
- Designate work zone with cones.
- Taper cones at least 50 feet downstream from work zone.
- Use trained flaggers.
- Use the services of local law enforcement to maintain traffic control, where deemed appropriate.

Figure 1 Blue print of work area

Blueprint of work area

6.14.1 Site-Specific Traffic Safety and Control Plan

A site-specific [Traffic Safety and Control Plan](#) ("TSCP") has been prepared to support RAWP and IRMWPs #1 activities. This TSCP has been prepared to assist in traffic control, and motorist and community safety during the IRM trucking activities, and to facilitate early discussion with stakeholders regarding the potential impact of IRM activities on local traffic and the community. In addition, emergency responders will be informed and consulted regarding the location of the truck routes and safety measures described in this plan. This TSCP may be updated as necessary and also used for future remedial activities at the Garfield Avenue Group of Sites.

6.15 Utility Hazards

6.15.1 Underground Utilities

Law requires that a utility clearance be performed prior to initiation of any subsurface work. The number to call in this area to request a mark-out of natural gas, electric, telephone, cable television, water and sewer lines in the proposed excavation or boring locations is 811. Additional information on underground utilities can be found in [S3NA-417-PR Utilities, Underground](#).

The PPG Remediation Contractor or AECOM's Contractor will be responsible to perform the NJ One Call notification. Work will not begin until the required utility clearances have been verified or performed.

Utility clearance organizations typically do not mark-out underground utility lines that are located on private property. As such, Contractor must exercise due diligence and try to identify the location of any private utilities on the property being investigated. This element will be fulfilled in several ways, including:

- Obtaining as-built drawings for the areas being investigated from the property owner;
- Visually reviewing each proposed excavation location with the property owner or knowledgeable site representative;
- Performing a geophysical survey to locate utilities;
- Hiring a private line locating firm to determine the location of utility lines that are present at the property;
- Identifying a no-dig zone;
- Use of air or hydro vacuum extraction methods; or
- Hand digging in the proposed excavation locations if insufficient data is available to accurately determine the location of the utility lines.

Non-destructive vacuum extraction, otherwise known as Potholing or air-knifing, is used to physically expose a marked utility to verify existence and determine its exact location. This method helps reduce the potential for damage to an existing utility by construction activities. A typical pothole measuring 12 inches square and 4 to 5 feet deep can be dug in 15 minutes or less with an average time of 7 to 8 minutes in all soil conditions.

An air knife (Vacuum Excavating) may be used for utility clearance prior to any ground intrusion, such as drilling, backhoe, and other heavy equipment. The air knife is particularly useful when public utility maps show lines extending on to a site, but private records cannot confirm onsite locations. The air knife is the best alternative to conventional hand clearing, such as the hand auger, post-hole digger or spud bar and hammer. An air knife is capable of penetrating soil and exposing utility lines with minimal risk to the lines.

6.15.2 Overhead Utilities

Accidental contact with an energized line or arcing between a high power line and grounded equipment can cause electrocution of equipment operators or nearby ground personnel, and damage to power transmission and operating equipment. While maintaining a safe distance from all energized lines is the preferred means for control of this hazard, site conditions may not always accommodate this.

If work will (or may) occur within 50 feet of any energized line. The safe working distance to an energized line is the minimum distance which must be maintained between any energized electrical line and any part of the operating equipment to maintain adequate safety margins, and is based on the line voltage of the power line. The following safe working distance criteria will be applied for all AECOM operations:

- Determine the voltage of the power line by contacting the utility company or owner;
- Unless verified, it will be assumed that all lines are energized;
- Line Voltage (Kilovolts) Minimum Safe Working Distance (refer to minimum safe working distance in the table below); and
- Additional information on Overhead Electrical Lines can be found in [S3NA-406-PR Electrical Lines, Overhead](#).

Line Voltage (Kilovolts)	Minimum Safe Working Distance
0 – 50	10 feet
>50 – 200	15 feet
>200 – 350	20 feet
>350 – 500	25 feet
>500 – 750	35 feet
>750 – 1000	45 feet
Source: American National Standards Institute, Publication B30.5	

7.0 Safe Work Standards and Rules

7.1 Introduction

As a minimum all employees are responsible for adhering to all AECOM safe work standards, rules, requirements and instructions presented below:

7.1.1 Safe work practices

1. Perform all job duties in a responsible manner, following and complying with regulatory standards, AECOM safety policies, industry standards, work practices, guidelines, and project-specific requirements governing the scope of work.
2. Be aware of the job site conditions, work environments, client operations, contractor activities, and general public (if applicable) that may impact an employee or be impacted by or affected by one's work.
3. Work in a manner that will not put oneself, other personnel or equipment or facilities at risk.
4. Identify hazardous conditions and activities in the work environment consistent with the job and training.
5. If one cannot remove a hazard, it should be reported to the SSO, CM, TM, and/or PM promptly.
6. Implement established control methods consistent with project procedures and/or training.
7. Unsafe employee actions or behavior are prohibited.
8. Employees performing inspections, construction observations, investigations, reviews, surveys or visits to remote sites shall work in teams of a minimum of two persons present (buddy system), or an alternate communication plan must be provided.
9. Work involving the removal, handling, storage or disposal of hazardous materials or wastes requires the approval of the appropriate SH&E Department representative.
10. Immediately report all potentially dangerous conditions and injuries, regardless of severity, to the Field Task Manager.
11. Report all accidents that result in medical treatment, AECOM equipment damage or near miss incidents to supervision immediately.

7.1.2 Personal standards

1. Any employee who willfully disregards AECOM or client safety standards, rules or requirements is subject to disciplinary action, including removal from the project and dismissal.
2. Carrying firearms or other weapons on AECOM or a client's property is prohibited.
3. Fighting and gambling are not permitted.

4. Be considerate of the safety and welfare of others. Distracting other's attention or engaging in practical jokes and horseplay is prohibited.
5. Employees are not permitted to use, sell or distribute, be under the influence, or have in their possession any controlled substances, drugs, or alcohol. The only exception is if an employee is taking prescription medication(s) under the direction of a physician. It is then the responsibility of the employee to notify one's PM if the medication may impair their ability to perform their job function in a safe manner, in which case they shall be removed from that task.
6. Smoking is prohibited in any area specifically designated as "NO SMOKING" and in all AECOM facilities.
7. Be alert at all times. Obey safety signs, heed warning signs and instructions.
8. Report unsafe equipment, conditions, and actions or behavior to one's task leader or supervisor promptly.
9. Avoid back injuries by knowing one's capabilities, using proper lifting techniques, and seeking assistance when needed.
10. Employees should operate vehicles in a safe and conscientious manner.
11. All employees shall direct any questions or concerns they may have about the project HASP, job tasks, instructions or conditions to the PM or RSHEM.

7.1.3 General safety rules

1. Employees are required to practice "good housekeeping" when performing job tasks at all AECOM locations and offices. Such practices include overseeing that work areas are kept clean and organized; using approved cleaning materials for tools and equipment; proper packaging and disposal of waste materials including hazardous materials; and leaving a work area clean and orderly. This includes office work stations and occupancies.
2. One should plan work tasks before beginning work and consider any hazards that may exist and how to avoid them through proper work practices.
3. One should keep an eye out for and take care of one's "buddy" in the field.
4. Obey all warning signs (e.g., "Do Not Enter," "No Smoking," "Eye, Hearing or Respiratory Protection Required," "Permit Required Confined Space," "Authorized Personnel Only," etc.).
5. Do not jump from any elevated surface or platform, including truck beds, equipment and scaffolding.
6. Taking shortcuts leads to injury. Use appropriate ladders, platforms and stairs.
7. Do not block, deface or remove any signage, barricade or fencing without approval.
8. Keep passageways clean and clear of debris, materials, hoses, cords, and tripping obstructions. Items should be moved to low activity areas or overhead.
9. Permits may be required when performing non-routine tasks and work involving hazards. Seek advice from the SSO, CM, TL, or PM as appropriate.

10. Use only designated sanitary facilities.
11. Be alert to work going on, around or above you including contractor activities and motoring public vehicles.
12. Be familiar with project emergency procedures. Report all emergency situations to the PM immediately.
13. Read scaffolding tags before using scaffolds. Never use a red-tagged scaffold. Climbing on an incomplete scaffold (normally yellow tag) requires use of and tying off of fall protection devices.
14. Hand tools, electronic devices and equipment may not be used for any purpose other than their intended use. Damaged equipment and tools with worn part(s) shall be reported to a supervisor or task leader for repair or replacement.
15. Electric power tools must be properly grounded or double insulated. Electric power tools shall be Ground Fault Circuit Interrupter-protected when use in wet and exterior conditions.
16. Defective tools and equipment, frayed and ungrounded electrical cords and unguarded tools and machinery shall not be used. Report same to the SSO, CM, TL, or PM as appropriate.
17. Employees shall not remove floor covering, guard rails, or other working surfaces from any floor or perimeter side opening without approval by the SSO, CM, TL, or PM as appropriate.
18. Defective or unsecured ladders shall not be used.
19. Employees shall not ascend or descend a ladder without free use of both hands while facing the ladder.

7.1.4 Safety equipment rules

1. Always wear assigned safety equipment and PPE.
2. Always use protective equipment in accordance with manufacturer's instructions and AECOM training and procedures.
3. All AECOM employees, subcontractors, sub-consultants, visitors, and vendors shall wear a hard hat, high visibility vest, sturdy work boots and eye protection on construction projects. Other PPE may be required based on the nature of the work.
4. Wear clothing suitable for the work being performed. Minimum attire consists of long pants and shirt with a minimum 4-inch sleeve, tank tops are not permitted unless otherwise specified.
5. Hearing protection devices shall be used when exposed to elevated noise levels.
6. Respirator use may be required in areas where dust, gas or fumes exist. Consult the SSO, CM, TL, or PM as appropriate or the RSHEM for guidance.
7. Fall protection equipment is required for all work with a fall exposure greater than six feet on any elevated structure or aerial platform including structural steel, incomplete work platforms, scaffolding, open surface work and aerial lifts.
8. Modification or alteration of any safety equipment is prohibited as it changes the equipment's design strength and manufacturer's certifications.

9. PPE use shall be consistently enforced in accordance with rules established for the project and federal and state safety regulations.

7.1.5 Work ergonomic rules

1. Use proper methods to perform all job functions so as to minimize the risk of physical injury.
2. Take reasonable precautions when lifting heavy or large objects that could cause back injury or hernia.
3. Do not exceed one's capability and strength. Seek assistance.
4. Make suitable adjustments to one's workstation including office furniture, chair, keyboard platform, computer monitor for comfort, equipment and work.
5. Avoid routine, repetitive motion hand activities. Integrate varying motions and body parts.
6. Change work routines, (e.g., phones, typing, files). Stretch and take mini-breaks.

7.1.6 Hazardous Waste Site Rules

1. The "buddy system" will be used at all times by all field personnel. If an employee will be alone in a work area, or an alternate communication plan must be developed (see [SH&E SOP 314 – Working Alone](#)). Subcontractors working on-site with AECOM employees can help fulfill the role of a Buddy while site activities are occurring.
2. Eating, drinking, chewing gum or tobacco, smoking or any practice that increases the probability of hand-to-mouth transfer and ingestion of materials is prohibited in the immediate work area and the decontamination zone. Water and Ice may be consumed in all areas to prevent heat stress but precautions must be taken to prevent contamination of the water and ice.
3. Smoking is prohibited in all work areas. Matches and lighters are not allowed in these areas.
4. Hands and face must be thoroughly washed upon leaving the work area and before eating, drinking or any other activities.
5. Beards or other facial hair that interfere with respirator fit are prohibited, if the potential for respirator use is imminent.
6. All equipment must be decontaminated or properly discarded before leaving the site in accordance with the project work plan.
7. Avoid contact with potentially contaminated substances or materials. Do not walk through puddles, pools, mud, or handle soils without protective gloves, etc. Avoid, whenever possible, kneeling on the ground, leaning or sitting on equipment or the ground. Do not place monitoring equipment on potentially contaminated surfaces (e.g., ground, etc.).
8. Field personnel will perform only those tasks which they are qualified to perform.

8.0 Air Monitoring

AECOM will be implementing a comprehensive air monitoring plan during the implementation of the IRM activities at the Garfield Avenue site (114) and proposed Carteret Avenue South location. This plan includes both real time and integrated sampling for total particulates (as a surrogate for hexavalent chromium) and total VOCs at the Exclusion Zone and the perimeter of the site and is used mainly for the protection of the public. The Exclusion Zone monitoring stations mentioned in this plan will also be used to monitor worker exposure. But if the work performed is deemed a high risk for creating dust or dust exposure, a personal air monitor can be used. The action levels for worker exposure are included in this section.

In work areas outside of the IRM activities, and therefore outside on the on-site air monitoring area, an exclusion zone and work area air monitoring system will be set up according to the AMP in each area. The SSO or FTL are responsible for following the AMP procedures when outside of the main site area.

Additional information on the air monitoring program can be found in the AMP for Ground Intrusion Activities at the Garfield Avenue Site.

8.1 Volatile Organic Vapors

A portable photo-ionization detector ("PID") with a 10.6 electron volt ("eV") lamp will be utilized to periodically monitor the levels of total volatile organic compound in the ambient air. Measurements will be taken from the breathing zone (4 to 5 feet above ground level) at worker locations to determine working conditions and whether there is a need to change levels of worker protection. The PID unit collects and analyzes air continuously. In order to make a conservative assessment of when different levels of respiratory protection are needed during the fieldwork, it will be assumed that the organic vapors detected by the air monitoring instruments consist of the most toxic volatile compounds expected to be found on the site. Preliminary evaluation of the risks expected at the site indicates that the most toxic volatiles that are expected to be present are VOCs (particularly Benzene, Toluene, Ethylbenzene, Xylene [BTEX]). Based on data published by the OSHA and the ACGIH, and previous experience with MGP wastes, the following PPE will be employed when the given concentrations of organic vapor are detected in the breathing zone.

VOC Action Level

As a precautionary measure, a PID with a 10.6 eV lamp will be used to monitor the breathing zone of personnel during the intrusive activities. In addition, a robust Air Monitoring Plan has been developed that details the dust and VOC monitoring and sampling/analysis that is proposed to be performed during site activities. If PID readings collected in the Exclusion Zone indicate sustained (15 minute) breathing zone vapor concentrations in excess of 5 ppm above background AECOM personnel should leave the area immediately.

Task	Instrument	Action Limit and Action
All tasks involving potential exposure to contaminated soils and/or groundwater	Photo-ionization Detector	5 ppm above back ground; Leave the area immediately or don respiratory protection as discussed in Section 9 . Over 50 ppm-level area and notify RSHEM

8.2 Dust and PM10

The DataRAM Model DR 1000 Aerosol Monitor (or equivalent) measures concentrations of airborne dust, smoke, mists, haze and fumes with real-time readout. The instrument can be used for exposure sampling of ambient air, as well as environmental and perimeter monitoring during intrusive work. The DataRAM has the widest measurement range of any real-time aerosol monitor - from 0.0001 mg/m³ to 400 mg/m³, or a total span of almost seven decades.

Dust and PM10 Action Level

A dust Action Level has been established for the protection of workers from potential health hazards associated with dust in and around the Exclusion Zone. The Dust Action Level based on the airborne concentration of hexavalent chromium will also apply to concrete dust/silica dust. The justification for this Action Level is provided below. Worst case concentrations of hexavalent chromium will be removed during IRM #1 and IRM #2 activities; as a result, a more conservative dust action level was calculated for use during remedial excavation during IRM #1 and IRM #2, as discussed further below.

Soil sampling at PPG sites has revealed elevated levels of hexavalent chromium ("Cr⁺⁶") were noted in soils. Air monitoring will be required during any intrusive work in Site. The Action Level ("AL") for dust in the Exclusion/Work Zone during intrusive work in this area(s) will be set at 167 µg/m³ or 0.167 mg/m³. The AL for particulates while intrusive activities are occurring in the Cr⁺⁶-impacted area(s) was derived as follows:

Cr⁺⁶ Action Level in Air in Exclusion/Work Zone:

Cr⁺⁶ PEL = 0.005 mg/m³

Divide PEL for Cr⁺⁶ by 2 as a safety factor

Modified PEL = 0.0025 mg/m³

The 95% upper confidence limit ("UCL") on the arithmetic mean for soil samples in the area was calculated to be 15,000 mg Cr⁺⁶/kg soil, or 1.5% Cr⁺⁶ in soil (represents the 95% UCL of the arithmetic mean of the concentrations found within the most impacted area of the site found in soil on PPG Sites)

Action Level (above background) is calculated by dividing the modified PEL by the expected maximum detected concentration of Cr⁺⁶ as follows:

AL = 0.0025 divided by 0.015

AL = 0.167 mg/m^3 or $167 \mu\text{g/m}^3$

Therefore, for worker's in the Exclusion Zone, $167 \mu\text{g/m}^3$ (above background) will be set as the Action Level for total dust ("PM10") (based on Cr^{+6}) during intrusive work during remedial activities.

Task	Instrument	Action Limit and Action
All tasks with the potential to generate dust.	Particulate meter	0.167 mg/m^3 above background. Implement control measures Implement dust control

The action level is conservative and adequately protective of human health since it is based upon an assumption that the 95% UCL concentration of Cr^{+6} in soil is representative of the Cr^{+6} concentration in all dust, meaning that no other dust sources contribute to measured levels.

If the Exclusion Zone aerosol monitor indicates sustained (15 minute) breathing zone vapor dust in excess of 0.167 mg/m^3 above background or visible dust is present AECOM personnel should leave the area immediately.

The protectiveness of worker's health by using this action level will be demonstrated by reviewing hexavalent chromium concentrations in dust collected at the Exclusion Zone Air Monitoring Stations ("AMSs") (the details of the AMSs are described in the AMP). Specifically, the laboratory analytical results will be reviewed as they are received to confirm that the concentration of hexavalent chromium in dust is less than the 95% UCL of $15,000 \text{ mg/kg}$ which was conservatively utilized to develop the action level. By confirming that the concentration of hexavalent chromium in dust is consistently below the 95% UCL, the protectiveness of the AL will have been verified. This data comparison will occur almost daily as the results are received from the laboratory, and the results and evaluations will be maintained in a site log with the HASP.

8.3 Calibration and Recordkeeping

Calibration and Recordkeeping will be conducted in accordance with the project QAPP and AECOM [SOP Q2-312-PR "Monitoring and Measurement Equipment Procedure"](#).

Air monitoring instrumentation will be bump tested or fully calibrated before each day's use in accordance with the manufacturer's instructions. A log of the calibrations and readings will be kept in the field notebook. Daily calibration information will also be recorded in the field notebook. Calibration procedures will be documented in the field records. Documentation will include the date and time of calibration, the identity of the person performing the calibration, the reference standard used, the readings taken, and any corrective action. This information will be incorporated into the appropriate reports to be submitted to NJDEP for review. In addition to the manufacturer's recommended calibration procedures and frequencies, the contractor's preventive maintenance and internal calibration schedule will be provided and kept at the site for review by the NJDEP auditor. Field instruments will be calibration checked at a minimum of twice daily, before and after use. A calibration curve will be run every six (6) to eight (8) weeks. Documentation will also include the calibration curve, as well as a log of field calibration dates and standards.

A PID is bump tested in the field as a means of verifying calibration by using a known concentration of test gas (isobutylene) will be performed before daily use to demonstrate that the instrument's response to the test gas is within acceptable limits ($\pm 10\%$ or $\pm 15\%$).

The particulate meter will be functional tested in zero/clean air following the manufacturer's instructions. The digital dust meter will be maintained in accordance with the manufacturer's instructions. Functional tests shall be recorded in a field notebook.

Detail description of equipment calibration and quality assurance/quality control ("QA/QC") procedures can be found in Section 8.1 of the AMP.

Particulate Monitors

The TSI DustTrak and DataRam Model DR 1000 Aerosol Monitors or equivalent devices will be used to continuously monitor particulate emissions at the various fence line locations. At a minimum, the monitors will be field checked daily using zero calibration air. At the beginning of each workday (prior to site intrusive activities each day) a calibration zero check will be performed on each unit at the measurement locations. A zero (or particulate-free) test sample, using the appropriate particulate filter supplied by the manufacturer for this purpose, will be placed over the sample inlet. The data output for the monitor will be observed and the response recorded in the air monitoring contractor's field logbook. Once per month, all PM10 samplers will be challenged with an unknown upscale amount of particulates in order to verify each sampler's response to upscale particulate levels. The data output for the monitor will be observed and the response recorded in a field logbook.

TVOC Monitors

The calibration of the PID analyzers will be accomplished at the beginning of each day using a cylinder of isobutylene calibration gas. The calibration gas will be used to fill Tedlar bags which will be brought to each PID. The PIDs will be zeroed in the same manner using bags filled with ultra-pure air. The instrument response to the calibration points will be checked to determine instrument performance. The data output will be observed and the response recorded in the field logbook. The field logbook will be maintained on-site throughout the duration of site activities.

8.4 Personal Air Sampling

Personal exposure assessment will be conducted only when the action levels are exceeded for VOCs/benzene and hexavalent chromium/total dust. Personal air samples will be collected in accordance with OSHA and/or NIOSH methodology and analyzed by an American Industrial Hygiene Association ("AIHA") accredited laboratory. The results of the sampling will be communicated to project personnel. The number of workers selected to wear the personal sampling pumps will be determined in advance of the field activity by AECOM's RSHEM. Personal hydrogen sulfide monitor will be performed on at-risk employees by using a clip-on disposable hydrogen sulfide detector with a low alarm range of 5 ppm.

Analytical Methods

- Benzene- 29 CFR 1910.1028 (e) - Analytical Method 12`
- Hexavalent Chromium- 29 CFR 1910.1026(d)-Analytical Method OSHA ID-215
- Dust-NIOSH Analytical Method- 0500

9.0 Personal Protective Equipment

The purpose of PPE is to provide a barrier, which will shield or isolate individuals from the chemical and/or physical hazards that may be encountered during work activities. [S3NA-208-PR Personal Protective Equipment Program](#) lists the general requirements for selection and usage of PPE. The specific PPE requirements for each work task are specified in the individual THAs.

9.1 Level D Ensemble

Level D PPE for this project shall consist of: shirts with sleeves and long trousers that are ankle length; approved hard hats, safety spectacles with side shields, steel-toe protective footwear and a high visibility vest or other high visibility outer garment when in construction area or other non-office work areas. In addition, employees are required to use the appropriate protective gloves and carry gloves with them at all times when in the construction area or other non-office work areas. As necessary hearing protection will be used.

9.2 Modified Level D Ensemble

Level D ensemble will be modified to where there is a potential for dermal (skin) exposure to the chemical contaminants of concern. Modified Level D ensemble will consist of the PPE required for Level D with the addition of the following:

- Chemical-resistant coveralls (Tyvek)
- Inner gloves: Best Safety N-DEX or equivalent
- Outer gloves: Ansell-Edmont SOL-VEX (Nitrile) or equivalent

9.3 Personal Protective Equipment

<u>Type</u>	<u>Material</u>	<u>Additional Information</u>
Minimum PPE		
High visibility Garment	ANSI Type II high-visibility	Must have reflective tape/be visible from all sides
Boots	Leather or rubber	ANSI approved safety toe
Safety Glasses		ANSI Approved; ≥98% ultraviolet (UV) protection
Work Gloves	Leather or Kevlar	If working with sharp objects or powered equipment.
Hard Hat		ANSI Approved; recommended wide-brim
Hearing Protection	Ear plugs and/ or muffs	In hazardous noise areas

Additional PPE:		
Protective Chemical Gloves	Inner: Disposable nitrile Outer: Nitrile	Disposable nitrile gloves
Protective Chemical Coveralls	Inner: Work Uniform Outer: Tyvek	
Protective Chemical Boots		Rubber over boots
Level C Respiratory Protection	Air Purifying Respirator ("APR") organic vapor cartridges P-100 filter dust or combination cartridge.	5 ppm of organic vapors in breathing zone
Face Shield		Safety glasses or goggles must be worn concurrently.

9.4 Respiratory Protection

Respiratory protection maybe required while engineering controls and other work practice are not effective in preventing employees from airborne contaminates. If needed, work will be stopped and the SSO will be contacted and a THA amendment will be generated to address the use of respiratory equipment.

Where respiratory protection is required to be used personnel shall be trained in the proper care, use limitation of the respiratory device and be medically qualified to wear a respirator. A respiratory fit-test is required prior to first used and annually thereafter. AECOM respiratory protection program can be found in [S3NA-519-PR](#).

9.5 Inspection of PPE

It is the responsibility of each employee to inspect their PPE for defects prior to field activities. Defective PPE must be replaced. Prior to donning PPE must be inspected, for damage or defects. Promptly remove any protective clothing that becomes ripped or torn during a particular task.

9.6 Other Safety Equipment

The following additional safety items will be made available to program staff as necessary and appropriate:

- Portable, hand-held eyewash bottles
- First aid kit
- Type A-B-C fire extinguisher
- Hearing protection
- Portable phones

10.0 Decontamination

10.1 General Requirements

All possible and necessary steps shall be taken to reduce or minimize contact with chemicals and contaminated/ impacted materials while performing field activities (e.g., avoid sitting or leaning on, walking through, dragging equipment through or over, tracking, or splashing potential or known contaminated/impacted materials, etc.). Specific requires for decontamination procedures can be found in [S3NA-521 Decontamination](#).

If possible, personal decontamination activities shall be performed with an attendant (buddy) to provide assistance to personnel that are performing decontamination activities. Depending on specific site hazards, attendants may be required to wear a level of protection that is equal to the required level in the Exclusion Zone.

All persons and equipment entering the Exclusion Zone shall be considered contaminated, and thus, must be properly decontaminated prior to entering the Support Zone.

Decontamination procedures may vary based on site conditions and nature of the contaminant(s). If chemicals or decontamination solutions are used, care should be taken to minimize reactions between the solutions and contaminated materials. In addition, personnel must assess the potential exposures created by the decontamination chemical(s) or solutions. The applicable MSDS must be reviewed, implemented, and filed by personnel contacting the chemicals/solutions.

All contaminated PPE and decontamination materials shall be contained, stored and disposed of in accordance with site-specific requirements determined by site management.

10.2 Decontamination Equipment

The equipment required to perform decontamination may vary based on site-specific conditions and the nature of the contaminant(s). The following equipment is commonly used for decontamination purposes:

- Soft-bristle scrub brushes or long-handled brushes to remove contaminants;
- Hoses, buckets of water or garden sprayers for rinsing;
- Large plastic/galvanized wash tubs or children's wading pools for washing and rinsing solutions;
- Large plastic garbage cans or similar containers lined with plastic bags for the storage of contaminated clothing and equipment;
- Metal or plastic cans or drums for the temporary storage of contaminated liquids; and
- Paper or cloth towels for drying protective clothing and equipment.

Equipment in contact with samples will be decontaminated prior to use to ensure sample integrity. Wherever possible, pre-cleaned, disposable or dedicated equipment will be utilized. All other sampling equipment used in the field investigations will be cleaned before and after sample collection using a three-part decontamination procedure. Cleaning of equipment is performed to prevent cross-

contamination between samples and to maintain a clean working environment for all personnel. Detailed 3-Step decontamination procedures are presented in the QAPP.

Under typical field conditions, the 3-step decontamination process consisting of a laboratory grade glassware detergent (i.e., Alconox®) and tap water scrub to remove visible contamination followed by a generous tap water rinse and a final rinse using distilled and deionized (ASTM Type II) water, will be used for this program. A solvent rinse and acid rinse steps of the full 8-step decontamination process will not be performed during field decontamination. If visual contamination persists, or gross contamination is suspected, additional decontamination procedures will be required (steps 4 through 8 below dependent upon the analysis required) and the 3-step decontamination procedure will be modified:

Eight-Step Decontamination Process:

The field sampling equipment cleaning and decontamination procedures are as follows:

1. Laboratory grade glassware detergent plus tap water wash to remove all visible particulate matter and residual oils and grease (Required);
2. Generous tap water rinse (Required);
3. Distilled and deionized (ASTM Type II) water rinse (Required);
4. 10% nitric acid rinse (trace metal or higher grade HNO₃ diluted with distilled and deionized (ASTM Type II) H₂O)* (As needed);
5. Distilled and deionized (ASTM Type II) water rinse* (As needed);
6. Acetone (pesticide grade) rinse** (As needed);
7. Total air dry or pure nitrogen blow out** (As needed);
8. Distilled and deionized (ASTM Type II) water rinse** (As needed);

*Only if sample is to be analyzed for metals.

**Only if sample is to be analyzed for organics.

All sampling equipment decontaminated via this procedure must be wrapped and/or sealed during storage and prior to use. If visual contamination persists, or gross contamination is suspected, additional decontamination procedures will be required.

In the field, decontamination should be carried out over a container and the residual liquid material must be properly disposed. Decontamination wastes must be disposed in accordance with current NJDEP policy (see Chapter 2 of the *Field Sampling Procedure Manual* (August 2005), Section 2.4.5.7, *Disposal of Development, Purge, Pump Test and Decontamination Water*). Where possible, only dedicated and disposable materials will be used for sample collection to minimize the need for on-site full decontamination.

Decontamination of drilling equipment will be performed by the drilling subcontractor. AECOM will provide the drilling subcontractors with a copy of all the applicable POP(s). Subcontractors will be overseen to ensure that decontamination is completed in accordance with POP PPG 014 and NJDEP *Field Sampling Procedures Manual* (August 2005).

10.3 Personal/Equipment Decontamination

All equipment leaving the Exclusion Zone shall be considered contaminated and must be properly decontaminated to minimize the potential for exposure and off-site migration of impacted materials. Such equipment may include, but is not limited to: sampling tools, heavy equipment, vehicles, PPE, support devices, (e.g., hoses, cylinders, etc.), and various handheld tools.

All employees performing equipment decontamination shall wear the appropriate PPE to protect against exposure to contaminated materials. The level of PPE may be equivalent to the level of PPE required in the Exclusion Zone. Other PPE may include splash protection, such as face-shields and splash suits, and knee protectors. Following equipment decontamination, employees may be required to follow the proper personal decontamination procedures above.

Personnel decontamination should consist of the following glove removal procedure:

- Grasp the cuff of the dominant hand and pull glove over the bulk of the hand, leaving the fingers inside the glove.
- Use the dominant hand to grasp the cuff of the non-dominant hand and pull the glove completely off (inside-out) and place inside of the dominant hand glove.
- Once removed, employee should only touch the inside material of the dominant hand glove.
- Thoroughly wash hands.

For larger equipment, a high-pressure washer may need to be used. Some contaminants require the use of a detergent or chemical solution and scrub brushes to ensure proper decontamination. Before heavy equipment and trucks are taken offsite, the Site Supervisor and/or SSO will visually inspect them for signs of contamination. If contamination is present, the equipment must be decontaminated.

For smaller equipment, use the following steps for decontamination:

1. Remove majority of visible gross contamination in Exclusion Zone.
2. Wash equipment in decontamination solution with a scrub brush and/or power wash heavy equipment.
3. Rinse equipment.
4. Visually inspect for remaining contamination.
5. Follow appropriate personal decontamination steps outlined above.

All decontaminated equipment shall be visually inspected for contamination prior to leaving the Contaminant Reduction Zone. Signs of visible contamination may include an oily sheen, residue or contaminated soils left on the equipment. Equipment with visible signs of contamination shall be discarded or re-decontaminated until clean. Depending on the nature of the contaminant, equipment may have to be analyzed using a wipe method or other means.

AECOM employees will follow the decontamination procedures implemented on the site by the PPG contractor if when exiting the Exclusion Zone.

11.0 Site Control

11.1 General

The purpose of site control is to minimize potential contamination of workers, protect the public from site hazards, and prevent vandalism. The degree of site control necessary depends on the site characteristics, site size, and the surrounding community.

Controlled work areas will be established at each work location, and if required, will be established directly prior to the work being conducted. Controlled work areas will be established during the daily safety meetings. If the site layout changes, the new areas and their potential hazards will be discussed immediately after the changes are made.

11.2 Controlled Work Areas

Each HAZWOPER controlled work area will consist of the following three zones:

- Exclusion Zone: Contaminated work area.
- Contamination Reduction Zone: Decontamination area.
- Support Zone: Uncontaminated or “clean area” where personnel should not be exposed to hazardous conditions.

Each zone will be periodically monitored in accordance with the air monitoring requirements established in this HASP. The Exclusion Zone and the Contamination Reduction Zone are considered work areas. The Support Zone is accessible to the public, (e.g., vendors, inspectors).

11.2.1 Exclusion Zone

The Exclusion Zone is the area where primary activities occur, such as sampling, remediation operations, installation of wells, cleanup work, etc. This area must be clearly marked with hazard tape, barricades or cones, or enclosed by fences or ropes. Only personnel involved in work activities, and meeting the requirements specified in the applicable THA and this HASP will be allowed in an Exclusion Zone.

The extent of each area will be sufficient to ensure that personnel located at/beyond its boundaries will not be affected in any substantial way by hazards associated with site activities.

- **Drilling.** Determine the mast height of the drill rig. This height will be cleared, if practical, in all directions from the bore-hole location and designated as the Exclusion Zone. The cleared area will be sufficient to accommodate movement of necessary equipment and the stockpiling of spoils piles. Vehicles and other hard barriers should be used where applicable to protect employees and public.
- **Hand Augering/Vacuum Excavation and Clearance.** A distance of 10 feet will be cleared in all directions from the sampling location in order to accommodate additional sampling equipment. Vehicles and other hard barriers should be used where applicable to protect employees and public.

- AECOM typically establishes the Exclusion Zone; however for Garfield Avenue Group remedial activities, the PPG Contractor is responsible for establishing the Exclusion Zone around the work area or temporary stockpile areas and where contamination is present or suspected.

All personnel should be alert to prevent unauthorized, accidental entrance into controlled-access areas (the Exclusion Zone and Contamination Reduction Zone). If such an entry should occur, the trespasser should be immediately escorted outside the area, or all HAZWOPER-related work must cease. All personnel, equipment, and supplies that enter controlled-access areas must be decontaminated or containerized as waste prior to leaving (through the Contamination Reduction Zone only).

11.2.2 Contamination Reduction Zone

The Contamination Reduction Zone is the transition area between the contaminated area and the clean area. Decontamination is the main focus in this area. The decontamination of workers and equipment limits the physical transfer of hazardous substances into the clean area. This area must also be clearly marked with hazard tape and access limited to personnel involved in decontamination.

Vehicles, equipment and personnel will exit the Exclusion Zone through the Contamination Reduction Zone before entering the support area. All heavy equipment used in the Exclusion Zone shall be decontaminated on the decon pad using a pressure washer prior to entering the support zone.

11.2.3 Support Zone

The Support Zone is an uncontaminated zone where administrative and other support functions, such as first aid, equipment supply, emergency information, etc., are located. The Support Zone shall have minimal potential for significant exposure to contaminants (i.e., background levels).

Employees will establish a Support Zone (if necessary) at the site before the commencement of site activities. The Support Zone would also serve as the entry point for controlling site access.

11.2.4 Site Access Control

Security at Site 114 is maintained by PPG. All personnel entering Site 114 must sign in/out with the Security Officer on duty and then report to the AECOM Field Office to check in with the CM and/or SSO.

11.2.5 Parking and Staging Areas

Parking at Site 114 will be restricted to areas designated by PPG's contractor. At other sites where vehicles parked on the public streets will be marked with cones both in front of and behind the vehicle.

12.0 Medical Monitoring and Training Requirements

All AECOM Contractor/Subcontractors employee subject to this HASP shall provide copies of documentation indicating that the requirements for training, medical surveillance, and respirator use are current. Copies of these documents shall be made available to AECOM or AECOM's client upon request.

12.1 Medical Monitoring

All personnel performing activities covered by this HASP must be active participants in a medical monitoring program that complies with 29 CFR 1910.120(f). Each individual must have completed an annual surveillance examination and/or an initial baseline examination within the last year prior to performing any work on the site covered by this HASP. The AECOM medical monitoring includes the medical evaluation criteria for respirator use as found in 29 CFR 1910.134 (c) (1) (ii).

12.2 Health and Safety Training

12.2.1 HAZWOPER

All personnel performing activities covered by this HASP must have completed the appropriate training requirements specified in 29 CFR 1910.120 (e). Each individual must have completed an annual 8-hour refresher training course and/or initial 40-hour training course within the last year prior to performing any work on the sites covered by this HASP.

12.2.2 Hexavalent Chromium

As required by [29 CFR 1910.1026\(l\)](#) personnel exposed to or have a potential to be exposed to hexavalent chrome will be trained in the provisions of the hexavalent chromium standard, medical monitoring requirements, health hazards of hexavalent chrome and methods used to control/eliminate exposure to hexavalent chromium.

12.2.3 Treatment Chemical Training

Chemical specific training will be required for personnel involved with the pilot scale treatment studies for groundwater and saturated soils. The training will cover: safe handling procedures, protective garments to be used, health hazards and emergency procedures.

12.2.4 Pre-Entry Briefing

Prior to the commencement of project activities, a pre-entry briefing will be conducted by the AECOM SSO to review the specific requirements of HASP, applicable site rules, PPE requirements, MSDSs etc. Attendance at the pre-entry meeting is mandatory for all personnel covered by this HASP and must be documented on the tailgate meeting attendance form provided in **Appendix C**. All documentation should be maintained in the project file.

12.2.5 Tailgate Meetings

Tailgate safety meetings will held at the beginning of each task or work operation and at least daily thereafter, according to the various circumstances involved or when necessary to clear working procedures. Attendance at the daily tailgate meeting is mandatory for site personnel and must be

documented on the tailgate meeting attendance form provided in **Appendix C**. All documentation should be maintained in the project file.

Meetings will cover relevant health and safety issues, site activities, changes in site conditions, and a review of topics covered in the pre-entry briefing as they apply to daily activities. As part of the tailgate safety meeting, employee feedback (comments, questions, health or safety concerns) are welcomed. Issues addressed in the safety meetings will be documented and shall include the date, attendees, subjects discussed and names of individual(s) who conducted the meeting.

12.2.6 Contractors Briefing

AECOM employees working on the 114 site shall attend the PPG contractor's pre-entry briefing/daily tailgate meeting, as a means of orientating themselves to site condition, health and safety requirements and hazards controls measures.

13.0 Emergency Response

OSHA defines emergency response as any "response effort by employees from outside the immediate release area or by other designated responders (i.e., mutual-aid groups, local fire departments, etc.) to an occurrence which results, or is likely to result in an uncontrolled release of a hazardous substance.

AECOM personnel shall not participate in any emergency response where there are potential safety or health hazards (i.e., fire, explosion, or chemical exposure). AECOM response actions will be limited to evacuation and medical/first aid as described within this section below. As such this section is written to comply with the requirements of 29 CFR 1910.38 (a).

The basic elements of an emergency evacuation plan include:

- Employee training;
- Alarm systems;
- Escape routes;
- Escape procedures;
- Critical operations or equipment;
- Rescue and medical duty assignments;
- Designation of responsible parties;
- Emergency reporting procedures; and
- Methods to account for all employees after evacuation.

13.1 Employee Training

Employees must be instructed in the site-specific aspects of emergency evacuation. On-site refresher or update training is required anytime escape routes or procedures are modified or personnel assignments are changed.

13.2 Alarm System/Emergency Signals

An emergency communication system must be in effect at all sites. The simplest and most and effective emergency communication system in many situations will be direct verbal communications. Each site must be assessed at the time of initial site activity and periodically as the work progresses. Verbal communications must be supplemented anytime voices cannot be clearly perceived above ambient noise levels (i.e., noise from heavy equipment; drilling rigs, backhoes, etc.) and anytime a clear line-of-sight cannot be easily maintained amongst all AECOM personnel because of distance, terrain or other obstructions.

Verbal communications will be adequate to warn employees of hazards associated with the immediate work area. The property is un-occupied and AECOM will not have access to facility phones. Therefore,

AECOM will bring a portable phone to the site to ensure that communications with local emergency responders is maintained, when necessary.

13.3 Escape Routes and Procedures

The escape route from the site and an emergency muster point will be determined and provided to all workers during the project mobilization.

Prior to mobilizing to a new project area, the SSO or his designee will confirm that the escape routes are clear and lead to a safe area.

13.4 Employee Accounting Method

The AECOMs on site team leader/SSO is responsible for identifying AECOM personnel on-site at all times. AECOM Contractors/Subcontractors will notify the SSO when they enter and leave the site. The team leader/SSO will account for all AECOM personnel following an evacuation. The daily Tailgate Meeting form can be used as an attendance sheet to account for employees or a separate sign/out sheet can be maintained.

13.5 Critical Operations

There are no critical operations that would require AECOM employees to remain behind or enter an area during an emergency.

13.6 Injuries and Illnesses

The phone numbers of the police and fire departments, ambulance service, local hospital, and AECOM representatives are provided in the emergency reference sheet **Table 13-1**. This sheet will be posted in the site vehicle.

13.6.1 First Aid

Minor injuries will be treated on site using materials from the first aid kit or other local sources. All cuts and abrasions will be cleaned with potable water and a clean dressing applied. The injured employee will be evaluated at the end of the work day and the following day when the employee arrives at the project site to determine whether the wound has started the healing process. The wound will be protected from contamination during the project activities.

13.6.2 Professional Treatment

In the event of a non-critical injury, and once preliminary reporting been completed, if the injured employee desires/needs to speak with a medical professional to consult on the nature of their injury and treatment options, employees should contact the RSH&E manager who will contact WorkCare. Once contacted, WorkCare will make direct contact with the employee.

Once the injury has been reported, seek treatment (i.e. injuries of the First Aid variety) at the identified non-critical care facility indicated on the THA.

If the injured employee can be moved from the accident area, he or she will be brought to the Contamination Reduction Zone where their PPE will be removed. If the person is suffering from a back or neck injury the person will not be moved and the requirements for decontamination do not apply. The SSO must familiarize the responding emergency personnel about the nature of the site and the injury. If

the responder feels that the PPE can be cut away from the injured person's body, this will be done on-site. If this not feasible, decontamination will be performed after the injured person has been stabilized.

13.7 Incident Response Procedures

13.7.1 Fire

During the incipient phase of the fire, personnel who have been trained and are willing to do so shall deploy a portable fire extinguisher or other effective means for extinguishing a fire (water, soil, blanket etc.), to stop the incipient fire from growing larger. If the fire cannot be prevented from growing larger or extinguished within 30 seconds, the person shall flee the area. Regardless of the effort used to extinguish the incipient phase of the fire, the local fire department shall be notified by calling 911 to report the fire.

- Call the fire department.
- Evacuate the affected area or initiate evacuation by sounding the alarm or verbally warning others. Do not return to burning or smoked-filled areas.
- Report to the designated assembly area.

Dispatch a person to greet the fire department and lead them to the scene.

13.7.2 Medical Emergency Response

The term "medical emergency" means different things in different contexts. In regards to a person, a medical emergency is any life-threatening condition that requires immediate medical intervention to restore breathing, control bleeding, restore circulation, or prevent shock. In regards to incidents on the job, a medical emergency is also an event in which two or more people receive injuries as the result of single incident.

The immediate response to either type of medical emergency is as follows:

- Take control of the situation.
- Ensure personal safety and the safety of others.
- Assist and evaluate the victim(s). Do not try to move the victim(s).
- Direct someone to call 911.
- Dispatch a person to greet the fire department or ambulance and lead the emergency personnel to the scene.
- Do not attempt to perform any type of technical rescue.

13.7.3 Release of Oil or Hazardous Materials

"Emergency response" or "responding to emergencies" means a response effort by employees from outside the immediate release area or by other designated responders (i.e. mutual aid groups, local fire departments, etc.) to an occurrence which results, or is likely to result, in an uncontrolled release of a hazardous substance. Responses to incidental releases of hazardous substances where the substance can be absorbed, neutralized, or otherwise controlled at the time of release by employees in the immediate release area or by maintenance personnel are not considered to be emergency responses. Responses to release of hazardous substances where there is no potential safety of health hazard (i.e. fire, explosion, or chemical exposure) are not considered to be emergency responses.

Based on the above paragraph AECOM personnel will not respond to emergencies. Nevertheless, personnel may respond to release of hazardous substances where there is no potential safety of health hazard (i.e. fire, explosion, or chemical exposure).

The response for a release of potentially hazardous material entails the following:

- Determine the nature of the substance released.
- Eliminate all sources of ignition.
- Isolate the affected area or initiate area evacuation.
- Contain the flow of the material from the source if this can be done safely.
- Following the procedures and using the protective equipment as indicated by the MSDS, contain the release to the smallest area possible, and initiate cleanup.
- Dispose of all residues in accordance with the MSDS.

When on-site efforts cannot mitigate the hazard in a timely manner or the material poses a fire or explosion hazard or is a threat public safety, the site and surrounding area shall be evacuated and the Fire Department shall be immediately notified.

Release of oil or hazardous material must be reported to the AECOM PM and RSHEM, with the PM providing notification to the client representative. At this time a determination will be made by the PM to notify the NJDEP and the National Response Center. After initial response actions have been completed an incident investigation will be performed to determine the root causes of the incident and corrective actions, and lessons learned shall be shared to prevent future reoccurrence.

13.7.4 Electrical Strike

Personnel in the vicinity of the incident shall not touch or come near downed power lines. If a machine (crane or other equipment) becomes energized by an electrical utility, all personnel surrounding the machine shall leave the area immediately.

If the machine is energized, the operator should remain on the machine and avoid moving so as not to change their body position until the electric power has been turned off. The operator may choose to move the machine to break contact with the electric power. The operator should follow the manufacturer's procedure to determine if the machine is electrically charged before attempting to dismount the machine.

If persons are exiting the area of an energized machine, it is advised that they should shuffle their feet while walking away or hop away from the machine until they reach a safe area. Gradient electric current could travel up one leg and down the other if feet are apart (from different voltage potential in the soil).

- Call 911 and the electric utility company.
- Barricade the area to prevent personnel from entering the incident area.
- Medical attention cannot be started until the power is shut off.

13.7.5 Fiber Optic Strike

- Do not look into the cut ends of the cable. This can cause severe eye damage.
- Stop machine operation.
- Contact the utility owner immediately and report the condition.

13.7.6 Natural Gas and Petroleum Liquid

- Turn off equipment, if it can be done safely
- Abandon all equipment and get a safe distance away.
- Avoid open flames or anything that might start a fire. Do not start motor vehicles or electrical equipment. Remove all ignition sources (cigarettes, cell phones, or anything that could create a spark or static electricity).
- Evacuate the area and keep people out.
- Do not make contact with escaping gas or liquid.
- Do not operate any pipeline valves.
- Call 911.
- Do not try to put out a fire. If it's burning, let it burn.
- Contact the facility operator immediately to report conditions.

13.7.7 Water/Sewer

- Evacuate the area immediately and keep people out. Leaking water can fill a trench quickly making escape extremely difficult.
- Do not close valves in order to stop flooding. Closing the wrong valves may affect fire flow and /or possible contamination of portable systems.
- Be careful of damaged high-pressure water lines because even the slightest scratch or vibration can cause pipelines to break.
- Move carefully around trenches with wet walls. Wet soil can easily cave in and cause suffocation.
- Avoid contact with wastewater. Do not wade in or work around wastewater.
- Sewer gas is flammable; avoid open flames or anything that might start a fire.
- Contact the facility operator immediately to report the condition.

13.8 Incident Reporting and Investigation

Any incident (other than minor first aid treatment) resulting in injury, illness or property damage requires an Incident investigation and report. The investigation should be conducted as soon as emergency conditions are under control. The purpose of the investigation is not to attribute blame but to determine the pertinent facts so that repeat or similar occurrences can be avoided. An AECOM Incident Investigation Form is presented in **Appendix E** of this HASP. The injured AECOM employee's supervisor, the AECOM PM, and the RSHM should be notified immediately of the injury.

13.9 Emergency Equipment/Facilities

All emergency alerting and response equipment shall be available at the interface of the support and Contamination Reduction Zone. At a minimum, this shall include the following:

- Air Horn
- First Aid Kit
- Fire Extinguisher (10 lb 2A:10B:10C)

- Site Telephone or cell phone
- Eye Wash (delivering a minimum of 0.4 gallons per minute ("gpm") for 15 minutes)
- Spill control supplies (absorbent pads, Speedy Dri, spill booms)

13.10 Occupational Clinic

Once employee report the injury to the SSO or PM, they should seek treatment for non-critical injuries; i.e. injuries of the First Aid variety at the occupational care clinic identified below.

Concentra Medical Center/Urgent Care
574 Summit Ave
4th Floor
Jersey City, NJ 07306
201-656-7678

A map and written directions to the Occupational Care Clinic must be developed for each site location. The route to the clinic shall be verified by the health and safety officer prior to the start of activities, and be familiar to all site personnel.

13.11 Hospital

The hospital in the Jersey City area that provides emergency care is identified below. If emergency medical service is called the medical responders will determine the appropriate hospital for treatment.

Jersey City Medical Center
101 Jersey Ave
Jersey City, NJ

A map and written directions to the hospital has been developed for each site location and is provided as **Appendix D**. The route to the hospital shall be verified by the health and safety officer prior to the start of activities, and be familiar to all site personnel.

13.12 Emergency Contacts

Emergency contact information is presented in **Table 13-1**.

Table 13-1 EMERGENCY CONTACTS

<i>Emergency Coordinators / Key Personnel</i>			
<u>Name</u>	<u>Title</u>	<u>Telephone Number</u>	<u>Cellular Phone</u>
Chris Martell	AECOM Project Manager	978-564-3633	732-529-5910

Task Hazard Analysis Form

S3NA-209-FM TASK HAZARD ANALYSIS

This THA (worksheets 1 & 2) must be completed for all field work.

***you may need to change the security settings in your task bar to enable the macros in the forms*

Hazard Identification

- **Natural (biological)** – bacteria, viruses, insects, plants, birds, and animals
- **Chemical** – exposure to chemical toxins, acute or chronic, by way of inhalation, injection, ingestion or absorption
- **Physical** – slipping/tripping, being struck by moving objects, repetitive movement, strains from lifting
- **Environmental** – extreme heat or cold, noise, vibrations, magnetic fields, pressure extremes and air quality
- **Psychosocial** – stress, violence

Hazard Classification

- Considers the potential severity of the outcome
- Considers the likelihood of the occurrence
- Used to prioritize and determine extent of required controls

Controls

- **Elimination (first)** – choose a different process; modify an existing process; substitute with less hazardous substance
- **Engineering Controls (second)** – physically alter the plant or equipment design in order to circumvent possible hazards; place guards on machinery
- **Administrative Controls (third)** – change the job procedure and/or process; limit the amount of time an individual is in a hazardous environment through job rotation
- **Personal Protective Equipment (last option)** – provide employees with direct physical protection while working in a hazardous environment

SIX QUESTIONS FOR SUCCESS – As your final preparedness take two minutes to think through and answer these questions:

1. What are we about to do?
2. What equipment are we going to use?
3. Have I/we been trained to use this equipment?
4. Have I/we been trained to do this job?
5. How can I/we be hurt?
6. How can I/we prevent this incident?

*If you and your team aren't prepared to do the assigned work, **STOP WORK**, and take time to properly prepare.*

END OF DAY SIGN-OFF:

3. Turn **right** at **Jersey Ave** 479 ft

B Jersey City Medical Center
101 Jersey Avenue
Jersey City, NJ 07302

Site History:

Site 114 - Chromate Production Facility

Site 114 is located at 70 Carteret Avenue in Jersey City, NJ. The western half of Site 114 was the location of a chromate production facility from 1924 to 1963. Products produced at the plant included aluminum hydrate, sodium chromate, sodium bichromate, sodium sulfate, vanadium pentoxide and potassium bichromate. In 1964, the chromate chemical production facility was dismantled.

The residue remaining after the leaching of the roast constituted the only waste produced at the chromate plant. This waste is referred to as “chromate ore processing residue” or COPR. Some COPR was recycled through the process, but the majority was stockpiled on the southeast corner of Site 114 and on adjacent PPG Site 137, or used as fill material to close the Morris Canal. In addition, some material was transported to other Hudson County sites and was used as fill for other purposes.

Site 114 - Manufactured Gas Plant (“MGP”)

Site 114 is located at 70 Carteret Avenue in Jersey City, NJ. The northeastern portion of Site 114 was the location of a manufactured gas plant (“MGP”) that operated from 1886 to the mid-1930s. The MGP used the coal gas process, the water gas process and the carbureted water gas process. The most likely wastes generated at the MGP included: ash, clinker, iron oxide sponge, coke, tar, pitch, drip oil, ammonium sulfate, sulfur, and ammonia liquor.

Hazard Assessment:

Site activities include construction management and environmental investigation and action activities. These activities include:

- Construction oversight
- Health and Safety oversight
- Engineering oversight
- Implementing the air monitoring plan
- Assisting in waste management/records management
- Environmental services
 - Oversight of the installation of soil borings, via direct-push and conventional drilling methods;
 - Physical characterization and sampling of soil samples from soil boring activities;
 - Soil boring installation also includes the oversight of non-mechanical excavation for utility clearance via soft dig (vactron/air knife) of at least the upper five (5) feet at soil boring locations;
 - Collection of environmental samples from soil, groundwater, air, surface water, waste, concrete and other matrices;
 - Conduct an air monitoring program for particulates, volatile organic compounds (VOCs) and other potential contaminants during all investigation activities.
 - Oversight of environmental test pits and environmental trenching which includes excavation, stock piling and backfilling material.
 - Conduct in-situ pilot tests and oversight of joint pilot tests conducted by other contracted consultants.
 - Oversight and direction of subcontractor installation and abandonment of temporary and permanent groundwater monitoring wells, including development of groundwater monitoring wells;

- Gauging, purging and sampling of groundwater monitoring wells;
- Geophysical and hydrologic testing of wells;
- Management of Investigative Derived Waste (“IDW”);
- Oversight and direction for surveying services;
- Physical interior and exterior property inspection by AECOM accompanied with the resident/owner looking for visual evidence of Chromate Chemical Production Waste (“CCPW”) impacts on the exterior of any structures as well as the interior of ground floor and basement or crawl space, if present.
- Oversight of the installation of interim remedial measures (“IRM”) and continued quarterly inspection and maintenance of all installed IRMs.
- Physical interior and exterior property inspection for the purpose of property acquisition.
- Conduct site walks and property inspections accompanied with the owner prior to implementing an environmental investigation on the property.

Physical Hazards

The primary physical hazards which may be encountered may include:

- Struck by motor vehicles, construction equipment or material handled,
- Slips trips and falls on the same level,
- Falls from elevations,
- Caught in/between,
- Underground and overhead utilities,
- Electrical hazards,
- Biological hazards,
- Noise Exposure, and
- Heat stress and cold stress.

Contaminates of Concern

The primary contaminant of concern is:

- Chromium and chromium byproducts

The secondary contaminants of concern include:

- Various metals (Vanadium, Antimony, Nickel, Arsenic) – associated with chromium production and historic fill;
- VOCs – associated with historic site and MGP facility operations;
- SVOCs – associated with historic site and MGP facility operations;
- PAHs – associated with historic fill;
- Pesticides – associated with historic site operations and fill;

PCBs – associated with historic site operations

Jersey City, NJ

Driving distance is approximately 1.7 miles; driving time is approximately 4 minutes

Site History

Site 132

Site 132 is located at 91 Carteret Avenue in Jersey City, NJ. On Site 132 (Town & Country Linen), an Interim Remedial Measures ("IRM") [pavement cover and fencing] were installed between 1990 and 1992. A Remedial Investigation Workplan was submitted to New Jersey Department of Environmental Protection ("NJDEP") in 2006, and remedial investigation fieldwork was completed in 2007. Hexavalent chromium was detected in soil at levels up to 20,900 milligrams per kilogram ("mg/kg") of hexavalent chromium. Total chromium was detected in site groundwater at levels up to 85 parts per billion ("ppb") for total chromium. The IRMs (pavement cover and fencing) are inspected on a quarterly basis. Site 132 is proposed to become part of the PPG Carteret South Project.

Hazard Assessment:

Site activities include construction management and environmental investigation and action activities. These activities include:

- Construction oversight

- Health and Safety oversight
- Engineering oversight
- Implementing the air monitoring plan
- Assisting in waste management/records management
- Environmental services
 - Oversight of the installation of soil borings, via direct-push and conventional drilling methods;
 - Physical characterization and sampling of soil samples from soil boring activities;
 - Soil boring installation also includes the oversight of non-mechanical excavation for utility clearance via soft dig (vactron/air knife) of at least the upper five (5) feet at soil boring locations;
 - Collection of environmental samples from soil, groundwater, air, surface water, waste, concrete and other matrices;
 - Conduct an air monitoring program for particulates, volatile organic compounds (VOCs) and other potential contaminants during all investigation activities.
 - Oversight of environmental test pits and environmental trenching which includes excavation, stock piling and backfilling material.
 - Conduct in-situ pilot tests and oversight of joint pilot tests conducted by other contracted consultants.
 - Oversight and direction of subcontractor installation and abandonment of temporary and permanent groundwater monitoring wells, including development of groundwater monitoring wells;
 - Gauging, purging and sampling of groundwater monitoring wells;
 - Geophysical and hydrologic testing of wells;
 - Management of Investigative Derived Waste (“IDW”);
 - Oversight and direction for surveying services;
 - Physical interior and exterior property inspection by AECOM accompanied with the resident/owner looking for visual evidence of Chromate Chemical Production Waste (“CCPW”) impacts on the exterior of any structures as well as the interior of ground floor and basement or crawl space, if present.
 - Oversight of the installation of interim remedial measures (“IRM”) and continued quarterly inspection and maintenance of all installed IRMs.
 - Physical interior and exterior property inspection for the purpose of property acquisition.
 - Conduct site walks and property inspections accompanied with the owner prior to implementing an environmental investigation on the property.

Physical Hazards

The primary physical hazards which may be encountered may include:

- Struck by motor vehicles, construction equipment or material handled,
- Slips trips and falls on the same level,
- Falls from elevations,
- Caught in/between,

- Underground and overhead utilities,
- Electrical hazards,
- Biological hazards,
- Noise Exposure, and
- Heat stress and cold stress.

Contaminates of Concern

The primary contaminant of concern is:

- Chromium and chromium byproducts

The secondary contaminants of concern include:

- Various metals (Vanadium, Antimony, Nickel, Arsenic) – associated with chromium production and historic fill;
- VOCs – associated with historic site and MGP facility operations;
- SVOCs – associated with historic site and MGP facility operations;
- PAHs – associated with historic fill;
- Pesticides – associated with historic site operations and fill;

Site History

Site 133

Site 133 includes 15 Halladay Street and 2-72 Halladay Street in Jersey City, NJ. On Site 133 (Ross Wax), an IRM [interior wall and floor coverings and exterior pavement] were installed in 1991. A Remedial Investigation Workplan was submitted to NJDEP in 2006, and remedial investigation fieldwork was completed in 2007. Hexavalent chromium was detected in site soil at levels up to 11,900 mg/kg of hexavalent chromium. Total chromium was detected in site groundwater at levels up to 7,000 ppb total chromium in the adjacent right-of-way. The interior and exterior IRMs at Site 133 are inspected on a quarterly basis. 15 Halladay was part of the due diligence investigation conducted in early 2012.

Hazard Assessment:

Site activities include construction management and environmental investigation and action activities. These activities include:

- Construction oversight
- Health and Safety oversight
- Engineering oversight
- Implementing the air monitoring plan
- Assisting in waste management/records management
- Environmental services
 - Oversight of the installation of soil borings, via direct-push and conventional drilling methods;
 - Physical characterization and sampling of soil samples from soil boring activities;
 - Soil boring installation also includes the oversight of non-mechanical excavation for utility clearance via soft dig (vactron/air knife) of at least the upper five (5) feet at soil boring locations;
 - Collection of environmental samples from soil, groundwater, air, surface water, waste, concrete and other matrices;
 - Conduct an air monitoring program for particulates, volatile organic compounds (VOCs) and other potential contaminants during all investigation activities.
 - Oversight of environmental test pits and environmental trenching which includes excavation, stock piling and backfilling material.
 - Conduct in-situ pilot tests and oversight of joint pilot tests conducted by other contracted consultants.
 - Oversight and direction of subcontractor installation and abandonment of temporary and permanent groundwater monitoring wells, including development of groundwater monitoring wells;
 - Gauging, purging and sampling of groundwater monitoring wells;
 - Geophysical and hydrologic testing of wells;
 - Management of Investigative Derived Waste ("IDW");
 - Oversight and direction for surveying services;
 - Physical interior and exterior property inspection by AECOM accompanied with the resident/owner looking for visual evidence of Chromate Chemical Production Waste ("CCPW") impacts on the exterior of any structures as well as the interior of ground floor and basement or crawl space, if present.
 - Oversight of the installation of interim remedial measures ("IRM") and continued quarterly inspection and maintenance of all installed IRMs.
 - Physical interior and exterior property inspection for the purpose of property acquisition.
 - Conduct site walks and property inspections accompanied with the owner prior to implementing an environmental investigation on the property.

Physical Hazards

The primary physical hazards which may be encountered may include:

- Struck by motor vehicles, construction equipment or material handled,

- Slips trips and falls on the same level,
- Falls from elevations,
- Caught in/between,
- Underground and overhead utilities,
- Electrical hazards,
- Biological hazards,
- Noise Exposure, and
- Heat stress and cold stress.

Contaminates of Concern

The primary contaminant of concern is:

- Chromium and chromium byproducts

The secondary contaminants of concern include:

- Various metals (Vanadium, Antimony, Nickel, Arsenic) – associated with chromium production and historic fill;
- VOCs – associated with historic site and MGP facility operations;
- SVOCs – associated with historic site and MGP facility operations;
- PAHs – associated with historic fill;
- Pesticides – associated with historic site operations and fill;

PCBs – associated with historic site operations

Site History

Site 135

Site 135 is located from 51-99 Pacific Avenue in Jersey City, NJ. On Site 135 (Vitarroz), a Remedial Investigation Workplan was submitted to NJDEP in 2006, and remedial investigation fieldwork was completed in 2007. Hexavalent chromium was detected in site soil at levels up to 20 mg/kg of hexavalent chromium. On Site 135, hexavalent chromium was detected at 20.1 mg/kg in only one sample (PPG-135-MW1C). Total chromium was detected in site groundwater at levels up to 114 ppb for total chromium.

Hazard Assessment:

Site activities include construction management and environmental investigation and action activities. These activities include:

- Construction oversight
- Health and Safety oversight
- Engineering oversight
- Implementing the air monitoring plan
- Assisting in waste management/records management
- Environmental services
 - Oversight of the installation of soil borings, via direct-push and conventional drilling methods;

Site History

Site 137

Site 137 is located at 25 Halladay Street and 45 Halladay Street in Jersey City, NJ. On Site 137 (Rudolf Bass) at 45 Halladay Street, IRM [interior wall and floor coverings; and exterior pavement] were installed between 1990 and 1992. A Remedial Investigation Workplan was submitted to NJDEP in 2006, and remedial investigation fieldwork was completed in 2007. Hexavalent chromium was detected in site soil at levels up to 29,300 mg/kg of hexavalent chromium. Total chromium was detected in site groundwater at levels up to 19,000 ppb for total chromium.

On Site 137 (Rudolf Bass) at 25 Halladay Street, a Remedial Investigation Workplan was submitted to NJDEP in 2006, and remedial investigation fieldwork was completed in 2007. The property has a building on it and is presently being used for light industrial purposes. Hexavalent chromium was detected in site soil at levels up

to 26,000 mg/kg of hexavalent chromium. Total chromium was detected in site groundwater at levels up to 5,300 ppb for total chromium. Interim remedial measures were implemented at Site 137 and engineering controls have been installed within the building interior and exterior to address observed chromium impacted surfaces. The IRMs are inspected on a quarterly basis. 25 Halladay was part of the due diligence investigation conducted in early 2012.

Hazard Assessment:

Site activities include construction management and environmental investigation and action activities. These activities include:

- Construction oversight
- Health and Safety oversight
- Engineering oversight
- Implementing the air monitoring plan
- Assisting in waste management/records management
- Environmental services
 - Oversight of the installation of soil borings, via direct-push and conventional drilling methods;

Site History

Site 143

Site 143 is located at 846 Garfield Avenue in Jersey City, NJ. On Site 143 (Talarico Auto), an IRM (exterior covering) was installed between 1990 and 1992. A Remedial Investigation Workplan was submitted to NJDEP in 2006, and remedial investigation fieldwork was completed in 2007. Hexavalent chromium was detected in site soil at levels up to 1,530 mg/kg of hexavalent chromium. Total chromium was detected in site groundwater in the adjacent right of way at levels up to 25,000 ppb for total chromium. Site 143 was part of the due diligence investigation conducted in late 2011.

Hazard Assessment:

Site activities include construction management and environmental investigation and action activities. These activities include:

- Construction oversight
- Health and Safety oversight
- Engineering oversight
- Implementing the air monitoring plan
- Assisting in waste management/records management
- Environmental services
 - Oversight of the installation of soil borings, via direct-push and conventional drilling methods;
 - Physical characterization and sampling of soil samples from soil boring activities;
 - Soil boring installation also includes the oversight of non-mechanical excavation for utility clearance via soft dig (vactron/air knife) of at least the upper five (5) feet at soil boring locations;

AECOM SH&E SOPs

S3NA-209-PR Project Hazard Assessment and Planning

1.0 Purpose and Scope

- 1.1 AECOM and its employees must assess all projects and sites for anticipated hazards and plan to mitigate those hazards through a series of controls. This procedure establishes the requirements and provides the tools for this process of pre-work planning and risk assessment.
- 1.2 The objective is to enhance SH&E performance, to reduce losses due to injury, illness, property damage, or environmental impairment incident, and maintain regulatory compliance.
- 1.3 This procedure applies to all AECOM North America based employees and operations.

2.0 Terms and Definitions

- 2.1 **Task Hazard Analysis (THA):** A THA (*S3NA-209-FM Task Hazard Analysis*) is a technique for evaluating the component parts of any work method or procedure for the purpose of:
 - 2.1.1 Identifying the SH&E hazards and risks connected with the work;
 - 2.1.2 Identifying and implementing control methods to eliminate, nullify, or reduce to a minimum the consequences of such hazards and risks; and,
 - 2.1.3 Evaluating the effectiveness of risk control measures and making modifications as needed.
- 2.2 **Plan:** A comprehensive document which outlines at length, in a report-style format, all of the operational controls necessary to mitigate the anticipated hazards for a project's sites and activities. AECOM will use two established planning templates:
 - 2.2.1 Health and Safety Plan (HASP) for work involving environmental contaminants (e.g., HAZWOPER), or
 - 2.2.2 Safe Work Plan (SWP) for all other SH&E planning documentation.
- 2.3 **High Risk Classification:** Any task where the identified hazard, if further controls are not implemented, has a combined severity and probability that is either catastrophic or very likely, or some combination thereof (but where the result is not minor or rare). (Refer to *S3NA-209-WI Hazard Identification, Classification and Controls* for further details.) The following may be classified as High Risk; consult the SH&E Department for clarification:
 - 2.3.1 Confined space,
 - 2.3.2 HAZWOPER,
 - 2.3.3 Contaminated sites,
 - 2.3.4 Radiation,
 - 2.3.5 Lead,
 - 2.3.6 Asbestos,
 - 2.3.7 AECOM camp or construction sites,
 - 2.3.8 Competent person requirements,
 - 2.3.9 Sites with potential for client system failures,
 - 2.3.10 Significant physical hazards (e.g., fall, water, equipment, etc.),
 - 2.3.11 Munitions and Explosives of Concern / Unexploded Ordnance (MEC-UXO) Ops
 - 2.3.12 Potential for significant environmental incident, or
 - 2.3.13 Sites with medical surveillance requirements.

3.0 Attachments

- 3.1 S3NA-209-FM Task Hazard Analysis
- 3.2 S3NA-209-WI Hazard Identification, Classification and Controls
- 3.3 S3NA-209-TP1 Safe Work Plan
- 3.4 S3NA-209-TP2 Health and Safety Plan Template
- 3.5 S3NA-209-TP2a HASP Assistant
- 3.6 S3NA (US)-209-TP2b HASP Chemical Guidelines

4.0 Procedure

4.1 Roles & Responsibilities

4.1.1 SH&E Department responsibilities include the following:

- Assisting project management personnel to identify any necessary project-specific SH&E planning documentation required for all new and ongoing projects.
- Assisting in the preparation of necessary SH&E planning documentation.
- Reviewing and approving all SH&E planning documentation prior to its implementation for field activities.

4.1.2 Project Manager (or their designee) responsibilities include the following:

- Confirming the completion of SH&E planning documentation (THA, SWP or HASP), as required, that addresses the full range of project activities, safety risks and that all requirements and procedures are implemented and enforced during the field activities.
- Confirming SH&E requirements and Standard Operating Procedures are implemented successfully, including but not limited to:
 - Subcontractor evaluations
 - SH&E Training
 - Personal Protective Equipment
 - First aid and emergency response
 - Client requirements
- Contacting the SH&E Department to discuss SH&E planning documentation needs/ requirements at the start of each new project involving AECOM and at designated intervals (not to exceed one year) or when changes occur to the work operations or work location/ conditions, when work activities are modified/ changed, or when additional tasks are added to the work scope.
- Confirming that all SH&E planning documentation (draft or final) has been reviewed and approved by the **SH&E Department** prior to its use by AECOM personnel, or prior to release to outside agencies or organizations.
- Making appropriate resources available to protect the health and safety of AECOM employees, the environment and to comply with occupational health and safety, and environmental legislation and for the effective implementation of this procedure.

4.1.3 Employee responsibilities include the following:

- Participating in hazard identification training at the commencement of their employment with AECOM or prior to commencing field preparations.
- Reviewing and understanding the potential hazards and controls of the project before work commences.
- Complying with all required controls as identified in the THA and/or associated safety plans.

4.2 Procedure

4.2.1 All projects must have a completed Task Hazard Analysis at a minimum. In addition, all field projects must have an Emergency Response Plan. These two documents may be all a project needs for administrative safety requirements, depending on the hazards identified.

4.2.2 The table below helps illustrate the further planning documentation which may be required, depending on the hazards identified in the THA.

Task Hazard Analysis	<ul style="list-style-type: none"> Most basic requirement All sites and tasks including walk-through site visits 	<ul style="list-style-type: none"> Prepared by employees/supervisors Confirmed by Project Manager or designee
Safe Work Plan (SWP)	<ul style="list-style-type: none"> High risk activities Complex projects with multiple stakeholders, long-duration AECOM controlled sites Non-HAZWOPER 	<ul style="list-style-type: none"> SH&E Department review and guidance required
Health & Safety Plan (HASP)	<ul style="list-style-type: none"> HAZWOPER regulated sites and all other sites with potential chemical exposures Client directed 	<ul style="list-style-type: none"> Only for sites with potential chemical exposures and Hazardous Waste Operations and Emergency Response (HAZWOPER) SH&E Department review and guidance required

4.3 Task Hazard Analysis (THA)

4.3.1 A THA must be completed for all (routine and non-routine) tasks and sites.

4.3.2 A THA must be completed prior to the commencement of work so that all controls can be planned, equipment purchased/inspected, and staff adequately trained for the hazards.

4.3.3 The THA must identify all known and potential physical hazards as well as potential occupational exposures for noise, biological, or chemical contaminants, and environmental issues.

4.3.4 The assessment must include the identification and implementation of control measures to prevent worker injury, exposure and contamination.

4.3.5 Hazard identification and risk assessment must be ongoing. This requires the project team to consider the timing and frequency of the THA reviews, as affected by the following types of issues:

- The need to determine whether existing risk controls are effective and adequate,
- The need to respond to new hazards,
- The need to respond to changes that AECOM itself has made,
- The need to respond to feedback from monitoring activities, incident investigation, emergency situations or the results of testing of emergency procedures,
- Changes in legislation,
- External factors, e.g. emerging occupational health issues,
- Advances in control technologies,
- Changing diversity in the workforce, including contractors, or
- Changes proposed by corrective and preventive action.

4.3.6 THAs will be prepared by the supervisor and employee(s) directly responsible for the work.

4.3.7 Final drafts shall be submitted for review and approved by the **Project Manager** prior to commencing work activities.

4.3.8 AECOM subcontractors will prepare their own THA and submit them to the **Project Manager** for review and acceptance prior to the start of subcontracted work activities. These reviews are not approvals, and do not relieve the subcontractor for being responsible for their own safety on the project site.

- 4.3.9 The **Project Manager** shall maintain all approved/signed THA copies (including revisions) in the project files and make them available during project audits and for use during the training of new project personnel.
- 4.3.10 THAs shall be used to facilitate project SH&E tailgate meetings. Comments and suggestions relative to the completed THA shall be encouraged from attendees and incorporated into revised documents. Any modifications must be reviewed as corrective measures to confirm that no new hazards are created.
- 4.3.11 THAs that have been found to be inadequate or incomplete should be suitably annotated by the project management team to be used as lessons learned.
- 4.3.12 The THA will be reviewed by all personnel involved in the task, as well as any visitors or additional or new crews brought on to perform the work. This is a minimum of a one-time review and signature with supplement reviews conducted on a pre-determined basis by the **Project Manager** or their designee.
- 4.4 **Planning Documents**
- 4.4.1 An SH&E plan (in addition to the THA) may be required in the following circumstances:
- Tasks with high risk classification designations,
 - Tasks with medium risk classification designations, where circumstances warrant, and/or
 - Complex AECOM controlled projects where it is necessary to communicate to numerous stakeholders and clearly define all controls including emergency response, incident reporting, inspections, security requirements, or other details.
- 4.4.2 The planning document shall be titled a Safe Work Plan UNLESS it involves Hazardous Waste Operations and Emergency Response (HAZWOPER) requirements, then it will be called a Health and Safety Plan (HASP) and will clearly address the specific requirements associated with the hazardous waste exposures.
- 4.4.3 Specific plan needs will vary for each project. In some cases it may be acceptable to utilize general (non-site/non-project-specific) SH&E procedural documentation prepared for the type of work activities being performed, while in others project/site/activity-specific documentation is required to be developed as part of the project planning process. The specific operational needs of individual projects will be determined as part of the initial coordination between the **Project Manager** and the **SH&E Department**.
- 4.4.4 The following requirements apply to all AECOM SH&E planning documentation:
- Preparation of the SH&E documentation can be performed by a member of the project team or the **SH&E Department**.
 - All SH&E documentation (including draft versions of documents) will be approved by the **SH&E Department** prior to release for outside agency review (e.g., clients, regulatory agencies, etc) and prior to its field implementation.
 - All changes to approved SH&E documentation require concurrence from a designated member of the **SH&E Department**. This includes those made in response to changing field conditions or operational requirements and those made in response to regulator/client comments. Any written responses made to regulator/client comments also must be reviewed and approved by the **SH&E Department**.
 - The SH&E documentation for any project lasting twelve (12) months or longer will be reviewed at periodic intervals determined by the **SH&E Department**, but at least annually. The SH&E Representative will review the changes and determine whether modifications are required to the existing SH&E planning documentation. This confirms that the documentation continues to reflect the current project scope and knowledge of site conditions, and that any revised regulatory requirements are properly addressed. The **Project Manager** will provide a master copy of the SH&E documentation to be maintained on site for reference by personnel, together with copies of any required SH&E-related records or operational documentation. The master copy must be current in all respects, and will include any changes or modifications made as work progresses.
 - **Project Managers** will confirm that ALL plans and THAs have been reviewed with project personnel prior to implementation of field work. Sign-off and concurrence is mandatory and to be kept in the project records.

5.0 Records

- 5.1 Completed THAs, SWPs, and HASPs will be filed in their appropriate project file.

6.0 References

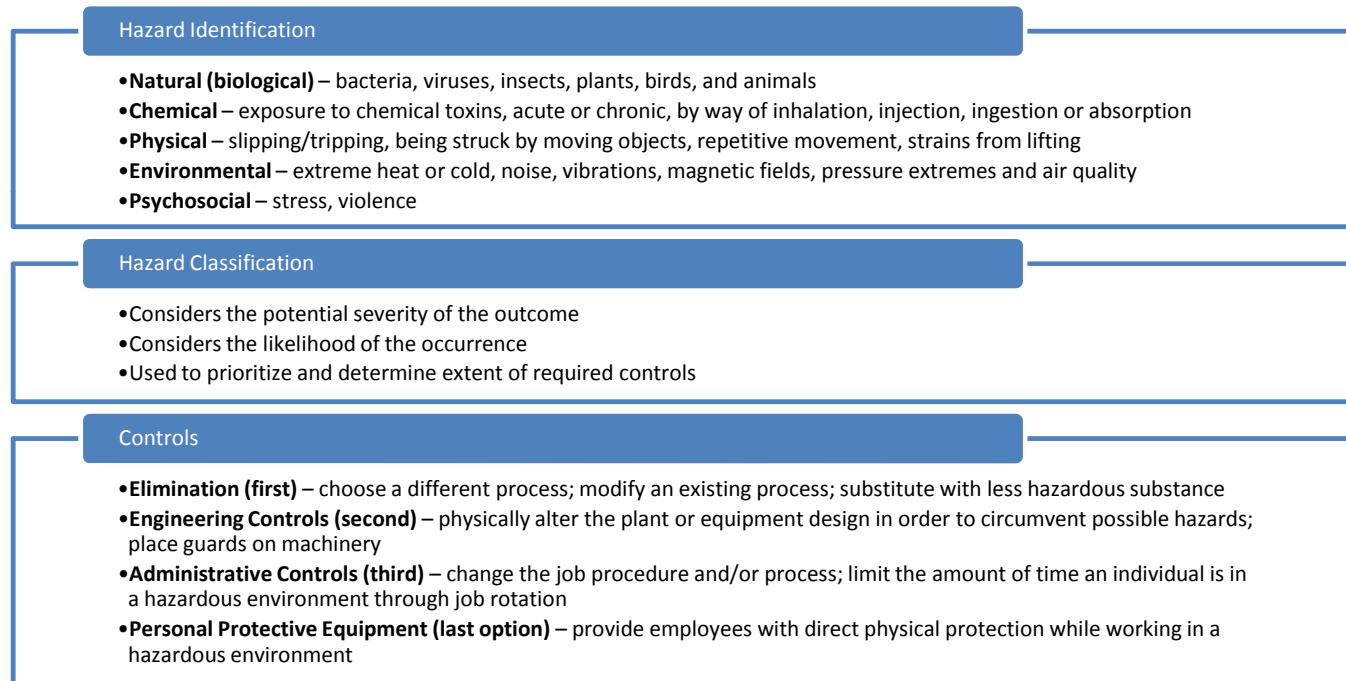

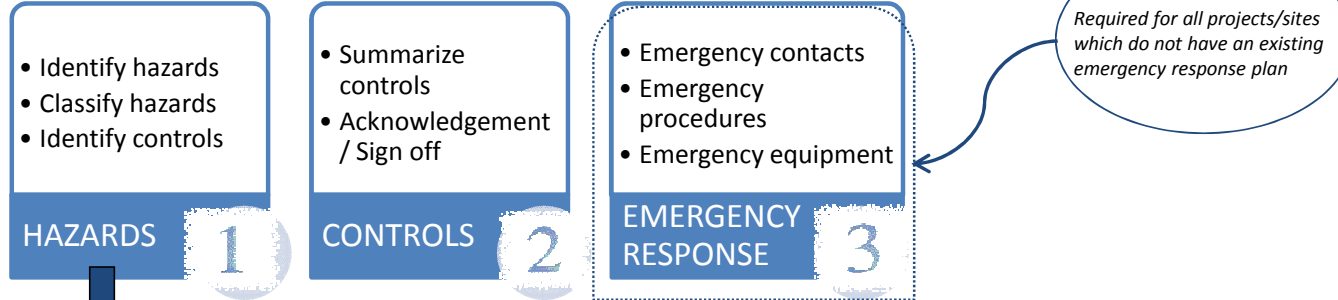

- 6.1 None

S3NA-209-WI Hazard Identification, Classification & Controls

The following information is intended to guide staff in completing the Task Hazard Analysis.

1.0 Hazard Identification

- 1.1 Hazards occurring in the workplace may be:
 - 1.1.1 Natural (biological) – bacteria, viruses, insects, plants, birds, and animals
 - 1.1.2 Chemical – exposure to chemical toxins, acute or chronic, by way of inhalation, ingestion or absorption
 - 1.1.3 Physical – slipping/tripping, being struck by moving objects, repetitive movement, strains from lifting
 - 1.1.4 Environmental – extreme heat or cold, noise, vibrations, magnetic fields, pressure extremes and air quality
 - 1.1.5 Psychosocial – stress, violence
- 1.2 When identifying hazards, remember to consider the following:
 - 1.2.1 Routine and non-routine activities;
 - 1.2.2 Activities of all persons having access to the workplace (including contractors and visitors);
 - 1.2.3 Human behavior, capabilities and other human factors;
 - 1.2.4 Identified hazards originating outside the workplace capable of adversely affecting the health and safety of persons under the control of AECOM;
 - 1.2.5 Hazards created in the vicinity of the workplace by work-related activities under the control of AECOM;
 - 1.2.6 Infrastructure, equipment and materials at the workplace, whether provided by AECOM or others;
 - 1.2.7 Changes or proposed changes within AECOM;
 - 1.2.8 Modifications to the OH&S management system, including temporary changes, and their impacts on operations, processes, and activities;
 - 1.2.9 Any applicable legal obligations relating to risk assessment and implementation of necessary controls;
 - 1.2.10 The design of work areas, processes, installations, machinery/equipment, operating procedures and work organization, including their adaptation to human capabilities.
- 1.3 It is often useful to break the job or task down into a sequence of steps (“Job Event Sequence”) to help identify the primary hazards which may be encountered when you complete a job task. The “events” identified should be only as detailed as required to identify the primary hazards (e.g., drive to worksite; inspect bridge decking; take water samples, etc.)

2.0 Hazard Classification

Once identified, all hazards should be classified based on both their potential outcome and the probability of its occurrence as follows:

2.1 Severity

- 2.1.1 Insignificant – no injuries, low environmental/financial impact = 1
- 2.1.2 Minor – first aid required, some environmental/financial impact = 2
- 2.1.3 Moderate – medical treatment required, contained environmental impact, high cost = 3
- 2.1.4 Major – serious injury, severe environmental damage, major cost = 4
- 2.1.5 Catastrophic – death, environmental disaster, extensive damage, extended downtime for company or site, huge cost = 5
- 2.1.6 Likely – Likelihood of incident occurring sometime during the work activity = 4
- 2.1.7 Very Likely – Likelihood of incident happening often during course of the work activity = 5

- 2.2 High Hazard – Practice or condition whose sum of severity and probability is greater than or equal to 8.
- 2.3 Medium Hazard – Practice or condition whose sum of severity and probability is equal to either 6 or 7.
- 2.4 Low Hazard – Practice or condition whose sum of severity and probability is less than or equal to 5.
- 2.5 Inputs to the hazard classification can include, but are not be limited to, information or data on the following:
 - 2.5.1 Details of location(s) where work is carried out,
 - 2.5.2 The proximity and scope for hazardous interaction between activities in the workplace,
 - 2.5.3 Security arrangements,
 - 2.5.4 The human capabilities, behavior, competence, training and experience of those who normally and/or occasionally carry out hazardous tasks,
 - 2.5.5 Toxicological data, epidemiological data and other health related information,
 - 2.5.6 The proximity of other personnel (e.g. cleaners, visitors, contractors, the public) who might be affected by hazardous work,
 - 2.5.7 Details of any work instructions, systems of work and/or permit-to-work procedures, prepared for hazardous tasks,
 - 2.5.8 Manufacturers' or suppliers' instructions for operation and maintenance of equipment and facilities,
 - 2.5.9 The availability and use of control measures (e.g. for ventilation, guarding, personal protective equipment (PPE), etc.),
 - 2.5.10 Abnormal conditions (e.g. the potential interruption of utility services such as electricity and water, or other process failures),
 - 2.5.11 Environmental conditions affecting the workplace,
 - 2.5.12 The potential for failure of plant and machinery components and safety devices or for their degradation from exposure to the elements or process materials,
 - 2.5.13 Details of access to, and adequacy/condition of emergency procedures, emergency escape plans, emergency equipment, emergency escape routes (including signage), emergency communication facilities, and external emergency support, etc.,
 - 2.5.14 Monitoring data related to incidents associated with specific work activities,
 - 2.5.15 The findings of any existing assessments relating to hazardous work activity,
 - 2.5.16 Details of previous unsafe acts either by the individuals performing the activity or by others (e.g. adjacent personnel, visitors, contractors, etc.),
 - 2.5.17 The potential for a failure to induce associated failures or disabling of control measures,
 - 2.5.18 The duration and frequency at which tasks are carried out,
 - 2.5.19 The accuracy and reliability of the data available for the risk assessment,
 - 2.5.20 Any legal and other requirements which prescribe how the risk assessment has to be performed or what constitutes an acceptable risk, e.g. sampling methods to determine exposure,
 - 2.5.21 Use of specific risk assessment methods, or permissible exposure levels.
- 2.6 Considering all of the hazards associated with the job task, provide an overall classification for the job/task in the Task Hazard Analysis. This classification can be used as a guideline for prioritizing and determining the level and number of controls required.
- 2.7 In considering the hazard, there are numerous tools to help you classify the risk of an incident. The hazard classification matrix, below, is one such tool:

Hazard classification matrix

Severity	Probability					
		Very Likely	Likely	Possibly	Rarely	Unlikely
		5	4	3	2	1
Catastrophic (death, environmental disaster, extensive damage, extended downtime for company or site, huge cost)	5	10	9	8	7	6
Major (serious injury, severe environmental damage, major cost)	4	9	8	7	6	5
Moderate (medical treatment required, contained environmental impact, high cost)	3	8	7	6	5	4
Minor (First aid required, some environmental/financial impact)	2	7	6	5	4	3
Insignificant (no injuries, low environmental/financial impact)	1	6	5	4	3	2

Probability: How likely is it to happen?

Very Likely	Likelihood of incident happening often during course of the work activity
Likely	Likelihood of incident occurring sometime during the work activity
Possibly	Possibility of incident occurring sometime during the work activity
Rarely	Incident will rarely occur during the work activity
Unlikely	Incident will probably not occur during the work activity

Hazard Classification:

	HIGH
	MED
	LOW

3.0 Hazard Control

Once identified and classified, all hazards must have an effective means of control which can be accomplished by using one or more of the following means of control:

3.1 Elimination/Removal (first)

- 3.1.1 Choose a different process
- 3.1.2 Modify an existing process
- 3.1.3 Substitute with less hazardous substance

3.2 Engineering Controls (second)

- 3.2.1 Physically alter the plant or equipment design in order to circumvent possible hazards
- 3.2.2 Place guards on machinery
- 3.2.3 Construct catwalks to divert traffic from hazardous areas

3.3 Administrative Controls (third)

- 3.3.1 Affect the job procedure and/or process in order to reduce hazards

3.3.2 Implement rules to change unsafe behaviors

3.3.3 Limit the amount of time an individual is in a hazardous environment through job rotation

3.4 Personal Protective Equipment (fourth)

3.4.1 Provide employees with direct physical protection while working in a hazardous environment

3.5 All identified hazards must have an effective means of control to minimize the potential for an incident; however, hazards with higher classifications should be addressed first and will undoubtedly require a variety of the types of controls mentioned above.

EXECUTIVE SUMMARY

The purpose of this Safe Work Plan (SWP) is to address health and safety concerns related to AECOM-managed activities at the [site name] site, located at [site address] in [city, state]. The specific roles, responsibilities, authority, and requirements as they pertain to the safety of employees and the scope of services are discussed herein. The document is intended to identify known potential hazards and to facilitate communication and control measures to prevent injury or harm. Additionally, provisions to control the potential for environmental impact from these activities are included where applicable.

[Insert brief scope of services and responsible party]

AECOM will be...

Subcontractor X will be...

Subcontractor Y will be...

The primary physical hazards that may be encountered include:

[list PRIMARY physical hazards]

The chemical hazards that may be encountered include:

[list anticipated chemical hazards]

All staff are bound by the provisions of this SWP and are required to participate in a preliminary project safety meeting to familiarize them with the anticipated hazards and respective onsite controls. The discussion will cover the entire SWP subject matter, putting emphasis on critical elements of the plan; such as the emergency response procedures, personal protective equipment, site control strategies, and monitoring requirements. In addition, daily tailgate safety meetings will be held to discuss the anticipated scope of work, required controls, incident reporting, and any lessons learned or concerns from the previous day; to identify new hazards and controls; and to review the results of inspections.

Attachment C	Client Required Health and Safety Guidelines

1.0 INTRODUCTION

This Safe Work Plan (SWP) addresses the requirements for AECOM and subcontractor personnel to conduct field activities to support the [Project Name, Scope of Work, and Location].

The requirements of this SWP apply to AECOM-managed operations only. No change to this SWP that could affect the health or safety of personnel, the community, or the environment may be made without prior approval of the AECOM Project Manager (PM) and the Safety, Health, and Environmental (SH&E) Professional.

1.1 Classification of Activities

- 1.1.1 The work activities addressed in this SWP are [describe the planned services] and do not meet the requirements for characterization as hazardous waste operations or emergency response (HAZWOPER) activities as defined in *S3NA-509-PR Hazardous Waste Operations and Emergency Response*.

1.2 Regulatory Requirements

- 1.2.1 This SWP meets the requirements and follows the OH&S legislative requirements in Canada and the guidelines established by the Federal Occupational Safety and Health Administration (OSHA):
- Code of Federal Regulation Title 29, Part 1910 (29 CFR Part 1910), Occupational Safety and Health Standards
 - Code of Federal Regulation Title 29, Part 1926 (29 CFR Part 1926), Safety and Health Regulations for Construction
 - [insert state or other requirements]
- 1.2.2 The requirements specified in this SWP also conform to AECOM's Corporate SH&E Program requirements as specified in AECOM's North America Operations SH&E Manual. Individual Standard Operating Procedures (SOPs) from this manual that are applicable to the work activities planned during this project may be found in Attachment B.
- ### 1.3 Project Safety and Health Organization
- 1.3.1 Project Manager [Insert Name, if available]
- 1.3.2 The Project Manager (PM) has overall management authority and responsibility for all site operations, including safety. The PM will provide the **site supervisor** with work plans, staff, and budgetary resources that are appropriate to meet the safety needs of the project operations.
- 1.3.3 Site Supervisor [Insert Name, if available]
- 1.3.4 The site supervisor has the overall responsibility and authority to direct work operations at the job site according to the provided work plans. The **PM** may act as the **site supervisor** while on site.
- 1.3.4.1 RESPONSIBILITIES
- The site supervisor is responsible for:
- Discussing deviations from the work plan with the SSO and PM.
 - Discussing safety issues with the PM, SSO, and field personnel.
 - Assisting the SSO with the development and implementation of corrective actions for site safety deficiencies.
 - Assisting the SSO with the implementation of this SWP and with ensuring compliance.
 - Assisting the SSO with inspections of the site for compliance with this SWP and applicable SOPs.

1.3.4.2 Authority

The site supervisor has authority to:

- Verify that all operations are in compliance with the requirements of this SWP and halt any activity that poses a potential hazard to personnel, property, or the environment.
- Temporarily suspend individuals from field activities for infractions against the SWP pending consideration by the SSO, the Safety Professional, and the PM.

1.3.5 Employees

1.3.5.1 Employee Responsibilities

Responsibilities of employees associated with this project include, but are not limited to:

- Understanding and abiding by the policies and procedures specified in the SWP and other applicable safety policies, and clarifying those areas where understanding is incomplete.
- Providing feedback to health and safety management relating to omissions and modifications in the SWP or other safety policies.
- Notifying the SSO, in writing, of unsafe conditions and acts.

1.3.5.2 Employee Authority

The safety and health authority of each employee assigned to the site includes the following:

- The right to refuse to work and/or stop work authority when the employee feels that the work is unsafe (including subcontractors or team contractors), or where specified safety precautions are not adequate or fully understood.
- The right to refuse to work on any site or operation where the safety procedures specified in this SWP or other safety policies are not being followed.
- The right to contact the SSO or the Safety Professional at any time to discuss potential concerns.
- The right and duty to stop work when conditions are unsafe, and to assist in correcting these conditions.

2.0 SITE DESCRIPTION AND PLANNED WORK OPERATIONS

2.1 General Description

The [site name] site is located at [site address]. [Insert description. This should include any *significant* physical features of the site (i.e., terrain, buildings, size, location, bodies of water etc.)].

2.2 Planned Work Operations

[Provide a verbal description of the overall objective for what is being done for the job and what is supposed to be accomplished. This does not have to actually spell out the steps for the job, as that will be covered in the bullets below.]

- [Provide a bulleted list of the tasks that will be accomplished throughout the job]

3.0 HAZARD ASSESSMENT

3.1 Physical Hazards

[Discuss the specifics of hazards that will/may be encountered, like haz noise, heavy equip. etc... Limit the discussion to the scope and magnitude of the hazard on this job, don't discuss hazard control.]

See SWP Description and Assistance document for examples

3.2 Wildlife, Plant and Insect Hazards

Below is a series of tasks typically encountered on projects. While the text below may be used to describe your work, it must be elaborated on and sufficient detail included making it site specific.

See SWP Description and Assistance document for examples

3.3 Radiological Hazards

[Discuss any on-site radioactive materials that are environmental contaminants (ignore RAM in devices, etc. that we bring to site].

3.4 Ultraviolet Hazards

[The 2009 historical UV Index for the (Insert City here) area showed that worker's UV exposures were in the HIGH category beginning in March and lasting until November with worker's exposures in the EXTREME category from July through August. In 2009, (City Name) had 44 days in the HIGH category, 133 days in the VERY HIGH category, and 0 days in the EXTREME category. Workers performing field work outdoors may be susceptible to sunburn if not properly protected with sunscreen or protective clothing and hats. Skin can burn in minutes when the UV Index is VERY HIGH.] Protective measures are advisable.

3.5 Weather Hazards

The Site Safety Officer will be attentive to daily weather forecasts for the project area each morning. Predicted weather conditions of potential field impact are to be included in safety briefings and the Task Hazard Analysis (THA) for that day. Weather changes should initiate a review and updates (THA) as necessary.

Severe weather can occur with little warning. Employees will be vigilant for the potentials for storms, lightning, high winds, and flash flood events.

3.6 Other Hazards

[Address anything not already covered that might be significant, like UXO. Don't provide control procedures here (that's for Section 5.0), just discuss what's there and what it can do].

3.7 Hazard Analysis

Task Hazard Analyses (THAs) have been completed for all tasks identified in the Scope of Work (Attachment A):

[List all Tasks which have been addressed in THAs]

Unanticipated Work Activities/Conditions

As a result of unanticipated work activities or changing conditions, additional THAs may be required. All additional THAs will be reviewed and approved by the SH&E Professional.

3.8 Task-Specific SH&E Procedures

Personnel may be exposed to a variety of chemical, physical, and radiological hazards resulting from task or equipment-specific activities. The controls for many of these hazards are discussed in SOPs found in the **Series 300 to 500** of the North America SH&E SOPs.

SOP#	TITLE	SOP#	TITLE
S3NA 300 Series Field (Common)		S3NA 500 Series Industrial Hygiene

4.0 HEALTH AND SAFETY REQUIREMENTS

4.1 Site-Specific Safety Training

All AECOM personnel performing activities at the site will be trained in accordance with *S3NA-003-PR SH&E Training*. All personnel are required to remain current in all of their required training and evaluate their need for additional training when there is a change in work. In addition to the general health and safety training programs, personnel will be required to complete any supplemental task specific training developed for the tasks to be performed. Administration and compliance with the requirements for additional task-specific training will be the responsibility of the project or lead manager. Any additional required training that is completed will be documented and tracked in the project files.

4.2 Competent Person Training Requirements

In order to complete the planned scope of work, an (OSHA or OH&S conformance) competent person must be designated to perform the required daily on site inspections of operations and/or equipment. The competent person may be an AECOM (if responsible for supervising that activity) or the subcontractor's employee. Designated competent person(s) for this project are shown in Table 4-2:

Table 4-2: Task-Specific Competent Persons

Employee Name	Organization	Area of Competency
		[insert other requirements or delete rows]

Note: The training requirements for competent persons are specified in the indicated SOPs and/or *S3NA-202-PR Competent Person Designation*. By identifying an employee as a "competent person", that person has now been authorized to take prompt corrective measures to eliminate hazards.

4.3 Tailgate Meetings

Prior to the commencement of daily project activities, a tailgate meeting will be conducted by the SSO to review the specific requirements of this SWP, applicable THA. Attendance at the daily tailgate meeting is mandatory for all employees at the site covered by this SWP and must be documented on the attendance form. All safety training documentation is to be maintained in the project file by the SSO.

4.4 Hazard Communication

Hazardous materials that may be encountered as existing on-site environmental or physical/health contaminants during the work activities are addressed in this SWP and their properties, hazards, and associated required controls will be communicated to all affected staff and subcontractors.

In addition, any employee or organization (contractor or subcontractor) intending to bring any hazardous material onto this AECOM-controlled work site must first provide a copy of the item's Material Safety Data Sheet (MSDS) to the SSO for review and filing (the SSO will maintain copies of all MSDS on site). MSDS may not be available for locally obtained products, in which case some alternate form of product hazard documentation will be acceptable in accordance with the requirements of *S3NA-507-PR Hazardous Materials Communication/WHMIS*.

All personnel shall be briefed on the hazards of any chemical product they use, and shall be aware of and have access to all MSDS.

All containers on site shall be properly labeled to indicate their contents. Labeling on any containers not intended for single-day, individual use shall contain additional information indicating potential health and safety hazards (flammability, reactivity, etc.).

Attachment B provides copies of MSDS for those items planned to be brought on site at the time this SWP is prepared. This information will be updated as required during site operations.

4.5 Confined Space Entry

The SSO/site supervisor shall identify all potential confined spaces in accordance with *S3NA-301-PR Confined Spaces*. In addition; the SSO/site supervisor will inform all employees of the location of onsite confined spaces and their associated security controls and procedures.

4.6 Hazardous, Solid, or Municipal Waste

If hazardous, solid, and/or municipal wastes are generated during any phase of the project, the waste shall be accumulated, labeled, and disposed of in accordance with applicable federal, state, provincial, territorial and/or local regulations. Consult the Regional SH&E Manager for further guidance.

4.7 General Safety Rules

All site personnel shall conduct themselves in a safe manner and maintain a working environment that is free of additional hazards, in adherence to *S3NA-001-PR Safe Work Standards and Rules* and *S3NA-103-PR General Housekeeping*.

4.8 Housekeeping

During site activities, work areas will be continuously policed for identification of excess trash and unnecessary debris. Excess debris and trash will be collected and stored in an appropriate container (e.g., plastic trash bags, garbage can, roll-off bin) prior to disposal. At no time will debris or trash be intermingled with waste PPE or contaminated materials.

4.9 Smoking, Eating, or Drinking

Smoking, eating and drinking will not be permitted inside any controlled work area at any time. Field workers will first wash hands and face immediately after leaving controlled work areas (and always prior to eating or drinking). Consumption of alcoholic beverages is prohibited at any AECOM site. Smoking, eating or drinking must be in an approved area.

4.9.1 Heat and Cold Stress

Heat and cold stress may vary based upon work activities, PPE/clothing selection, geographical locations, and weather conditions. To reduce the potential of developing heat/cold stress, be aware of the signs and symptoms of heat/cold stress and watch fellow employees for signs of heat/cold stress.

Heat stress can be a significant field site hazard, particularly for nonacclimated personnel operating in a hot, humid setting. Site personnel will be instructed in the identification of a heat stress victim, the first-aid treatment procedures for the victim and the prevention of heat stress casualties. Work-rest cycles will be determined and the appropriate measures taken to prevent heat stress as outlined in SH&E 616 *Heat Stress Prevention Program*.

4.9.1.1 Responding to Heat-Related Illness

The guidance below will be used in identifying and treating heat-related illness.

Table 4.7.3 Identification and Treatment of Heat-Related Illness

Type of Heat-Related Illness	Description	First Aid
Mild Heat Strain	The mildest form of heat-related illness. Victims exhibit irritability, lethargy, and significant sweating. The victim may complain of headache or nausea. This is the initial stage of overheating, and prompt action at this point may prevent more severe heat-related illness from occurring.	<ul style="list-style-type: none"> • Provide the victim with a work break during which he/she may relax, remove any excess protective clothing, and drink cool fluids. • If an air-conditioned spot is available, this is an ideal break location. • Once the victim shows improvement, he/she may resume working; however, the work pace should be moderated to prevent recurrence of the symptoms.
Heat Exhaustion	Usually begins with muscular weakness and cramping, dizziness, staggering gait, and nausea. The victim will have pale, clammy moist skin and may perspire profusely. The pulse is weak and fast and the victim may faint unless they lie down. The bowels may move involuntarily.	<ul style="list-style-type: none"> • Immediately remove the victim from the work area to a shady or cool area with good air circulation (<i>avoid drafts or sudden chilling</i>). • Remove all protective outerwear. • Call a physician. • Treat the victim for shock. (<i>Make the victim lie down, raise his or her feet 6–12 inches, and keep him/her cool by loosening all clothing</i>). • If the victim is conscious, it may be helpful to give him/her sips of water. • Transport victim to a medical facility ASAP.
Heat Stroke	The most serious of heat illness, heat stroke represents the collapse of the body's cooling mechanisms. As a result, body temperature may rise to 104 degrees Fahrenheit or higher. As the victim progresses toward heat stroke, symptoms such as headache, dizziness, nausea can be noted, and the skin is observed to be dry, red, and hot. Sudden collapse and loss of consciousness follows quickly and death is imminent if exposure continues. Heat stroke can occur suddenly.	<ul style="list-style-type: none"> • Immediately evacuate the victim to a cool/shady area. • Remove all protective outerwear and as much personal clothing as decency permits. • Lay the victim on his/her back w/the feet slightly elevated. • Apply cold wet towels or ice bags to the head, armpits, and thighs. • Sponge off the bare skin with cool water. • The main objective is to cool without chilling the victim. • Give no stimulants or hot drinks. • Since heat stroke is a severe medical condition requiring professional medical attention, emergency medical help should be summoned immediately to provide onsite treatment of the victim and proper transport to a medical facility.

4.10 Personal Protective Equipment

The purpose of personal protective equipment (PPE) is to provide a barrier that which will shield or isolate individuals from the chemical and/or physical hazards that may be encountered during work activities. *S3NA-208-PR Personal Protective Equipment Program* lists the general requirements for selection and usage of PPE. Table 7-1 lists the minimum PPE required during site operations and additional PPE that may be necessary. The specific PPE requirements for each work task are specified in the individual THAs.

By signing this SWP the employee agree having been trained in the use, limitations, care and maintenance of the protective equipment to be used by the employee at this project. If training has not been provided, request same of the PM/SSO for the proper training before signing.

Table: 4-8 Personal Protective Equipment

Type	Material	Additional Information
Minimum PPE		
Safety Vest	ANSI Type II high-visibility	Must have reflective tape/be visible from all sides
Boots	Leather	ANSI approved safety toe
Safety Glasses		ANSI Approved; ≥98% UV protection
Hard Hat		ANSI Approved; recommended wide-brim
Work Uniform		No shorts/cutoff jeans or sleeveless shirts
Additional PPE: [list all applicable information or delete not applicable rows]		
Hearing Protection	Ear plugs and/ or muffs	In hazardous noise areas
Leather Gloves		If working with sharp objects or powered equipment.
Protective Chemical Gloves	Inner: Outer:	
Protective Chemical Coveralls	Inner: Outer:	
Protective Chemical Boots		
Face Shield		Safety glasses or goggles must be worn concurrently.
Apron		
Sunscreen	SPF 30 or higher	
Welding Equipment		
Cooling Vest		
Cold Weather Gear	Hard hat liner, hand warmers, insulated gloves	

4.10.1 Personal Hygiene

The following personal hygiene requirements will be observed:

Water Supply: A water supply meeting the following requirements will be utilized:

Potable Water - An adequate supply of potable water will be available for field personnel consumption. Potable water can be provided in the form of water bottles, canteens, water coolers, or drinking fountains. Where drinking fountains are not available, individual-use cups will be provided as well as adequate disposal containers. Potable water containers will be properly identified in order to distinguish them from nonpotable water sources.

Nonpotable Water - Nonpotable water may be used for hand washing and cleaning activities. Nonpotable water will not be used for drinking purposes. All containers of nonpotable water will be marked with a label stating:

***Nonpotable Water
Not Intended for Drinking Water Consumption***

Toilet Facilities: A minimum of one toilet will be provided for every 20 personnel on site, with separate toilets maintained for each sex except where there are less than 5 total personnel on site. For mobile crews where work activities and locations permit transportation to nearby toilet facilities on-site facilities are not required.

Washing Facilities: Employees will be provided washing facilities (e.g., buckets with water and Alconox) at each work location. The use of water and hand soap (or similar substance) will be required by all employees following exit from the Exclusion Zone, prior to breaks, and at the end of daily work activities.

4.11 Buddy System

All field personnel will use the buddy system when working within any controlled work area. Personnel belonging to another organization on site can serve as "buddies" for AECOM personnel. Under no circumstances will any employee be present alone in a controlled work area. For areas not in controlled work areas, the procedures outlined in *S3NA-314-PR Working Alone Remote Travel* will be followed at all times.

4.12 Stop Work Authority

All employees have the right and duty to stop work when conditions are unsafe and to assist in correcting these conditions as outlined in *S3NA-002-PR Stop Work Authority*. Whenever the SSO determines that workplace conditions present an uncontrolled risk of injury or illness to employees, immediate resolution with the appropriate supervisor shall be sought. Should the supervisor be unable or unwilling to correct the unsafe conditions, the SSO is authorized and required to stop work, which shall be immediately binding on all affected AECOM employees and subcontractors.

Upon issuing the stop work order, the SSO shall implement corrective actions so that operations may be safely resumed. Resumption of safe operations is the primary objective; however, operations shall not resume until the Safety Professional has concurred that workplace conditions meet acceptable safety standards.

4.13 Client Specific Safety Requirements

The client has specified no additional health and safety requirements.

or

Client-specific health and safety guidelines are included in Attachment C of this SWP. All site activities must be performed in accordance with client-specific requirements and procedures.

[Or insert additional client-specific requirements]

Project Health and Safety Plan

approval page

This project Health and Safety Plan (HASP) was prepared for employees performing a specific, limited scope of work. It was prepared based on the best available information regarding the physical and chemical hazards known or suspected to be present on the project site. While it is not possible to discover, evaluate, and protect in advance against all possible hazards, which may be encountered during the completion of this project, adherence to the requirements of the HASP will significantly reduce the potential for occupational injury.

By signing below, I acknowledge that I have reviewed and hereby approve the HASP for the [site name] site. This HASP has been written for the exclusive use of AECOM, its employees, and subcontractors. The plan is written for specified site conditions, dates, and personnel, and must be amended if these conditions change.

Executive Summary

The purpose of this Health and Safety Plan (HASP) is to address health and safety concerns related to AECOM managed activities at the [site name] site, located at [site address] in [city, state]. The specific roles, responsibilities, authority, and requirements as they pertain to the safety of employees and the scope of services are discussed herein. The document is intended to identify known potential hazards and facilitate communication and control measures to prevent injury or harm. Additionally, provisions to control the potential for environmental impact from these activities are included where applicable.

[insert brief scope of services and responsible party]

AECOM will be...

Subcontractor X will be...

Subcontractor Y will be...

The primary physical hazards which may be encountered include:

[list PRIMARY physical hazards]

The chemical hazards which may be encountered include:

[list anticipated chemical hazards]

All staff are bound by the provisions of this HASP and are required to participate in a preliminary project safety meeting to familiarize them with the anticipated hazards and respective onsite controls. The discussion will cover the entire HASP subject matter, putting emphasis on critical elements of the plan; such as the emergency response procedures, personal protective equipment, site control strategies, and monitoring requirements. In addition, daily tailgate safety meetings will be held to discuss: the anticipated scope of work, required controls, identify new hazards and controls, incident reporting, review the results of inspections, any lessons learned or concerns from the previous day.

1.0 Introduction

This Health and Safety Plan (HASP) (including Attachments A-[xx]) provides a general description of the levels of personal protection and safe operating guidelines expected of each employee or subcontractor associated with the environmental services being conducted at the [site name] site, located at [site address] in [city, state/province]. This HASP also identifies chemical and physical hazards known to be associated with the AECOM-managed activities addressed in this document.

HASP Supplements will be generated as necessary to address any additional activities or changes in site conditions, which may occur during field operations.

1.1 General

1.1.1 The provisions of this HASP are mandatory for all AECOM personnel engaged in fieldwork associated with the environmental services being conducted at the subject site. A copy of this HASP, any applicable HASP Supplements and the AECOM's North America Safety, Health, and Environmental (SH&E) Procedures and Manual shall be accessible on site and available for review at all times. Record keeping will be maintained in accordance with this HASP and the applicable Standard Operating Procedures (SOPs). In the event of a conflict between this HASP, the SOPs and federal, provincial, state, and local regulations, workers shall follow the most stringent/protective requirements. Concurrence with the provisions of this HASP is mandatory for all personnel at the site covered by this HASP and must be signed on the acknowledgement page.

1.2 Project Policy Statement

AECOM is committed to protecting the safety and health of our employees and meeting our obligations with respect to the protection of others affected by our activities. We are also committed to protecting and preserving the natural environment in which we operate. The safety of persons and property is of vital importance to the success of this project and accident prevention measures shall be taken toward the avoidance of needless waste and loss. It shall be the policy of this project that all operations be conducted safely. Onsite supervisors are responsible for those they supervise by maintaining a safe and healthy working environment in their areas of responsibility, and by fairly and uniformly enforcing safety and health rules and requirements for all project personnel. Subcontractors shall comply with the requirements of this HASP, provisions contained within the contract document and all applicable rules, requirements and health, safety and environmental regulations. All practical measures shall be taken to promote safety and maintain a safe place to work. Contractors are wholly responsible for the prevention of accidents on work under their direction and shall be responsible for thorough safety and loss control programs and the execution of their own safety plans for the protection of workers.

1.3 References

This HASP conforms to the regulatory requirements and guidelines established in the following documents:

- Title 29, Part 1910 of the Code of Federal Regulations (29 CFR 1910), Occupational Safety and Health Standards (with special attention to Section 120, Hazardous Waste Operations and Emergency Response).
- Title 29, Part 1926 of the Code of Federal Regulations (29 CFR 1926), Safety and Health Regulations for Construction.
- National Institute for Occupational Safety and Health (NIOSH)/OSHA/U.S. Coast Guard (USCG)/EPA, Occupational Safety and Health Guidance Manual for Hazardous Waste Site Activities, Publication No. 85-115, 1985.
- In Canada there is no direct federal or provincial counterpart to HAZWOPER; however, as due diligence and in compliance with applicable provincial duty of care/general duty clauses, staff working in Canada will comply with S3NA-509-PR Hazardous Waste Operations and Emergency Response Activities.
- [Insert state or other requirements]

2.0 Site Information and Scope of Work

AECOM will conduct environmental services at the [site name] site. Work will be performed in accordance with the applicable Statement of Work (SOW) and associated Project Work Plan developed for project site. Deviations from the listed SOW will require that a Safety Professional review and changes made to this HASP, to ensure adequate protection of personnel and other property.

The following is a summary of relevant data concerning the project site, and the work procedures to be performed. The Project Work Plan prepared by AECOM as a companion document to this HASP provides more detail concerning both site history and planned work operations.

2.1 Site Information

This section provides a general description and historical information associated with the site.

2.1.1 General Description

The [site name] site is located at [site address]. [Insert description. This should include any *significant* physical features of the site (i.e., terrain, buildings, size, location, bodies of water etc.)].

2.1.2 Site Background/History

[Insert site background/history information. This should include all applicable activities and processes that have previously occurred on site, as well as current operations.]

2.1.3 Previous Investigations

[Insert previous highest concentration investigation results in the applicable work area. This should list any known investigations and the results of the investigations. Contaminants with their concentrations (soil in mg/kg and/or groundwater in ug/l) should be listed in tabular format (2-1), if available. This should be the most recent site data available.]

Table 2-1: Previous Investigation Data

Contaminants	Soil (mg/kg)	Groundwater (ug/l)
(insert Highest Contaminants)		
(insert second Highest Contaminants)		
(Insert third highest Contaminants)		

2.2 Scope of Work

[Provide a verbal description of the overall objective for what is being done for the job and what is supposed to be accomplished. This does not have to actually spell out the steps for the job, as that will be covered in 2.2.1]

(See HASP Description and Assistance document for examples)

2.2.1 Additional Work Operations

The following additional tasks will also be performed as necessary in support of planned site activities:

(Operations at the site may require additional tasks not identified in this section or addressed in Attachment A THAs. Before performing any task not covered in this HASP a THA must be prepared, and approved by the Safety Professional.)

3.0 Hazard Assessment (Safety)

3.1 Physical Hazards

[Discuss the specifics of hazards that will/may be encountered, like haz noise, heavy equip. etc.. Limit the discussion to the scope and magnitude of the hazard on this job, don't discuss hazard control.]

(See HASP Description and Assistance document for examples)

3.2 Wildlife, Plant and Insect Hazards

Below is a series of tasks typically encountered on projects. While the text below may be used to describe your work, it must be elaborated on and sufficient detail included making it site specific.

(See HASP Description and Assistance document for examples)

3.3 Radiological Hazards

[Discuss any on-site radioactive materials that are environmental contaminants (ignore RAM in devices, etc. that we bring to site.)]

3.4 Ultraviolet Hazards

[The 2009 historical UV Index for the [Insert City here] area showed that worker's UV exposures were in the HIGH category beginning in March and lasting until November with worker's exposures in the EXTREME category from July through August. In 2009, [City Name] had 44 days in the HIGH category, 133 days in the VERY HIGH category, and 0 days in the EXTREME category. Workers performing field work outdoors may be susceptible to sunburn if not properly protected with sunscreen or protective clothing and hats. Skin can burn in minutes when the UV Index is VERY HIGH. Protective measures are advisable.]

3.5 Weather Hazards

The Site Safety Officer will be attentive to daily weather forecasts for the project area each morning. Predicted weather conditions of potential field impact are to be included in safety briefings and the Task Hazard Analysis (THA) for that day. Weather changes should initiate a review and updates (THA) as necessary.

Severe weather can occur with little warning. Employees will be vigilant for the potentials for storms, lightning, high winds, and flash flood events.

3.6 Other Hazards

[Address anything not already covered that might be significant, like UXO. Don't provide control procedures here (that's for Section 5.0), just discuss what's there and what it can do].

3.7 Hazard Analysis

Task Hazard Analyses (THAs) have been completed for all tasks identified in the Scope of Work (Attachment A):

[List all Tasks which have been addressed in THAs]

3.7.1 Unanticipated Work Activities/Conditions

As a result of unanticipated work activities or changing conditions, additional THAs may be required. All additional THAs will be reviewed and approved by the SH&E Professional.

3.8 Task Specific SH&E Procedures

As discussed in Section 5.0, personnel may be exposed to a variety of chemical, physical, and radiological hazards resulting from task or equipment-specific activities. The controls for many of these hazards are discussed in SOPs found in the **Series 300 to 500** North America SH&E SOPs.

4.0 SH&E Requirements (Safety)

4.1 HAZWOPER Qualifications

Personnel performing work at the job site must be qualified as HAZWOPER workers (unless otherwise noted in specific THAs or by the SSO), and must meet the medical monitoring and training requirements specified in the AECOM's North America SH&E Standard Operating Procedures.

If site monitoring procedures indicate that a possible exposure has occurred above the OSHA permissible exposure limit (PEL), employees may be required to receive supplemental medical testing to document any symptoms that may be specific to the particular materials present.

4.2 Site-Specific Safety Training

All AECOM personnel performing activities at the site will be trained in accordance with *S3NA-003-PR SH&E Training*. All personnel are required to remain current in all of their required training and evaluate their need for additional training when there is a change in work. In addition to the general health and safety training programs, personnel will be required to complete any supplemental task specific training developed for the tasks to be performed. Administration and compliance with the requirements for additional task-specific training will be the responsibility of the project or lead manager. Any additional required training that is completed will be documented and tracked in the project files.

4.2.1 Competent Person Training Requirements

In order to complete the planned scope of work, an (OSHA conformance) competent person must be designated to perform the required daily on site inspections of operations and/or equipment. The competent person may be an AECOM (if responsible for supervising that activity) or the subcontractor's employee. Designated competent person(s) for this project are shown in Table 4-2:

Table 4.2.1-2: Task-Specific Competent Persons

Employee Name	Organization	Area of Competency
		[insert other requirements or delete rows]

Note: The training requirements for competent persons are specified in the indicated SOPs and/or *S3NA-202-PR Competent Person Designation*. By identifying an employee as a "competent person", that person has now been authorized to take prompt corrective measures to eliminate hazards.

4.3 Tailgate Meetings

Prior to the commencement of daily project activities, a tailgate meeting will be conducted by the SSO to review the specific requirements of this HASP, applicable THA. Attendance at the daily tailgate meeting is mandatory for all employees at the site covered by this HASP and must be documented on the attendance form. All safety training documentation is to be maintained in the project file by the SSO.

4.4 Hazard Communication

Hazardous materials that may be encountered as existing on-site environmental or physical/health contaminants during the work activities are addressed in this HASP and their properties, hazards and associated required controls will be communicated to all affected staff and subcontractors.

In addition, any employee or organization (contractor or subcontractor) intending to bring any hazardous material onto this AECOM-controlled work site must first provide a copy of the item's Material Safety Data Sheet (MSDS) to the SSO for review and filing (the SSO will maintain copies of all MSDS on site). MSDS may not be available for locally-obtained products, in which case some alternate form of product hazard documentation will be acceptable in accordance with the requirements of *S3NA-507-PR Hazardous Materials Communication/WHMIS*.

All personnel shall be briefed on the hazards of any chemical product they use, and shall be aware of and have access to all MSDS.

All containers on site shall be properly labeled to indicate their contents. Labeling on any containers not intended for single-day, individual use shall contain additional information indicating potential health and safety hazards (flammability, reactivity, etc.).

Attachment B provides copies of MSDS for those items planned to be brought on site at the time this HASP is prepared. This information will be updated as required during site operations.

4.5 Confined Space Entry

The SSO/site supervisor shall identify all potential confined spaces in accordance with *S3NA-301-PR Confined Spaces*. In addition; the SSO/site supervisor will inform all employees of the location of onsite confined spaces, and their associated security controls and procedures.

4.6 Hazardous, Solid, or Municipal Waste

If hazardous, solid, and/or municipal wastes are generated during any phase of the project, the waste shall be accumulated, labeled, and disposed of in accordance with applicable Federal, State, Provincial, Territorial and/or local regulations. Consult the Regional SH&E Manager for further guidance.

4.7 General Safety Rules

All site personnel shall conduct themselves in a safe manner and maintain a working environment that is free of additional hazards, in adherence to *S3NA-001-PR Safe Work Standards and Rules* and *S3NA-103-PR General Housekeeping*.

4.7.1 Housekeeping

During site activities, work areas will be continuously policed for identification of excess trash and unnecessary debris. Excess debris and trash will be collected and stored in an appropriate container (e.g., plastic trash bags, garbage can, roll-off bin) prior to disposal. At no time will debris or trash be intermingled with waste PPE or contaminated materials.

4.7.2 Smoking, Eating, or Drinking

Smoking, eating and drinking will not be permitted inside any controlled work area at any time. Field workers will first wash hands and face immediately after leaving controlled work areas (and always prior to eating or drinking). Consumption of alcoholic beverages is prohibited at any AECOM site. Smoking, eating or drinking must be in an approved area.

4.7.3 Personal Hygiene

The following personal hygiene requirements will be observed:

Water Supply: A water supply meeting the following requirements will be utilized:

Potable Water - An adequate supply of potable water will be available for field personnel consumption. Potable water can be provided in the form of water bottles, canteens, water coolers, or drinking fountains. Where drinking fountains are not available, individual-use cups will be provided as well as adequate disposal containers. Potable water containers will be properly identified in order to distinguish them from non-potable water sources.

Non-Potable Water - Non-potable water may be used for hand washing and cleaning activities. Non-potable water will not be used for drinking purposes. All containers of non-potable water will be marked with a label stating:

***Non-Potable Water
Not Intended for Drinking Water Consumption***

Toilet Facilities: A minimum of one toilet will be provided for every 20 personnel on site, with separate toilets maintained for each sex except where there are less than 5 total personnel on site. For mobile crews where work activities and locations permit transportation to nearby toilet facilities on-site facilities are not required.

Washing Facilities: Employees will be provided washing facilities (e.g., buckets with water and Alconox) at each work location. The use of water and hand soap (or similar substance) will be required by all employees following exit from the Exclusion Zone, prior to breaks, and at the end of daily work activities.

4.7.4 Buddy System

All field personnel will use the buddy system when working within any controlled work area. Personnel belonging to another organization on site can serve as "buddies" for AECOM personnel. Under no circumstances will any employee be present alone in a controlled work area. For areas not in controlled work areas, the procedures outlined in *S3NA-314-PR Working Alone Remote Travel* will be followed at all times.

4.8 Stop Work Authority

All employees have the right and duty to stop work when conditions are unsafe and to assist in correcting these conditions as outlined in *S3NA-002-PR Stop Work Authority*. Whenever the SSO determines that workplace conditions present an uncontrolled risk of injury or illness to employees, immediate resolution with the appropriate supervisor shall be sought. Should the supervisor be unable or unwilling to correct the unsafe conditions, the SSO is authorized and required to stop work, which shall be immediately binding on all affected AECOM employees and subcontractors.

Upon issuing the stop work order, the SSO shall implement corrective actions so that operations may be safely resumed. Resumption of safe operations is the primary objective; however, operations shall not resume until the Safety Professional has concurred that workplace conditions meet acceptable safety standards.

4.9 Client Specific Safety Requirements

The client has specified no additional health and safety requirements.

or

Client-specific health and safety guidelines are included in Attachment E of this HASP. All site activities must be performed in accordance with client-specific requirements and procedures.

[or insert additional client-specific requirements]

5.0 Exposure Monitoring Procedures (Health)

5.1 Contaminant Exposure Hazards

The following is a discussion of the hazards presented to worker personnel during this project from on-site chemical and radiological hazards known, suspected or anticipated to be present on site.

Exposure symptoms and applicable first aid information for each suspected site contaminant identified in the Scope of Work are located in the following subsections.

[insert chemical/chem. group-specific discussions for what is at your site]

-
-
-
-

5.1.1 [insert contaminant]

[insert contaminant information]

5.1.2 [insert contaminant]

[insert contaminant information]

5.1.3 [insert contaminant]

[insert contaminant information]

5.2 Route of Entry Assessment of Exposure Hazards

Inhalation: [Discuss the possible hazards from inhalation based on what's there and what's being done]. [discuss any general things being done to protect, like RPP, monitoring, etc.].

Skin Contact: [Discuss the possible hazards from skin contact (irritation and absorption) based on what's there and what's being done – don't forget the eyes, etc.]. [Discuss any general things being done to protect, like PPE, decon, etc.].

Ingestion: [Discuss the possibility of ingestion exposure based on what's there and what's being done.]. Protection against exposure via ingestion can be accomplished by performance of proper decontamination procedures when exiting contaminated work areas.

Monitoring procedures will be employed during site characterization activities to assess employee exposure to chemical and physical hazards. Monitoring will consist primarily of onsite determination of various parameters (e.g., airborne contaminant concentrations and heat stress effects), but may be supplemented by more sophisticated monitoring techniques, if necessary.

5.3 Real-Time Exposure Measurement

Monitoring shall be performed within the work area on site in order to detect the presence and relative levels of toxic substances. The data collected throughout monitoring shall be used to determine the appropriate levels of PPE. Monitoring shall be conducted as specified in each THA as work is performed.

Table 5-1 specifies the real-time monitoring equipment, which will be used for this project. [Delete instruments from the table that are not applicable to the project.]

Table 5-1: Monitoring Parameters and Equipment

INSTRUMENT	MANUFACTURER/MODEL*	SUBSTANCES DETECTED
Photo Ionization Detector (PID)	RAE Systems mini-RAE Photovac Microtip HNu Model Hnu (min. 10.2 eV bulb)	Petroleum hydrocarbons Organic Solvents
Flame Ionization Detector (FID)	Foxboro	Petroleum hydrocarbons Organic Solvents
Combustible Gas Indicator (CGI) May be combined with individual or multi-gas detectors.		Explosively
Individual Gas Detectors		Oxygen (O ₂) Carbon Monoxide (CO) Hydrogen Sulfide (H ₂ S) Cyanide Gases (CN ⁻)
Particulate Monitor	MIE Model PDM-3 mini-RAM	Aerosols, mist, dust, and fumes
Colorimetric Detector Tubes	Sensidyne Draeger	Benzene 0.5–10 ppm [list additional]
[insert additional]		

*Or similar unit, as approved by the SH&E Professional

5.4 Health and Safety Action Levels

An action level is a point at which increased protection is required due to the concentration of contaminants in the work area or other environmental conditions. The concentration level (above background level) and the ability of the PPE to protect against that specific contaminant determine each action level. The action levels are based on concentrations in the breathing zone.

If ambient levels are measured which exceed the action levels in areas accessible to unprotected personnel, necessary control measures (barricades, warning signs, and mitigative actions to limit, etc.) must be implemented prior to commencing activities at the specific work area.

Personnel should also be able to upgrade or downgrade their level of protection with the concurrence of SSO or the Safety Professional.

Reasons to upgrade:

- Known or suspected presence of dermal hazards.
- Occurrence or likely occurrence of gas, vapor, or dust emission.
- Change in work task that will increase the exposure or potential exposure to hazardous materials.

Reasons to downgrade:

- New information indicating that the situation is less hazardous than was originally suspected.
- Change in site conditions that decrease the potential hazard.
- Change in work task that will reduce exposure to hazardous materials.

5.4.1 Monitoring Procedures

[Contact an SH&E Professional for guidance. This section must be approved by the Regional SH&E/District SH&EM prior to the start of field work.]

5.4.1.1 Monitoring Equipment Calibration

All instruments used will be calibrated at the beginning and end of each work shift, in accordance with the manufacturer's recommendations. If the owner's manual is not available, the personnel operating the equipment will contact the applicable office representative, rental agency or manufacturer for technical guidance for proper calibration. If equipment cannot be pre-calibrated to specifications, site operations requiring monitoring for worker exposure or off-site migration of contaminants will be postponed or temporarily ceased until this requirement is completed.

5.4.1.2 Personal Sampling

Should site activities warrant performing personal sampling (breathing zone) to better assess chemical exposures experienced by AECOM employees, the SSO, under the direction of a Certified Industrial Hygienist (CIH), Certified Safety Professional (CSP) will be responsible for specifying the monitoring required. Within five working days after the receipt of monitoring results, the CIH or CSP will notify each employee, in writing, of the results that represent that employee's exposure. Copies of air sampling results will be maintained in the SSO project files.

If the site activities warrant, the subcontractor will ensure its employees' exposures are quantified via the use of appropriate sampling techniques. The subcontractor shall notify the employees sampled in accordance with health and safety regulations, and provide the results to the SSO for use in determining the potential for other employees' exposure.

5.5 Heat and Cold Stress

Heat and cold stress may vary based upon work activities, PPE/clothing selection, geographical locations, and weather conditions. To reduce the potential of developing heat/cold stress, be aware of the signs and symptoms of heat/cold stress and watch fellow employees for signs of heat/cold stress.

Heat stress can be a significant field site hazard, particularly for non-acclimated personnel operating in a hot, humid setting. Site personnel will be instructed in the identification of a heat stress victim, the first-aid treatment procedures for the victim and the prevention of heat stress casualties. Work-rest cycles will be determined and the appropriate measures taken to prevent heat stress as outlined in *S3NA-511-PR Heat Stress Prevention Program*.

5.5.1 Responding to Heat-Related Illness

The guidance below will be used in identifying and treating heat-related illness.

Table 5.5.1: Identification and Treatment of Heat-Related Illness

Type of Heat-Related Illness	Description	First Aid
Mild Heat Strain	The mildest form of heat-related illness. Victims exhibit irritability, lethargy, and significant sweating. The victim may complain of headache or nausea. This is the initial stage of overheating, and prompt action at this point may prevent more severe heat-related illness from occurring.	<ul style="list-style-type: none"> • Provide the victim with a work break during which he/she may relax, remove any excess protective clothing, and drink cool fluids. • If an air-conditioned spot is available, this is an ideal break location. • Once the victim shows improvement, he/she may resume working; however, the work pace should be moderated to prevent recurrence of the symptoms.
Heat Exhaustion	Usually begins with muscular weakness and cramping, dizziness, staggering gait, and nausea. The victim will have pale, clammy moist skin and may perspire profusely. The pulse is weak and fast and the victim may faint unless they lie down. The bowels may move involuntarily.	<ul style="list-style-type: none"> • Immediately remove the victim from the work area to a shady or cool area with good air circulation (<i>avoid drafts or sudden chilling</i>). • Remove all protective outerwear. • Call a physician. • Treat the victim for shock. (<i>Make the victim lie down, raise his or her feet 6–12 inches, and keep him/her cool by loosening all clothing</i>). • If the victim is conscious, it may be helpful to give him/her sips of water. • Transport victim to a medical facility ASAP.

Type of Heat-Related Illness	Description	First Aid
Heat Stroke	The most serious of heat illness, heat stroke represents the collapse of the body's cooling mechanisms. As a result, body temperature may rise to 104 degrees Fahrenheit or higher. As the victim progresses toward heat stroke, symptoms such as headache, dizziness, nausea can be noted, and the skin is observed to be dry, red, and hot. Sudden collapse and loss of consciousness follows quickly and death is imminent if exposure continues. Heat stroke can occur suddenly.	<ul style="list-style-type: none"> • Immediately evacuate the victim to a cool/shady area. • Remove all protective outerwear and as much personal clothing as decency permits. • Lay the victim on his/her back w/the feet slightly elevated. • Apply cold wet towels or ice bags to the head, armpits, and thighs. • Sponge off the bare skin with cool water. • The main objective is to cool without chilling the victim. • Give no stimulants or hot drinks. • Since heat stroke is a severe medical condition requiring professional medical attention, emergency medical help should be summoned immediately to provide onsite treatment of the victim and proper transport to a medical facility.

6.0 Environmental Program (Environment)

6.1 Environmental Compliance and Management

This project and the individual tasks will comply with all federal, state, provincial, and local environmental requirements.

[Give a brief description of the environmental compliance and management requirements for the project site.]

6.1.1 Air Emissions

[Discuss any operations where air emissions may negatively impact the surrounding environment, air emission permits, etc. and discuss associated control of emissions in Section 6.]

6.1.2 Hazardous Waste Management

[Discuss any operations involving the storage, treatment, or disposal of hazardous waste at the project site, RCRA Part B permits or equivalent, 90-day storage procedures, etc. and discuss controls in Section 6.]

6.1.3 Storm Water Pollution Prevention

[Discuss any operations that may generate/discharge stormwater from the project site, NPDES/general construction stormwater discharge permits, etc. and discuss BMPs and other controls in Section 6.]

6.1.4 Wetlands Protection

[Use the FWS online wetlands mapper (<http://www.fws.gov/wetlands/Data/mapper.html>) to determine if any wetlands exists on your project site, are adjacent to your project, or may be negatively impacted by your project, do you need a regulatory permit, discuss wetlands protection measures/controls in Section 6, etc.] – suggest adding the map as a figure to the HASP or keeping it in the project files as the official risk assessment/determination process.

6.1.5 Critical Habitat Protection

[Use the FWS online critical habitat mapper tool (<http://criticalhabitat.fws.gov/>) to determine if any plant or animal critical habitats exists on, adjacent to, or may be otherwise impacted by your project, do you need a regulatory permit, discuss critical habitat protection/control measures in Section 6, etc.] – suggest adding the map as a figure to the HASP or keeping it in the project files as the official risk assessment/determination process.

6.1.6 Environmental Protection

[Discuss any environmental protection controls you will implement on your project such as sediment control, stormwater infiltration control, measures to mitigate impacts on wetlands, critical habitat protection, endangered species protection, etc.]

6.1.7 [add here anything else]

[specify if necessary]

7.0 Personal Protective Equipment

7.1 Personal Protective Equipment

The purpose of personal protective equipment (PPE) is to provide a barrier, which will shield or isolate individuals from the chemical and/or physical hazards that may be encountered during work activities. *S3NA-208-PR Personal Protective Equipment Program* lists the general requirements for selection and usage of PPE. Table 7-1 lists the minimum PPE required during site operations and additional PPE that may be necessary. The specific PPE requirements for each work task are specified in the individual THAs.

By signing this HASP the employee agree having been trained in the use, limitations, care and maintenance of the protective equipment to be used by the employee at this project. If training has not been provided, request same of the PM/SSO for the proper training before signing.

Table 7-1: Personal Protective Equipment

<u>TYPE</u>	<u>MATERIAL</u>	<u>ADDITIONAL INFORMATION</u>
Minimum PPE		
Safety Vest	ANSI Type II high-visibility	Must have reflective tape/be visible from all sides.
Boots	Leather	ANSI approved safety toe.
Safety Glasses		ANSI Approved; ≥98% UV protection.
Hard Hat		ANSI Approved; recommended wide-brim.
Work Uniform		No shorts/cutoff jeans or sleeveless shirts.
Additional PPE: [list all applicable information or delete not applicable rows]		
Hearing Protection	Ear plugs and/ or muffs	In hazardous noise areas.
Leather Gloves		If working with sharp objects or powered equipment.
Protective Chemical Gloves	Inner: Outer:	
Protective Chemical Coveralls	Inner: Outer:	
Protective Chemical Boots		
Level C Respiratory Protection	MSA (Full Face or equivalent) equipped with GMA/P100	
Level B Respiratory Protection	Self Contained Breathing Apparatus (SCBA), Airline with 5 minute escape pack.	Grade "D" Certified Air (Certificate Required). Obtain certificate of analysis from compressed gas vendor.
Face Shield		Safety glasses or goggles must be worn concurrently.
Apron		
Sunscreen	SPF 30 or higher	
Welding Equipment		
Cooling Vest		
Cold Weather Gear	Hard hat liner, hand warmers, insulated gloves	
Fall Protection		
Insert		
Insert		

7.2 PPE Doffing and Donning (UTILIZATION) Information

The following information is to provide field personnel with helpful hints that, when applied, make donning and doffing of PPE a more safe and manageable task:

- Never cut disposable booties from your feet with basic utility knives. This has resulted in workers cutting through the bootie and the underlying sturdy leather work boot, resulting in significant cuts to the legs/ankles. Recommend using a pair of scissors or a package/letter opener (cut above and parallel with the work boot) to start a cut in the edge of the bootie, then proceed by manually tearing the material down to the sole of the bootie for easy removal.
- When applying duct tape to PPE interfaces (wrist, lower leg, around respirator, etc.) and zippers, leave approximately one inch at the end of the tape to fold over onto itself. This will make it much easier to remove the tape by providing a small handle to grab while still wearing gloves. Without this fold, trying to pull up the tape end with multiple gloves on may be difficult and result in premature tearing of the PPE.
- Have a “buddy” check your ensemble to ensure proper donning before entering controlled work areas. Without mirrors, the most obvious discrepancies can go unnoticed and may result in a potential exposure situation.
- Never perform personal decontamination with a pressure washer.

7.3 Decontamination

7.3.1 General Requirements

All possible and necessary steps shall be taken to reduce or minimize contact with chemicals and contaminated/impacted materials while performing field activities (e.g., avoid sitting or leaning on, walking through, dragging equipment through or over, tracking, or splashing potential or known contaminated/impacted materials, etc).

All personal decontamination activities shall be performed with an attendant (buddy) to provide assistance to personnel that are performing decontamination activities. Depending on specific site hazards, attendants may be required to wear a level of protection that is equal to the required level in the Exclusion Zone (EZ).

All persons and equipment entering the EZ shall be considered contaminated, and thus, must be properly decontaminated prior to entering the SZ.

Decontamination procedures may vary based on site conditions and nature of the contaminant(s). If chemicals or decontamination solutions are used, care should be taken to minimize reactions between the solutions and contaminated materials. In addition, personnel must assess the potential exposures created by the decontamination chemical(s) or solutions. The applicable Material Safety Data Sheet (MSDS) must be reviewed, implemented, and filed by personnel contacting the chemicals/solutions.

All contaminated PPE and decontamination materials shall be contained, stored and disposed of in accordance with site-specific requirements determined by site management.

7.3.2 Decontamination Equipment

The equipment required to perform decontamination may vary based on site-specific conditions and the nature of the contaminant(s). The following equipment is commonly used for decontamination purposes:

- Soft-bristle scrub brushes or long-handled brushes to remove contaminants;
- Hoses, buckets of water or garden sprayers for rinsing;
- Large plastic/galvanized wash tubs or children's wading pools for washing and rinsing solutions;
- Large plastic garbage cans or similar containers lined with plastic bags for the storage of contaminated clothing and equipment;
- Metal or plastic cans or drums for the temporary storage of contaminated liquids; and
- Paper or cloth towels for drying protective clothing and equipment.

7.3.3 Personal/Equipment Decontamination

All equipment leaving the EZ shall be considered contaminated and must be properly decontaminated to minimize the potential for exposure and off-site migration of impacted materials. Such equipment may include, but is not limited to: sampling tools, heavy equipment, vehicles, PPE, support devices (e.g., hoses, cylinders, etc.), and various handheld tools.

All employees performing equipment decontamination shall wear the appropriate PPE to protect against exposure to contaminated materials. The level of PPE may be equivalent to the level of PPE required in the EZ. Other PPE may include splash protection, such as face-shields and splash suits, and knee protectors. Following equipment decontamination, employees may be required to follow the proper personal decontamination procedures above.

[The SH&E Professional will outline the personal decontamination steps here in bullet format.]

For larger equipment, a high-pressure washer may need to be used. Some contaminants require the use of a detergent or chemical solution and scrub brushes to ensure proper decontamination.

For smaller equipment, use the following steps for decontamination:

- Remove majority of visible gross contamination in EZ.
- Wash equipment in decontamination solution with a scrub brush and/or power wash heavy equipment.
- Rinse equipment.
- Visually inspect for remaining contamination.
- Follow appropriate personal decontamination steps outlined above.

All decontaminated equipment shall be visually inspected for contamination prior to leaving the Contaminant Reduction Zone (CRZ). Signs of visible contamination may include an oily sheen, residue or contaminated soils left on the equipment. All equipment with visible signs of contamination shall be discarded or re-decontaminated until clean. Depending on the nature of the contaminant, equipment may have to be analyzed using a wipe method or other means.

[The SH&E Professional, in coordination with the Corporate Radiation Safety Officer, must specify the applicable radiological decontamination procedures along with the applicable removable monitoring limits in CPM, as applicable to the project]

8.0 Project Health and Safety Organization

8.1 Project Manager [insert Name, if available]

The Project Manager (PM) has overall management authority and responsibility for all site operations, including safety. The PM will provide the site supervisor with work plans, staff, and budgetary resources, which are appropriate to meet the safety needs of the project operations.

8.2 Site Supervisor [insert Name, if available]

The site supervisor has the overall responsibility and authority to direct work operations at the job site according to the provided work plans. The PM may act as the site supervisor while on site.

8.2.1 Responsibilities

The site supervisor is responsible to:

- Discuss deviations from the work plan with the SSO and PM.
- Discuss safety issues with the PM, SSO, and field personnel.
- Assist the SSO with the development and implementation of corrective actions for site safety deficiencies.
- Assist the SSO with the implementation of this HASP and ensuring compliance.
- Assist the SSO with inspections of the site for compliance with this HASP and applicable SOPs.

8.2.2 Authority

The site supervisor has authority to:

- Verify that all operations are in compliance with the requirements of this HASP, and halt any activity that poses a potential hazard to personnel, property, or the environment.
- Temporarily suspend individuals from field activities for infractions against the HASP pending consideration by the SSO, the Safety Professional, and the PM.

8.2.3 Qualifications

In addition to being Hazardous Waste Operations and Emergency Response (HAZWOPER)-qualified (see Section 4.1), the Site Supervisor is required to have completed the 8-hour HAZWOPER Supervisor Training Course in accordance with 29 CFR 1910.120 (e)(4).

8.3 Site Safety Officer [insert Name, if available]

8.3.1 Responsibilities

The SSO is responsible to:

- Update the site-specific HASP to reflect changes in site conditions or the scope of work. HASP updates must be reviewed and approved by the Safety Professional.
- Be aware of changes in AECOM Safety Policy.
- Monitor the lost time incidence rate for this project and work toward improving it.
- Inspect the site for compliance with this HASP and the SOPs using the appropriate audit inspection checklist provided by an AECOM Safety Professional.
- Work with the site supervisor and PM to develop and implement corrective action plans to correct deficiencies discovered during site inspections. Deficiencies will be discussed with project management to determine appropriate corrective action(s).
- Contact the Safety Professional for technical advice regarding safety issues.

- Provide a means for employees to communicate safety issues to management in a discreet manner (i.e., suggestion box, etc.).
- Determine emergency evacuation routes, establishing and posting local emergency telephone numbers, and arranging emergency transportation.
- Check that all site personnel and visitors have received the proper training and medical clearance prior to entering the site.
- Establish any necessary controlled work areas (as designated in this HASP or other safety documentation).
- Present tailgate safety meetings and maintain attendance logs and records.
- Discuss potential health and safety hazards with the Site Supervisor, the Safety Professional, and the PM.
- Select an alternate SSO by name and inform him/her of their duties, in the event that the SSO must leave or is absent from the site.

8.3.2 Authority

The SSO has authority to:

- Verify that all operations are in compliance with the requirements of this HASP.
- Issue a "Stop Work Order" under the conditions set forth in this HASP.
- Temporarily suspend individuals from field activities for infractions against the HASP pending consideration by the Safety Professional and the PM.

8.3.3 Qualifications

In addition to being HAZWOPER-qualified, the SSO is required to have completed the 8-hour HAZWOPER Supervisor Training Course in accordance with 29 CFR 1910.120 (e)(4).

8.4 Employees

8.4.1 Employee Responsibilities

Responsibilities of employees associated with this project include, but are not limited to:

- Understanding and abiding by the policies and procedures specified in the HASP and other applicable safety policies, and clarifying those areas where understanding is incomplete.
- Providing feedback to health and safety management relating to omissions and modifications in the HASP or other safety policies.
- Notifying the SSO, in writing, of unsafe conditions and acts.

8.4.2 Employee Authority

The health and safety authority of each employee assigned to the site includes the following:

- The right to refuse to work and/or stop work authority when the employee feels that the work is unsafe (including subcontractors or team contractors), or where specified safety precautions are not adequate or fully understood.
- The right to refuse to work on any site or operation where the safety procedures specified in this HASP or other safety policies are not being followed.
- The right to contact the SSO or the Safety Professional at any time to discuss potential concerns.
- The right and duty to stop work when conditions are unsafe, and to assist in correcting these conditions.

8.5 Safety Professional [insert Name, if available]

8.5.1 The Safety Professional is the member of the AECOM Safety, Health and Environmental Department assigned to provide guidance and technical support for the project. Duties include the following:

- Approving this HASP and any required changes.
- Approving the designated Site Safety Officer (SSO).
- Reviewing all personal exposure monitoring results.
- Investigating any reported unsafe acts or conditions.

8.6 Subcontractors

The requirements for subcontractor selection and subcontractor safety responsibilities are outlined in *S3NA-213-PR Subcontractors*. Each AECOM subcontractor is responsible for assigning specific work tasks to their employees. Each subcontractor's management will provide qualified employees and allocate sufficient time, materials, and equipment to safely complete assigned tasks. In particular, each subcontractor is responsible for equipping its personnel with any required personnel protective equipment (PPE and all required training.

AECOM considers each subcontractor to be an expert in all aspects of the work operations for which they are tasked to provide, and each subcontractor is responsible for compliance with the regulatory requirements that pertain to those services. Each subcontractor is expected to perform its operations in accordance with its own unique safety policies and procedures, in order to ensure that hazards associated with the performance of the work activities are properly controlled. Copies of any required safety documentation for a subcontractor's work activities will be provided to AECOM for review prior to the start of onsite activities, if required.

Hazards not listed in this HASP but known to any subcontractor, or known to be associated with a subcontractor's services, must be identified and addressed to the AECOM PM or the Site Supervisor prior to beginning work operations. The Site Supervisor or authorized representative has the authority to halt any subcontractor operations, and to remove any subcontractor or subcontractor employee from the site for failure to comply with established health and safety procedures or for operating in an unsafe manner.

8.7 Visitors

Authorized visitors (e.g., client representatives, regulators, AECOM management staff, etc.) requiring entry to any work location on the site will be briefed by the PM on the hazards present at that location. Visitors will be escorted at all times at the work location and will be responsible for compliance with their employer's health and safety policies. In addition, this HASP specifies the minimum acceptable qualifications, training and personal protective equipment which are required for entry to any controlled work area; visitors must comply with these requirements at all times.

8.7.1 Visitor Access

Visitors to any HAZWOPER controlled-work area must comply with the health and safety requirements of this HASP, and demonstrate an acceptable need for entry into the work area. All visitors desiring to enter any controlled work area must observe the following procedures:

- A written confirmation must be received by AECOM documenting that each of the visitors has received the proper training and medical monitoring required by this HASP. Verbal confirmation can be considered acceptable provided such confirmation is made by an officer or other authorized representative of the visitor's organization.
- Each visitor will be briefed on the hazards associated with the site activities being performed and acknowledge receipt of this briefing by signing the appropriate tailgate safety briefing form.
- All visitors must be escorted by an AECOM employee.

If the site visitor requires entry to any EZ, but does not comply with the above requirements, all work activities within the EZ must be suspended. Until these requirements have been met, entry will not be permitted.

Unauthorized visitors, and visitors not meeting the specified qualifications, will not be permitted within established controlled work areas.

9.0 Site Control

9.1 General

The purpose of site control is to minimize potential contamination of workers, protect the public from site hazards, and prevent vandalism. The degree of site control necessary depends on the site characteristics, site size, and the surrounding community.

Controlled work areas will be established at each work location, and if required, will be established directly prior to the work being conducted. Diagrams designating specific controlled work areas will be drawn on site maps, posted in the support vehicle or trailer and discussed during the daily safety meetings. If the site layout changes, the new areas and their potential hazards will be discussed immediately after the changes are made. General examples of zone layouts have been developed for drilling and earth moving activities [(e.g., excavating, trenching, etc.) – **post these diagrams as appropriate**] and are attached to this section.

9.2 Controlled Work Areas

Each HAZWOPER controlled work area will consist of the following three zones:

- Exclusion Zone: Contaminated work area.
- Contamination Reduction Zone: Decontamination area.
- Support Zone: Uncontaminated or “clean area” where personnel should not be exposed to hazardous conditions.

Each zone will be periodically monitored in accordance with the air monitoring requirements established in this HASP. The Exclusion Zone and the Contamination Reduction Zone are considered work areas. The Support Zone is accessible to the public (e.g., vendors, inspectors).

9.2.1 Exclusion Zone

The Exclusion Zone is the area where primary activities occur, such as sampling, remediation operations, installation of wells, cleanup work, etc. This area must be clearly marked with hazard tape, barricades or cones, or enclosed by fences or ropes. Only personnel involved in work activities, and meeting the requirements specified in the applicable THA and this HASP will be allowed in an Exclusion Zone.

The extent of each area will be sufficient to ensure that personnel located at/beyond its boundaries will not be affected in any substantial way by hazards associated with sample collection activities.

(See HASP Description and Assistance document for minimum distances examples)

All personnel should be alert to prevent unauthorized, accidental entrance into controlled-access areas (the EZ and CRZ). If such an entry should occur, the trespasser should be immediately escorted outside the area, or all HAZWOPER-related work must cease. All personnel, equipment, and supplies that enter controlled-access areas must be decontaminated or containerized as waste prior to leaving (through the CRZ only).

9.2.2 Contamination Reduction Zone

The Contamination Reduction Zone is the transition area between the contaminated area and the clean area. Decontamination is the main focus in this area. The decontamination of workers and equipment limits the physical transfer of hazardous substances into the clean area. This area must also be clearly marked with hazard tape and access limited to personnel involved in decontamination.

9.2.3 Support Zone

The Support Zone is an uncontaminated zone where administrative and other support functions, such as first aid, equipment supply, emergency information, etc., are located. The Support Zone shall have minimal potential for significant exposure to contaminants (i.e., background levels).

Employees will establish a Support Zone (if necessary) at the site before the commencement of site activities. The Support Zone would also serve as the entry point for controlling site access.

9.3 **Site Access Documentation**

If implemented by the PM, all personnel entering the site shall complete the "Site Entry/Exit Log" located at the site trailer or primary site support vehicle.

9.4 **Site Security**

9.4.1 Site security is necessary to:

- Prevent the exposure of unauthorized, unprotected people to site hazards.
- Avoid the increased hazards from vandals or persons seeking to abandon other wastes on the site.
- Prevent theft.
- Avoid interference with safe working procedures.

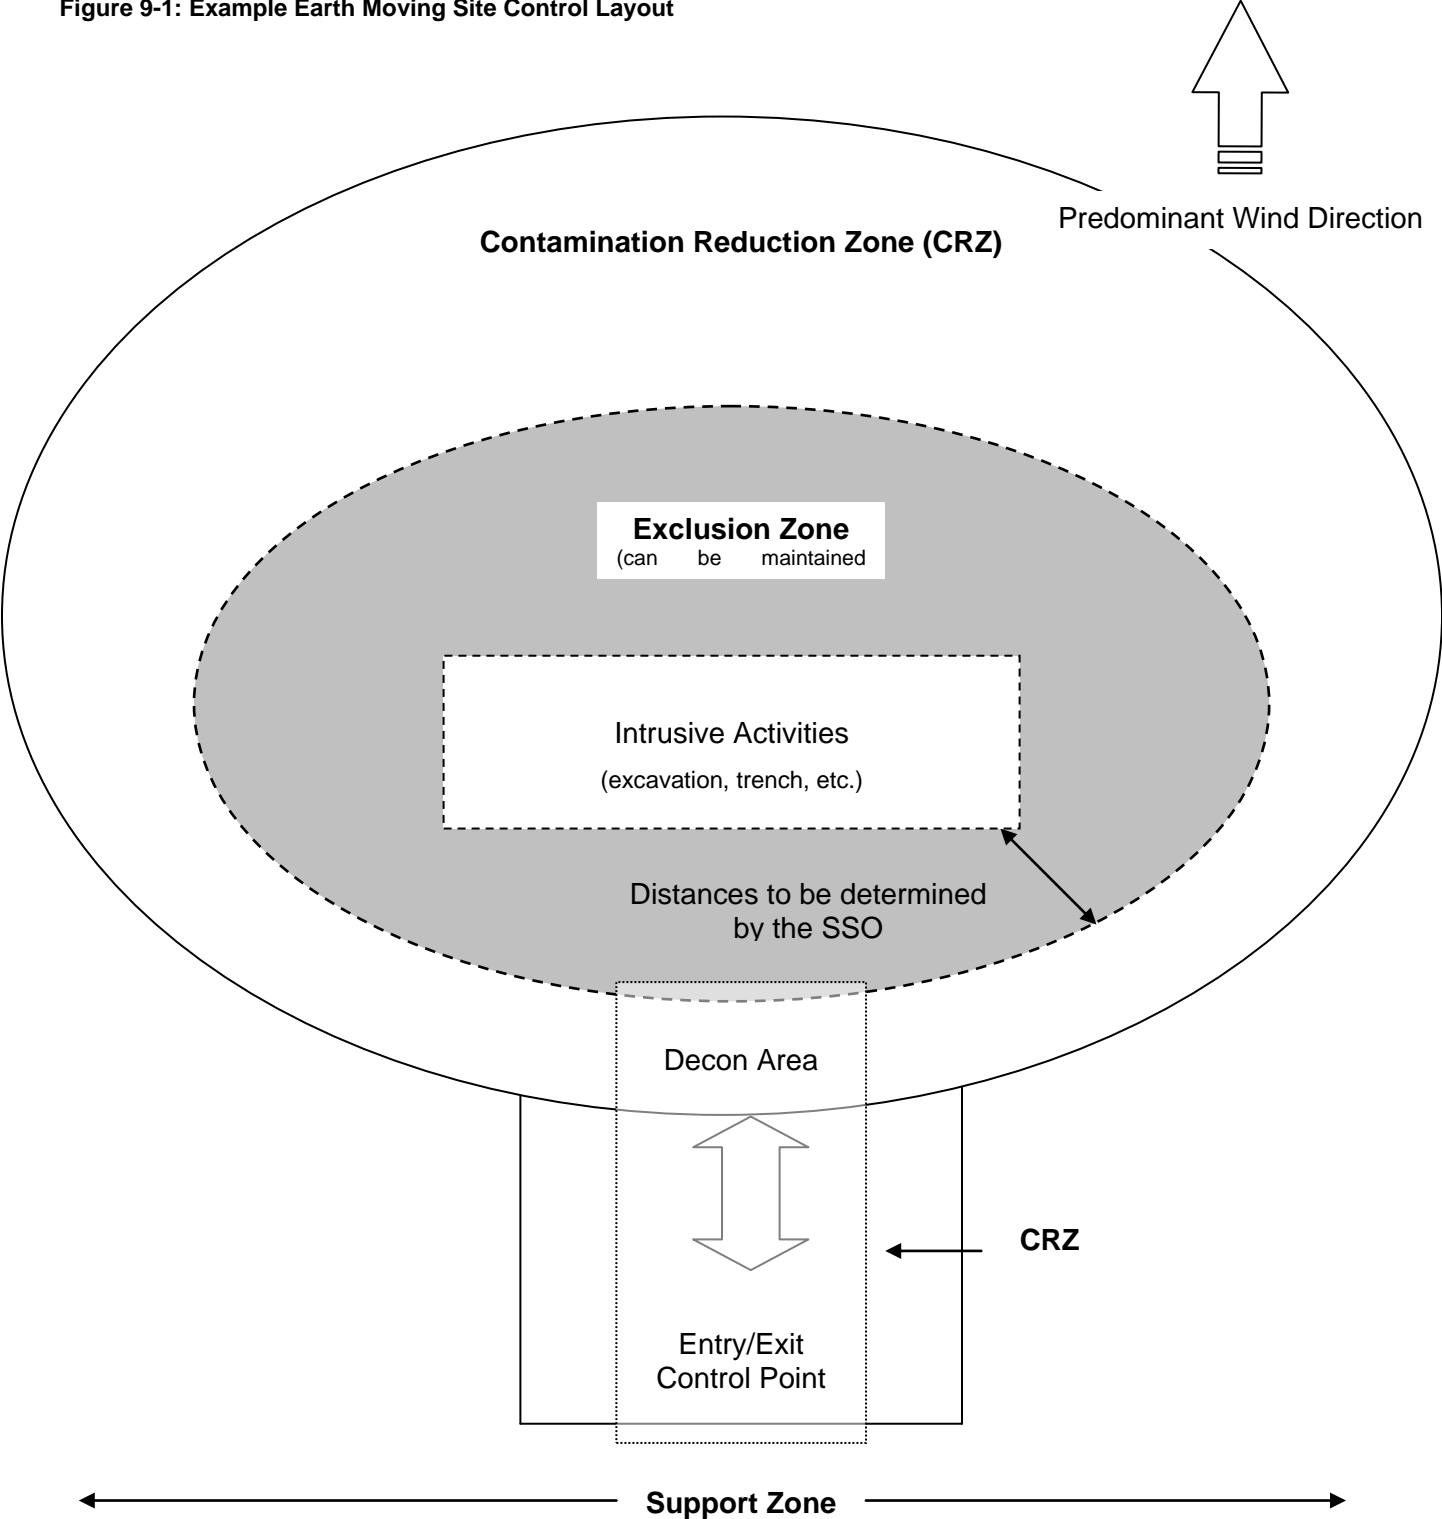

9.4.2 To maintain site security during working hours:

- Maintain security in the Support Zone and at access control points.
- Establish an identification system to identify authorized persons and limitations to their approved activities.
- Assign responsibility for enforcing authority for entry and exit requirements.
- When feasible, install fencing or other physical barrier around the site.
- If the site is not fenced, post signs around the perimeter and whenever possible, use guards to patrol the perimeter. Guards must be fully apprised of the hazards involved and trained in emergency procedures.
- Have the PM approve all visitors to the site. Make sure they have valid purpose for entering the site. Have trained site personnel accompany visitors at all times and provide them with the appropriate protective equipment.

9.4.3 To maintain site security during off-duty hours:

- If possible, assign trained, in-house technicians for site surveillance. They will be familiar with the site, the nature of the work, the site's hazards, and respiratory protection techniques.
- If necessary, use security guards to patrol the site boundary. Such personnel may be less expensive than trained technicians, but will be more difficult to train in safety procedures and will be less confident in reacting to problems around hazardous substances.
- Enlist public enforcement agencies, such as the local police department, if the site presents a significant risk to local health and safety.
- Secure the equipment.

Figure 9-1: Example Earth Moving Site Control Layout

10.0 Emergency Response Planning

10.1 Emergency Action Plan

Although the potential for an emergency to occur is remote, an emergency action plan has been prepared for this project should such critical situations arise. The only significant type of onsite emergency that may occur is physical injury or illness to a member of the AECOM team. The Emergency Action Plan (EAP) will be reviewed by all personnel prior to the start of field activities. A test of the EAP will be performed within the first three (3) days of the project field operations. This test will be evaluated and documented in the project records.

10.1.1 Three major categories of emergencies could occur during site operations:

- Illnesses and physical injuries (including injury-causing chemical exposure)
- Catastrophic events (fire, explosion, earthquake, or chemical)
- Workplace Violence, Bomb Threat
- Safety equipment problems

10.1.2 Emergency Coordinator

The duties of the Emergency Coordinator (EC) include:

- Implement the EAP based on the identified emergency condition.
- Notify the appropriate project and SH&E Department personnel of the emergency (Table 9-3).
- Verify emergency evacuation routes and muster points are accessible.
- Conduct routine EAP drills and evaluate compliance with the EAP.

10.1.3 Site-Specific Emergency Procedures

Prior to the start of site operations, the EC will complete Table 9-1 with any site-specific information regarding evacuations, muster points, communication, and other site-specific emergency procedures.

Table 10-1: Emergency Planning

Emergency	Evacuation Route	Muster Location
Chemical Spill	Upwind [insert distance]	[insert location]
Fire/Explosion	[insert directions]	[insert location]
Tornado	[insert directions]	[insert location]
Lightning	[insert directions]	Vehicle
[insert additional]		
Additional Information		
Communication Procedures	[insert communication procedures, means of alerting personnel, etc.]	
CPR/First Aid Trained Personnel	[insert names]	
Site-Specific Spill	[insert spill response procedures for specific chemicals if required]	

Response Procedures	
----------------------------	--

10.1.4 Spill Containment Procedure

Work activities may involve the use of hazardous materials (i.e. fuels, solvents) or work involving drums or other containers. Where these activities exist, a site-specific Spill Reporting Card [project team must develop the spill reporting card] will be developed (Attachment D). Procedures outlined below will be used to prevent or contain spills:

- All hazardous material will be stored in appropriate containers
- Tops/lids will be placed back on containers after use.
- Containers of hazardous materials will be stored appropriately away from moving equipment.

At least one spill response kit, to include an appropriate empty container, materials to allow for booming or diking the area to minimize the size of the spill, and appropriate clean-up material (i.e. speedy dri) shall be available at each work site (more as needed).

- All hazardous commodities in use (i.e. fuels) shall be properly labeled.
- Containers shall only be lifted using equipment specifically manufactured for that purpose.
- Drums/containers will be secured and handled in a manner which minimizes spillage and reduces the risk of musculoskeletal injuries.

10.1.5 Safety Accident/Incident Reporting

All accidents and incidents that occur on-site during any field activity will be promptly reported to the SSO and the immediate supervisor.

If any AECOM employee is injured and requires medical treatment, the Site Supervisor will report the incident in accordance with AECOM's incident reporting procedures. A copy of the final Supervisor's Report of Incident will be provided to the SH&E Professional before the end of the following shift.

If any employee of a subcontractor is injured, documentation of the incident will be accomplished in accordance with the subcontractor's procedures; however, copies of all documentation (which at a minimum must include the OSHA Form 301 or equivalent) must be provided to the SSO within 24 hours after the accident has occurred.

All accidents/incidents will be investigated. Copies of all subcontractor accident investigations will be provided to the SSO within five (5) days of the accident/incident.

10.1.6 Environmental Spill/Release Reporting

All environmental spills or releases of hazardous materials (e.g., fuels, solvents, etc.), whether in excess of the Reportable Quantity or not, will be reported according to the sequence identified in the *Site-Specific Spill Reporting Card*. In determining whether a spill or release must be reported to a regulatory agency, the Site Supervisor will assess the quantity of the spill or release and evaluate the reporting criteria against the state-specific reporting requirements, your applicable regulatory permit, and/or client-specific reporting procedures. In order to support the Site Supervisor and expedite the decision to report to a state regulatory agency, a site-specific Spill Reporting Card will be developed (Attachment D). **If reporting to a US state or Federal regulatory agency is required, AECOM has 15 minutes from the time of the spill/release to officially report it.**

Chemical-specific Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Reportable Quantities for the known chemicals onsite are shown in Table 10.1.

Table 10.1: CERCLA Reportable Quantities

Hazardous Substance	Regulatory Synonyms	Final RQ (lbs)
Benzene	N/A	10
Trichloroethylene	Trichloroethene, TCE	100
Tetrachloroethylene	Perchloroethylene, PCE	100
[insert additional rows as required]		

[CERCLA RQs can be found at:

S3NA-209-TP2a HASP Assistance

This document will assist the developer of the HASP in creating information for the HASP templates. Each help section is outlined by the required section.

1.0 Scope of Work

Below is a series of tasks typically encountered on projects. Although the text below may be used to describe your work, it must be elaborated on in sufficient detail to make it site specific.

1.1 Mobilization/Demobilization

Mobilization and demobilization represent limited pre- and post-task activities. These activities include driving to and from the site; initial site preparations, such as trailer and toilet facility setup; and post-work activities, such as removing files and office equipment and general housekeeping. Mobilization and demobilization do not represent any intrusive activities. Electrical hook-up and disconnect for office trailers must be performed by a licensed electrical subcontractor. Prior to mobilization, all utility clearance shall be obtained by the authorizing authority for the subject site. If utility locations cannot be verified on site by the public authority, then a private utility location contractor may need to be utilized to confirm/deny the presence of private underground utilities on the site.

1.2 Site Preparation

Site preparation includes construction and maintenance of temporary access roads and construction area entrances, installation of silt fence around the perimeter of disturbance areas, and installation of berms to facilitate the use of existing drainage features and structures. Other pre-work activities, such as the stockpiling of backfill materials, utility mark-out and clearance, and the setup of other work support items are included as well. Other site preparation activities will include the verification of utility mark-outs and presence of the clear dig permits (on site). Typically, the lead time for a clear dig permit is three days, and the permit is generally valid for 10 days. Consult the specific clearance dates associated with the permit obtained for the site.

1.3 Clearing and Grubbing

Clearing and grubbing involves the removal of trees and vegetation and their root systems. The limits of clearing and grubbing will extend approximately 10 feet beyond the perimeter of the areas specified in the work plan. Clearing will involve the cutting of standing timber and the removal of brush-utilizing chainsaws, brush hogs, and chippers. Grubbing will be performed using a dozer and/or hydraulic excavator. All cut and chipped vegetative material will be placed in roll-off boxes for offsite disposal.

1.4 Groundwater Sampling

Groundwater sampling includes the collection of groundwater samples from existing monitoring well networks, temporary Geo-probe points, and new monitoring wells. Groundwater samples will be collected through low-flow sampling techniques using submersible pumps. During groundwater collection, appropriate air monitoring will be conducted and the appropriate chemical-resistant PPE will be worn to protect against exposure. The major activities involved with collecting groundwater samples from the site and surrounding properties include the following:

- Presampling event notifications and approval.
- Setup for sampling activities.
- Groundwater samples from monitoring wells collected using low-flow sampling techniques.
- Sample prep and sample shipping.
- Administrative activities.

1.5 Surface Water Sampling

This activity will include the collection of samples from surface water from[....]. Water samples are collected from effluent collection points accessible from the ground surface. During water collection, the appropriate chemical-resistant PPE will be worn to protect against exposure as well as the PPE prescribed. The major activities involved with collecting samples from the site and surrounding properties include the following:

- Presampling event notifications and approval.
- Setup for sampling activities.

- Samples collection from a body of surface water (Shenandoah River, intermittent stream, pond).
- Sample prep and sample shipping.
- Administrative activities.

1.6 Soil Sampling

Soil samples will be collected from Geo-probe points and during well installation activities. During sampling activities, appropriate air monitoring will be conducted and the appropriate chemical resistant PPE will be worn to protect against exposure. The major activities involved with collecting samples from the site and surrounding properties include the following:

- Presampling event notifications and approval.
- Setup for sampling activities.
- Soil sample collection during well installation activities using HSA drilling techniques or from Geo-probe points.
- Sample prep and sample shipping.
- Administrative activities.

1.7 Sub-slab Vapor Sampling

Two rounds of sub-slab vapor samples, co-located with indoor air samples, will be collected from underneath the slabs of 20 buildings listed in Table 2-1 using 6L Summa® canisters. The sub-slab vapor samples will be sent to a fixed laboratory to obtain definitive data. Definitive data will be produced by using standard methods in a fixed laboratory. The major activities involved with collecting samples from the site include the following:

- Presampling event notifications and approval.
- Setup for sampling activities.
- Air samples will be collected as needed and will consist of ambient air sampling. Summa® canisters are the expected sampling container.
- Sample prep and sample shipping.
- Administrative activities.

1.8 Indoor Air Sampling

Indoor air samples may be collected from buildings on-site or nearby the site. Air samples will be collected as-needed and will consist of ambient air sampling. Suma canisters are the expected sampling container. The major activities involved with collecting samples from the site and surrounding properties include the following:

- Presampling event notifications and approval.
- Setup for sampling activities.
- Air samples will be collected as needed and will consist of ambient air sampling. Suma canisters are the expected sampling container.
- Sample prep and sample shipping.
- Administrative activities.

1.9 Installation and Abandonment of Sub-Slab Vapor Sampling Points

Sub-slab vapor monitoring points will be permanently installed at one location for each of the 20 buildings listed in Table 2-1. Care will be taken to identify locations where the concrete floor is accessible (not covered with tile or carpet). Asbestos tile was identified during the site visit; sampling locations will be adjusted to avoid installation of monitoring points in those locations.

The monitoring points will be installed by drilling a hole in the concrete slab, installing a small amount of filter pack sand, inserting an stainless steel tube fitted with a female threaded swagelok® and sealing the tube into the drill hole with VOC-free modeling clay. The monitoring point will be completed with hydraulic cement and set flush with the surrounding floor surface. A hex-head bolt will be screwed into the fitting to seal the sampling point.

1.10 Temporary Boring and Well Installation Oversight

AECOM personnel will perform oversight for the installation of temporary borings installed using a Geo-probe rig and monitoring wells using hollow-stem auger (HSA) or air rotary drilling methods. A drilling subcontractor (TBD) will be utilized for the installation of monitoring wells (4-inch PVC typical) to a predetermined depth utilizing a HAS drill and/or air rotary drill rig. The major activities involved with the installation of a monitoring well or a temporary boring are as follows:

- Pre-sampling event notifications and approval.

- Set-up for boring/well installation.
- Monitor air quality in the workers breathing zone.
- Log soils and screen with a PID.
- Sample collection using encore or bulk sampling.
- Administrative activities.

1.11 Well Abandonment Oversight

AECOM personnel will be performing the oversight for well abandonment to be performed by a drilling subcontractor (TBD). The major activities involved with abandoning a well are

- Setting up for well abandonment.
- Removing stick-up or flushmount casing, including concrete pad.
- Pulling the well casing from the ground with drill rig or over-drill.
- Filling the well with grout.

1.12 Operations and Maintenance of GW Treatment System

AECOM personnel will conduct operation and maintenance activities at the ABC Groundwater Treatment facility for the remediation of TCE- and PCE-impacted groundwater. Activities include pump/line repair and replacement, well head checks, acid/caustic deliveries, and periodic groundwater monitoring activities within the established monitoring well network. A minimum of two technicians will be on site during O&M activities.

1.13 Underground Storage Tank Removal

Tank Removal (oversight) activities are anticipated to be conducted on approximately 23 of the 27 individual locations. Tasks included under this SOW item include removal of surface cover (asphalt, concrete), cleaning of the tank interiors, physical tank removal, and backfilling activities. The tanks will be inerted and removed from the ground, tank exteriors will be cleaned, and tanks will be rendered unusable and will be transported off site for further disposition. Confirmation sampling of the tank pits will be performed to determine the need for contaminated soil removal.

1.14 Excavation of Contaminated Soils

AECOM will excavate and dispose impacted soils off site using an excavator and direct loading into roll-off or other approved containers for off-site transportation and disposal. The impacted materials will be placed into lined/covered roll-offs and will be temporarily staged on site prior to transportation to the disposal facility. Equipment operators will be supported by a crew of technicians who will perform spotting activities, provide traffic control, the securing of roll-off containers, and general housekeeping activities on the site. Additional confirmation sampling of the excavation will be performed under this task as well.

1.15 Investigative-Derived Waste (IDW) Management

IDW will be collected and categorized as nonhazardous or hazardous. Potentially hazardous IDW (purge water, decontamination fluids, soil cuttings, if any) will be tested and disposed of within 90 calendar days of completing the field activities. Potentially hazardous IDW waste will be staged onsite, then delivered to an IDW storage facility for processing. Nonhazardous IDW (normal trash) will be disposed of in a timely fashion during fieldwork. Drum handling and drum sampling activities may take place under this task.

1.16 Equipment Decontamination

AECOM and subcontractor personnel will perform decontamination of equipment used to perform work within controlled work areas. Decontamination procedures could range from dry-brush techniques, to wet methods (rinse/wash), to steam cleaning as determined by the type of operation being conducted. Please detail-out the anticipated decon methods for the site.

Before any drilling is begun and at the completion of drilling, the drilling subcontractor shall decontaminate the drill rig, casing, samplers, and all other drilling equipment that will be used on site. The drilling subcontractor shall provide a high-pressure steam cleaner for decontamination of all downhole drilling equipment. The drill rig shall be steam cleaned between drilling at each site. Soil sampling equipment shall be decontaminated between each use, using a phosphate-free detergent and potable water in accordance with ASTM D 5088. The drilling subcontractor shall construct a temporary decontamination pad to contain all decontamination water generated during decontamination of drill rigs and tools.

And/or:

Pre-cleaned and dedicated sampling materials/equipment will be used to collect soil and groundwater samples for laboratory analysis. After the samples are collected, any disposable or one-time use equipment (tubing, bladders)

will placed in a plastic bag for disposal in accordance with the paragraph above. Nondisposable sampling and drilling equipment that has the soil and/or groundwater will be decontaminated between each sampling location. Gross sediments and/or contamination will first be removed from the sampling and drilling equipment. The equipment will then be washed with DI water and Alconox detergent and then rinsed with DI water, methanol, etc.

1.17 Site Restoration

Site restoration will involve the removal of temporary roadways and staging areas, final grading of the site, surface cover installation (asphalt and concrete placement, topsoil, seeding, mulching, tree planting, and other landscaping), removal of temporary fencing and erosion control materials, and the disposal of construction debris.

2.0 Physical Hazards

Below is a series of tasks typically encountered on projects. While the text below may be used to describe your work, it must be elaborated on in sufficient detail to make it site specific.

2.1 Slips, Trips, Falls, and Protruding Objects

A variety of conditions that may exist may result in injury from slips, trips, falls, and protruding objects. Slips and trips may occur as a result of wet, slippery, or uneven walking surfaces. To prevent injuries from slips and trips, always keep work areas clean; keep walkways free of objects and debris; and report/clean up liquid spills. Serious injuries may occur as a result of falls from elevated heights. Always wear fall protection while working at heights of 6 feet or greater above the next lower level. Protruding objects are any object that extends into the path of travel or working area that may cause injury when contacted by personnel. Always be aware of protruding objects and when feasible remove the protruding object or label it with an appropriate warning.

2.2 Housekeeping

During site activities, work areas will be continuously policed to identify excess trash and unnecessary debris. Excess debris and trash will be collected and stored in an appropriate container (e.g., plastic trash bags, garbage can, roll-off bin) prior to disposal. At no time will debris or trash be intermingled with waste PPE or contaminated materials. Additional information on the requirements of housekeeping[...].

2.3 Manual Lifting

Most materials associated with investigation and remedial activities are moved by hand. The human body is subject to severe damage in the forms of back injury, muscle strains, and hernia if caution is not observed in the handling process. Whenever possible, use mechanical assistance to lift or move materials and, at a minimum, use at least two people to lift or roll/lift with your arms as close to the body as possible.

2.4 Utilities

Various forms of underground/overhead utility lines or pipes may be encountered during site activities. Prior to the start of intrusive operations, utility clearance is mandated, as is obtaining authorization from all concerned public utility department offices. If insufficient data is available to accurately determine the location of the utility lines, AECOM will hand clear to a depth of at least 5 feet below ground surface in the proposed areas of subsurface investigation. Should intrusive operations cause equipment to come into contact with utility lines, the SSO and an AECOM SH&E Professional will be notified immediately. Work will be suspended until the applicable utility agency is contacted and the appropriate actions for the particular situations can be taken. The phone number for the applicable state agency is provided in the Emergency Contacts list.

Ensure that backhoe operators, truck drivers, etc. and the signal person are aware of overhead power lines when working around overhead power lines. Overhead power and utility lines may be present on, or adjacent to, the site and represent a potential hazard during the mobilization/demobilization of equipment and supplies. Maintain a minimum of 10 feet between overhead power lines and the bucket and/or arm of the backhoe bed/cab of trucks, etc. Any deviation must be approved by the Regional SH&E Manager. Additional information on working adjacent to overhead power and utility lines[...].

2.5 General Electrical Hazards

Electrical and powered equipment may be used during a variety of site activities. Injuries associated with electrical and powered equipment include electric shock, cuts/lacerations, eye damage (from flying debris), and burns. To reduce the potential of injury from the hazards associated with electrical and powered equipment, always comply with the following:

- Use ground fault circuit interrupters (GFCIs) when using electrical powered tools/equipment. GFCIs prevent electrical shock by detecting the loss of electricity from a power cord and/or electrical device.
- Confirm that generators are properly grounded, including the use of a grounding rod driven to a depth of 3 feet.
- Wear ANSI-approved (Z87.1) safety glasses. Face shields may be required to provide additional face protection from flying debris.
- Wear appropriate work gloves. Work gloves may reduce the severity of burns and cuts/lacerations.

All temporary electric installations (site trailer, subpanels) will comply with OSHA (29 CFR 1926, Subpart K, and 29 CFR 1910, Subpart S) guidelines. Only qualified and competent individuals (licensed electrician) will provide electrical service/servicing. Refer to SH&E 712, *Hazardous Energy Control*, for additional requirements and information.

2.6 Hazardous Energy

Use lockout/tagout procedures when performing maintenance or repairs on equipment.

It is the responsibility of AECOM employees to verify that all remediation equipment is locked out before AECOM employees perform any maintenance or repair work on the system. The source must be locked out; it is not enough to push the power switch to off and disconnect the breaker. Anyone can re-engage power under these circumstances. Locking out the power source is the only way to guarantee that the power will not be inadvertently reactivated.

A lock-out/tag-out kit will be located in the treatment shed for the duration of the project. The kit includes standard locks, keys, and lock-out notices.

The site specific lock-out/tag-out information must be completed for both the groundwater containment system and the SSD system. These forms will then be placed within the remediation trailer so all field technicians performing operations and maintenance work on the system are familiar with how to lock out the system when necessary.

2.7 Heavy Equipment and Vehicle Operations

Heavy equipment and site vehicles present serious hazards site personnel. Blind spots, failure to yield, and other situations may cause heavy equipment/vehicles to come into contact with personnel. To reduce the possibility of contact between equipment/traffic and personnel, always adhere to the following:

- Personnel must wear a high-visibility, reflective safety vest at all times when working near heavy equipment and/or other vehicle traffic.
- Personnel must always yield to equipment/vehicle traffic and stay as far as possible from all equipment/vehicle traffic. Always maintain eye contact with operators.
- When feasible, place barriers between work areas and equipment/vehicle traffic.
- Always ensure that reverse warning alarms are working and louder than surrounding noise. Personnel must report inoperative reverse warning alarms.
- Confirm Daily Equipment Safety Inspections are being performed and that documentation is filed at the site.

2.8 Drilling Operations

Drilling operations, including hollow-stem, rotary and/or direct push drilling, present their own set of hazards. Several basic precautions that should be taken include, but are not limited to, confirming locations of underground and overhead utilities, wearing of appropriate PPE and the avoidance of loose clothing or jewelry, staying clear of moving parts, and knowing the locations of emergency shut-off switches. Other operational safety precautions regarding moving the drilling equipment, raising and lowering the derrick(mast), and drilling may be required.

2.9 Excavations and Trenches

Excavations and trenches present workers with a variety of hazards. If not properly sloped, shored, or boxed, trench walls may collapse and trap workers under the weight of the soil. Soil contaminants and other chemical hazards (e.g., carbon monoxide from equipment/vehicles) may result in a hazardous atmosphere. Confined space entry procedures may need to be followed if the potential for a hazardous atmosphere exists. Buried utilities may exist where excavations/trenches will be placed. Always contact the local utility locator service prior to beginning excavations.

2.10 UST Removal

Although AECOM employees do not actually perform underground storage tank removal operations, they may oversee or be present during the removal or closure of underground storage tanks by contractors or subcontractors. It is therefore important that AECOM employees be aware of the hazards associated with and the safe work procedures for performing underground storage tank removal. Safety measures should include confirming locations of underground and overhead utilities, heavy equipment operations awareness, excavation safety awareness, and basic UST removal procedures such as tank cleaning, inerting, physical removal, and load-out procedures.

Only experienced, demonstrably proficient, equipment operators will be used to operate such heavy equipment as backhoes, front-end loaders, cranes, etc. Where certification or licensing requirements exist, such personnel shall possess appropriate certification and/or licensing for operating specified heavy equipment. Because of the potential cave-in and atmospheric hazards, entry into the underground storage tank excavation should be avoided at all costs. Soil samples from the excavation should be collected with a remote sampling device or from the bucket of the backhoe whenever possible. Before initiating work in the tank area or on the tank, air monitoring must be performed to assess flammable vapor concentrations in the tank and the surrounding work area. For the

purposes of this SOP, atmospheres that are measured and found to contain flammable gases or vapors at concentrations greater than 10% of the LEL of flammable gas or vapor shall be considered flammable.

2.11 Elevated Work Platforms and Aerial Lifts

The use of aerial lifts presents a unique set of hazards to employees using and working around the equipment. Proper training on the safe usage of the specific type of lift being utilized is essential to the safe execution of work tasks with the equipment. Besides the daily inspections and safe usage of the equipment, numerous other safety related issues—including fall protection, safe working surfaces, and overhead power lines—need to be assessed.

2.12 Working at Heights

The following are US standards. Fall Protection Systems shall comply with OSHA Regulations (Standards – 29 CFR) Standard # 1926.502 Fall Protection Systems Criteria and Practices and OSHA Standard # 1926.502(d) – 1926 Subpart M App C Personal Fall Arrest Systems.

Specifically, anyone working in an area exposed to a fall greater than 6 feet must use appropriate fall protection. Such protection includes: guardrail systems, safety net systems, or personal fall arrest systems. Other protection methods include hole covers, positioning devices, equipment guards, fences, and barricades. Fall protection shall be provided as required in OSHA Regulations 29CFR1910 and 29CFR1926, reference: standard 1926.501 Duty to Have Fall Protection.

Work above a height of 6 feet requires a fall protection system. This project requires 100 percent tie-off using full-body harness (Class III or IV) with dual shock-absorbing lanyard (shorter than fall distance and a maximum of 6 feet long) equipped with double-locking hooks connected to a proper tie-off attachment point capable of handling potential fall loads of 5,000 pounds.

Fall protection systems classified as “job made” (not purchased, approved fall prevention devices from a fall protection supplier) shall be designed by a Registered Professional Engineer. Fall protection or restraining methods shall be in place when employees are within 6 feet of the leading or exposed edge, where a fall hazard exceeding 6 feet exists, such as during decking activities, inspecting structures, climbing, trenching, etc.

2.13 Working On or Near the Water

The buddy system should be utilized whenever there is the possibility of falling into water. In the buddy system, two persons operate as a single unit in order to monitor and assist each other in performing tasks. Whenever the possibility of falling into water exists, personnel must be attired in a USCG-approved Type III or Type V work vest. The vest must be properly sized for the individual and must be secured at all times. A throwable rescue device (Type IV flotation aid), along with other appropriate equipment (i.e., ladders, lifting gear, or rescue boat), shall be immediately available to recover an individual from the water.

Waders may not be worn when working along, over, or in moving waters; or in waters influenced by tides or acted upon by waves when water depths exceed knee height unless specifically approved by the SH&E Manager. Waders may be worn in still waters in water depths up to the waist if bottom conditions are firm and well understood. Waders shall never be worn aboard a watercraft of any kind.

Use a pole to conduct sediment probing to assess water depths, the stability of shoreline terrain, and the bearing capacity of bottom sediments ahead of the chosen path. If workers have the potential to get stuck in mud or fluidized sediment, air injection equipment designed to free workers’ feet/legs may need to be available on site. At a minimum, a safety line should be available to be deployed from safe ground. If a worker does get stuck, he or she should not struggle as this causes further sinking.

Take special care on slippery rocks along shorelines, lakeshores, riverbanks, and creeks. Always look ahead at the ground when walking around the water’s edge and avoid stepping on stones that have algal growth, especially those in intertidal areas, as these are extremely slippery. It is suggested that workers not be permitted to access areas where these slip/fall hazards exist, especially in locations containing tidal water flow.

2.14 Working Near Railroad Hazards

When working on or near “live” tracks, follow these general rules:

Hard hats (preferably orange), high visibility apparel, and safety footwear shall be worn on railroad right-of-way. All other owner/operator safety requirements and procedures shall be followed.

Red markers, flagging, or lights shall not be used on railroad right-of-way. Red means “immediate danger,” and trains that encounter red markers will stop without exception. Red signals shall only be used when injured persons or disabled vehicles are on the tracks or at grade crossings and cannot be moved or when any condition could cause derailment.

Train schedules cannot be relied upon. Passenger trains have published schedules but are often off schedule. Freight trains have no schedules, and move anyplace, anytime.

When tracks must be crossed, look in both directions every time. When crossing more than one set of tracks, stop after the first set and look again each way before crossing the second set. Air build-up can cause a train to “jump” forward; therefore, do not cross directly in front of a standing train. Do not lean on or crawl under stopped cars or cross tracks between cars.

Railroad equipment is not always heard, especially if there is other noise. Coasting, slow-moving trains may give no warning.

Notify the flagger each time it is necessary to “foul” the tracks, and then proceed only after “absolute protection” is received. Efforts to clear tracks must begin immediately anytime the flagger indicates to do so.

For jobs longer than one day, the flagger and project supervisor shall discuss the day’s work and any need to foul the tracks at the start of each work day. Discuss job details with each new flagger.

Be alert for buried electrical/utility lines on or near railroad right-of-way. Excavations on the right-of-way shall be filled at the end of each day.

Access roads to and across tracks shall not be blocked or disrupted. Vehicles shall not be parked within 10 feet of the tracks. Materials, tools, or equipment shall not be stored on railroad right-of-way. Track ballast shall not be eroded or contaminated. Work areas shall be inspected after each day’s work to ensure that nothing is left on or near the tracks. Appropriate lighting devices shall be used to protect the work area overnight.

It is also important to note that trains and cars in the hump yard area may be under remote operation. Exercise extreme caution when working in these areas as there may be no engineers aboard these trains and cars.

2.15 Dust and Odor Control

Specific controls will be in place to prevent dust generation. If dust is observed reaching or approaching the site boundary, activities causing the dust will be immediately stopped. Dust control measures (water spray, soil covers, slower work pace, or change in work activities) will be deployed prior to resuming work. Corrective measures will be documented in the daily report.

Because of the nature of the contaminant at the site, odors are not likely to be anticipated to be of concern. In the event that an odor complaint is received, the SS and/or SSO will immediately assess site conditions and will determine the probable cause or causes. Appropriate odor mitigation measures will be deployed. These measures may include covering sediment piles, deploying odor suppressing foam, implementing air monitoring, or discontinuing activities that are generating the odor. Corrective measures will be documented in the daily report.

2.16 Spill Prevention

Work activities may involve the use of hazardous materials (i.e. fuels, solvents) or work involving drums or other containers. The following procedures will be used to prevent or contain spills:

- All hazardous material will be stored in appropriate containers
- Tops/lids will be placed back on containers after use.
- Containers of hazardous materials will be stored appropriately away from moving equipment.

At least one spill response kit, including an appropriate empty container, materials to allow for booming or diking the area to minimize the size of the spill, and appropriate clean-up material (e.g., speedy dri) shall be available at each work site (more as needed).

All hazardous commodities in use (e.g., fuels) shall be properly labeled.

Containers shall only be lifted using equipment specifically manufactured for that purpose.

2.17 Noise Exposure Monitoring

[specify if necessary]

When heavy equipment is in operation, it will be necessary to ensure that each exclusion zone fully encompasses all areas where hazardous noise levels are present (85dBA or greater). Once each work day, the SSO will use a sound level meter to survey the perimeter of each exclusion zone while all onsite heavy equipment within the zone is being operated simultaneously. If the sound pressure level exceeds 85 dBA at any location along the site perimeter, the SSO will exit the exclusion zone and use the meter to determine the 85 dBA limit. The exclusion zone boundary will then be adjusted to fully encompass this region.

2.18 Traffic Control

During certain work tasks, the establishment of traffic control to adequately protect workers and the public may be required on-site. Site-specific requirements will be determined by the site supervisor/SSO on a case-by-case basis. Only approved traffic control devices in accordance with the Manual of Uniform Traffic Control Devices (MUTCD) will be used on public road ways per accordance with the applicable state regulatory guidance.

General traffic control precautions include placing a work vehicle between your worksite and oncoming traffic whenever possible. Not only is it a large, visible warning sign, but also if an oncoming car should fail to yield or deviate, the parked vehicle rather than your body would absorb the first impact of a crash. Turn the vehicle wheels so that if the vehicle were struck it would swing away from the worksite. When using cones or other devices to modify traffic flow, ensure use of the proper taper length and device spacing to provide adequate warning distance to oncoming motor vehicles. In addition, proper PPE, including a hardhat and a high-visibility vest shall be worn during traffic operations.

3.0 Wildlife, Plant, and Insect Hazards

Below is a series of tasks typically encountered on projects. While the text below may be used to describe your work, it must be elaborated on in sufficient detail to make it site specific.

3.1 Bears

An encounter with a bear of any species can have a wide variety of outcomes, ranging from a simple sighting, to a false charge, to a serious mauling or even death. Consequently, the risk of a bear encounter must be taken very seriously.

The hazard or risk associated with a bear encounter varies significantly depending on the location. It is important to research the project area before field work commences to determine the expected probability of encountering a bear. Remoteness from urbanized areas should not be a criteria, as bears have been encountered within city limits, especially near landfills.

The risk associated with a bear encounter also varies with the species of bear, the season, and the circumstances under which the bear is encountered.

Preparing staff for any type of encounter is key to managing the risk.

3.2 Small Mammals

Working in the field either directly or indirectly with small mammals has an inherent risk of injury or exposure to zoonotic diseases (infectious diseases that can be transmitted from animals to humans) against which all field staff need to protect themselves.

This risk is usually higher when there is direct contact with a wild animal, either through a break in the skin (blood), saliva, or excrement; however, air-borne diseases (e.g., Hantavirus) also pose a risk.

Obviously, wildlife biologists directly handling wildlife, dead or alive, or working with wildlife feces or in enclosed habitats (such as caves), have an increased risk of exposure to a wider range of zoonotic diseases and should take extra precautions.

3.3 Venomous Animals

Some animals have the ability to inject venom. These include rattlesnakes, black widow spiders, and scorpions, all of which have limited distributions and therefore are unlikely to be encountered in most areas. Other spiders possess venom but they are not potentially lethal to humans. Shrews have poisonous saliva, but the chance of being envenomated by them is extremely unlikely unless they are handled.

If bitten by any of these animals, special care should be taken to treat the wound as it may lead to complications due to the toxin.

A bite from a venomous snake, which may inject varying degrees of toxic venom, is rarely fatal but should always be considered a medical emergency.

3.4 Poisonous Plants

Sensitivity to toxins generated by plants, insects, and animals varies according to dosage and the ability of the victim to process the toxin; therefore, it is difficult to predict whether a reaction will occur or how severe the reaction will be. Staff should be aware that a large number of organisms are capable of causing serious irritations and allergic reactions. Some reactions will only erupt if secondary exposure to sunlight occurs. Depending on the severity of the reaction, the result can result in severe scarring, blindness, or even death.

S3NA-302-PR Electrical, General

1.0 Purpose and Scope

- 1.1 To minimize and control electrical hazards in the workplace.
- 1.2 This procedure applies to all AECOM North America-based employees and operations.
- 1.3 As a general rule, AECOM employees should not work on exposed, energized systems with a potential greater than 50 volts. This work should be subcontracted to a qualified electrician. Should it be necessary for an AECOM employee to perform work on exposed, energized systems with a potential greater than 50 volts, the requirements of this procedure will be followed.

2.0 Terms and Definitions

- 2.1 **Arc Rating:** The maximum incident energy resistance demonstrated by a material prior to breakdown or at the onset of a second-degree skin burn (expressed in cal/cm²).
- 2.2 **Arc Flash:** A dangerous condition associated with the release of energy during an electrical arc.
- 2.3 **Arc Flash Analysis:** A mathematical determination of the energy released by an electric arc and the distance from the source that a flash hazard exists. The process for an Arc Flash Analysis is defined in NFPA 70E of the National Electric Code.
- 2.4 **Circuit Protective Device:** A load-rated switch, circuit breaker, or other device specifically designed as a disconnecting means for opening, reversing, or closing of live circuits.
- 2.5 **Energized Electrical Equipment:** Electrically connected to or having a source of voltage.
- 2.6 **Flash Hazard:** A dangerous situation associated with the release of energy caused by an electric arc.
- 2.7 **Ground Fault Circuit Interrupter (GFCI):** An electrical device that protects the users of all devices connected to it from electrical shock. The GFCI is part of the circuit or device in use and continuously measures the current in that circuit. If a leakage of current is detected, as in the case of an electrical short circuit, the circuit is opened at the GFCI and current cannot flow beyond the GFCI.
- 2.8 **Hazardous Atmospheres:** Areas that contain or may contain explosive or flammable atmospheres require specific electrical precautions. OSHA regulates the use of electrical devices in explosive atmospheres according to National Electrical Code criteria and classifications for hazardous atmospheres.
- 2.9 **Portable Electric Equipment:** Cord- and plug-connected equipment and extension cords.
- 2.10 **Qualified Persons:** Individuals who have specific and documented training to avoid the hazards of working on or near energized electrical equipment and have been specifically permitted to work on or near exposed energized and parts.
- 2.11 **Shock Hazard:** A dangerous situation associated with the possible release of energy caused by contact or approach to live parts.
- 2.12 **Unqualified Persons:** Individuals with little or no training to avoid the hazards of energized electrical parts or equipment.

3.0 Attachments

- 3.1 S3NA-302-FM Energized Electrical Work Permit
- 3.2 S3NA-302-ST Electrical Regulations
- 3.3 S3NA-302-WI1 Electrical Safe Work Practices
- 3.4 S3NA-302-WI2 Ground Fault Protection Safe Work Practices
- 3.5 S3NA-302-WI3 Generator Safety Card

4.0 Procedure

4.1 Roles and Responsibilities

4.1.1 Project Manager (Field Task Manager, Supervisor)

- The **Manager** of any **employee** performing work on exposed, energized systems above a potential of 50 volts will be trained to the same level as a Qualified Person (1910.332).
- The AECOM **Project Manager, Field Task Manager, or Supervisor** is responsible for determining if AECOM employees are exposed to electrical hazards.
- The **Manager or Supervisor** will determine the appropriate safe guards to be put in place to protect employees.
- The **Manager or Supervisor** will confirm that only Qualified Persons are assigned duties that expose them or others to live electrical current above 50 volts.

4.1.2 Region\District SH&E Manager is responsible for the following:

- Approving all Energized Electrical Work Permits.
- Providing technical guidance in support of this procedure.

4.1.3 Site Safety Coordinator shall assist the site manager/supervisor in compliance with the requirements of this procedure.

4.1.4 Employees

- All AECOM **employees** engaged in project field activities shall follow these procedures.
- AECOM **employees** will stop work if workers, other than Qualified Persons, are exposed to live electrical systems at unknown voltages or potentials greater than 50 volts
- No staff shall open electrical panels unless they are a Qualified Person.

4.2 Training

4.2.1 Employees who have potential exposures to electrical hazards, Qualified Persons, shall be trained in and be familiar with the electrical safety-related work practices required by the applicable regulations.

4.2.2 All other on-site personnel, Unqualified Persons, will be advised of the electrical hazards and the procedures to mitigate their risk.

4.3 General Requirements for Use of Electricity

4.3.1 AECOM personnel who meet the requirements of a Qualified Person and have been specifically designated as such in the project health and safety plan may set up temporary circuits up to 240 volts. Maintenance or installation of circuits over 240 volts will require professionally trained personnel (i.e. professional electricians).

4.3.2 All electrical panels, lines, equipment, and facilities are to be considered energized unless confirmation that they are de-energized can be obtained from a Qualified Person or electrician.

4.3.3 All work on de-energized systems will be performed using established Hazardous Energy Control procedures. Lockout devices will be used to prevent the operation/energizing of equipment or circuits during maintenance or other work. Tagout devices will be used only where it is not feasible to use a lockout device.

4.3.4 Insulated tools and electrical handling equipment shall be inspected prior to use to confirm that their protective properties are not damaged. Damaged equipment will be tagged "DAMAGED" and removed from service.

4.3.5 S3NA-302-W11 *Electrical Work Safe Work Practices* outlines additional requirements for working on live electrical systems located on AECOM job sites. All work on exposed, energized electrical systems at potentials above 50 volts will be approved by the **Region or District Safety Manager**

4.4 General Requirements for Field/Worksite Use of Electricity

4.4.1 Electrical outlets utilized to supply power for electrical equipment during field operations shall be of the three-wire grounding type. Whenever possible, they should be tested for correct polarity and adequacy of the ground with a circuit analyzer. If it is determined that the outlet is incorrectly wired or inadequately grounded, it should not be used.

- 4.4.2 Ground Fault Circuit Interrupter (GFCI) devices will be in place between the equipment and power source for all temporary circuits unless protected by an assured equipment grounding program as defined in this procedure and *S3NA-302-WI2 Ground Fault Protection Safe Work Practices* (i.e., circuits that are not part of a permanently installed facility electrical system, such as on a construction site or temporary field installation).

4.5 **Distribution System Setup**

- 4.5.1 Only qualified personnel shall perform electrical wiring or connections.
- 4.5.2 Under no circumstances shall electrical lines be routed through doorways, hatches, windows, or other openings where lines could be crimped, bent, or cut.
- 4.5.3 Electric lines crossing work areas, personnel, or vehicular traffic areas shall be either fastened securely overhead (at a height that provides safe clearance for work operations), or protected by a cover capable of withstanding the imposed loads without creating a trip hazard.
- 4.5.4 Circuit breakers shall be labeled to indicate their use.
- 4.5.5 All circuit breaker panels shall be kept covered when not in use.
- 4.5.6 A fuse puller shall be used to remove cartridge fuses where one or more energized circuits are present.
- 4.5.7 All live parts of electrical equipment operating at 50 volts or more shall be properly guarded against accidental contact, which includes:
- Limit access to the equipment to qualified employees only.
 - Unqualified Persons shall remain at least one meter (three feet) from exposed, energized systems managed by AECOM Qualified Persons. This distance shall be nine meters (10 feet) for systems with a potential greater than 240 volts.
 - Label using the proper accident prevention sign, stating DANGER as well as the voltage of the equipment.
 - Provide a conductor of the ampacity of not less than the rating of the circuit breaker or fuses protecting that circuit.
 - Confirm that a bare conductor or earth return is not used for any temporary circuit.
 - Confirm that all electrical wiring is protected from physical damage by covering and by not placing it in a location where it can be crimped or cut, etc.
- 4.5.8 **Extension Cord Use**
- Extension cords and electrical connections on handheld and other power tools will be inspected prior to use for cuts, kinks, frayed wires, etc. If any deficiency is noted, the equipment will be tagged "DAMAGED" and removed from service. Manufacturer-installed insulated electrical cords will not be repaired or spliced.
 - Extension cords are to be kept clean, free of kinks, and protected from oil, hot or sharp surfaces, and chemicals. Extension cords are not to be placed across aisles, through doors, through holes in a wall, or in areas where the cord may be damaged or create a tripping hazard. Extension cords will be appropriate for the specific task and environment.
 - Extension cord sets for use in field operations should be of the three-wire grounding type and should be designed for hard or extra-hard use. This type of cord will typically utilize insulated wires within an outer insulated sleeve. Examples of such cord include the type marked S, ST, SO, STO, SJ, SJO, or SJTO. Molded wire (flat) cord sets should not be used in field situations. The cord will minimally be rated for the intended current (e.g., heavy duty extension cords are often available in both 15 and 20 amp versions).
 - Use of extension cords is allowed only for temporary installations not to exceed 90 days (e.g., decorations).
 - Extension cords shall be provided with a plug cap that is either molded to the cord or equipped with a cord clamp to prevent strain on the terminal screws.
 - Extension cords shall not be fastened with staples or otherwise hung in a manner that could damage the outer jacket or insulation.

- Extension cords shall be inspected prior to each use to confirm that there is no damage or defects. Defective cords shall not be used.
- Extension cords used with grounding-type equipment (e.g., three-prong plug) shall contain a grounding-type conductor (have three prongs to accept the ground plug).
- Ground fault circuit interrupters shall be used for all nonpermanent wiring needed for construction purposes or when working in wet or moist areas or onboard ships.
- Extension cords used in highly conductive work locations (e.g., wet areas) shall be of the type approved for such locations.
- Grounding-type equipment (e.g., three-prong plugs) shall not be modified to mate to incompatible outlets (e.g., cut off grounding prong to fit two prong outlets).

4.5.9 Temporary Lights/Task Lights

- A temporary light shall not be suspended by the cord unless the cord and light are designed for suspension.
- Temporary lights shall be equipped with bulb protectors unless they are installed at least 7 or more feet overhead.

4.6 Working on or Near Energized Parts

4.6.1 Working on Energized Circuits

Working on or near energized parts covers either potential direct physical contact or contact by means of tools or equipment and working close enough to the energized part to draw an arc. Any AECOM **employee** (Qualified Person) assigned to work on exposed, live electrical systems above 50 volts shall have a person knowledgeable about the task to be performed and emergency response procedures assigned to observe the Qualified Person during the task with the potential exposure. This observer shall have no other assignments during the potential exposure.

- Prior to performing any work near exposed, energized systems, the Qualified Person shall:
 - Perform a Shock Hazard Analysis.
 - Perform an Arc Flash Analysis.
 - Establish emergency contacts.
 - Complete and have approved the Energized Electrical Work Permit.
 - Have all required personal protective equipment (PPE), insulated tools, and test equipment tested and ready to use.
 - Know and understand the procedures to be followed.
 - Ensure that adequate lighting and clearance space is available.
 - Remove all conductive clothing and jewelry.

4.6.2 Working Near Overhead Power Lines

- Personnel working in the vicinity of overhead power lines, either on the ground or elevated, shall comply with *S3NA-406-PR Electrical Lines, Overhead*.
- All workers and equipment including cranes and drill rigs shall maintain a clearance distance of at least 50 feet from overhead power lines unless a detailed assessment demonstrating that a smaller clearance distance provides protection has been completed.

4.7 Grounding

4.7.1 The path to ground from circuits, equipment, and enclosures will be permanent and continuous.

4.7.2 Electrical installations at project sites will be protected by either an equipment grounding conductor program or GFCIs. The two options are:

- All 120-volt, single-phase, 15- and 20-amp receptacles that are not part of permanent wiring will be protected by GFCIs.
- The equipment grounding conductor program will cover extension cords, receptacles, and cord- and plug-connected equipment. The program will include the following elements:

- A written description of the program.
- At least one competent person to implement the program.
- Daily visual inspections of extension cords and cord- and plug-connected equipment for defects. Equipment found damaged or defective shall be removed from use and not used until repaired.
- Continuity tests of the equipment grounding conductors or receptacles, extension cords, and cord- and plug-connected equipment every three months.
- Compliance with the requirements for grounding of systems, circuits, and equipment (see 1926.404 in the US).

4.7.3 If the equipment grounding conductor program option is chosen, the designated competent person at the site shall maintain inspection records.

4.8 **Assured Grounding**

4.8.1 Where AECOM Operations is responsible, projects will have in place a program for the testing and inspection of all temporary electrical supply systems.

4.8.2 Assured grounding is applicable to all cord sets, receptacles that are not a part of the permanent wiring of a building or structure, and all equipment and tools connected by cord or plug.

4.8.3 All cord sets and receptacles will be visually inspected for damage before use.

4.8.4 All items covered by this procedure shall have their grounding conductor tested for continuity and all cord attachments and receptacles shall be tested for polarity to be sure the ground conductor is connected to the proper terminal.

4.8.5 Testing will be done on the following intervals:

- Before first use of any item.
- After repairs and before placing back into service.
- After every incident that might reasonably be suspected of causing damage.
- At intervals not to exceed 3 months.\
- Any tool, cord, or service that does not pass the required tests may not be made available to employees. Such equipment shall be tagged out of service and delivered to the supervisor or competent person for repair or replacement.
- Only a qualified employee (electrician) designated as the competent person may test electrical devices and will:
 - Prior to testing any item, remove any and all of the old color-coding tape or zip strips.
 - Perform the required ground conductor testing and polarity verifications.
 - After passing the necessary tests, the items will be marked by putting a wrap of the color coding tape or zip strip (of the appropriate color) around the cord close to the male and female ends of the electrical cord or by the male end on tools. Receptacle outlets will be marked in the most practical manner.

4.9 **Personal Protective Equipment/Work Practices**

4.9.1 PPE requirements shall be determined based on the results of each of the following: Task Hazard Analysis, Shock Hazard Analysis, and Arc Flash Analysis.

4.9.2 Nonconductive hardhats shall be worn when there is danger of head injury from electric shock or burns due to exposure to energized parts.

4.9.3 Jewelry shall not be worn when working around or with energized parts.

4.9.4 Insulated tools shall be used to work with energized parts. Tools that have insulation that might be damaged (e.g., rubber handles) shall be inspected prior to each use to confirm the insulation is not damaged.

4.9.5 Eye protection with side shields shall be worn when working with energized parts.

- 4.9.6 Rubber mats, non-conductive shields, or protective barriers shall be used as needed to protect employees from electrical hazards.
- 4.9.7 Appropriate insulating gloves shall be worn to pick up or unplug connections that are in highly conductive areas, such as in water.
- 4.9.8 Do not plug in or unplug electric equipment with wet hands.
- 4.10 **Portable Electrical Equipment**
- 4.10.1 Double-insulated, portable, industrial-type electrical tools meeting the requirements of the National Electrical Code (NEC) are authorized for use (ground wire not required). Where this type of tool is used, the equipment will be distinctly marked.
- 4.10.2 Portable electrical tools not provided with special insulating or grounding protection are not for use in damp, wet, or conductive locations (e.g., by persons standing on the ground or on metal floors).
- 4.10.3 All portable electrical appliances and equipment with non-current-carrying metal parts to which personnel may be exposed shall be grounded by a continuous conductor of adequate capacity from the device to a grounded receptacle. The Site Safety Officer shall resolve any question of whether or not a particular appliance should be grounded.
- 4.10.4 Manufacturer-installed guards shall not be tampered with, modified, or removed. These guards will be in place and utilized during operation of equipment.
- 4.10.5 The dimension of the working space in the direction of access to energized parts in switchboards, control panels, fused switches, circuit breakers, panel boards, motor controllers, and similar equipment that requires examination, adjustment, servicing, or maintenance while energized shall not be less than 36 inches deep and 30 inches wide or the width of the equipment, whichever is greater.
- 4.10.6 Portable electrical equipment shall be handled in a manner that will not cause physical damage to the equipment.
- 4.10.7 Portable electrical equipment shall not be carried by the cord.
- 4.10.8 Cords shall not be used to raise or lower equipment.
- 4.10.9 Extension cords shall not be fastened with staples, nails, wire, or otherwise hung in such a fashion that could damage the outer jacket or insulation.
- 4.10.10 Electrical cords shall not be removed from a receptacle by pulling on the cord line.
- 4.10.11 Employees' hands shall not be wet when plugging and unplugging cord and plug connected equipment and extension cords.
- 4.10.12 Disconnect portable electric equipment when not in use, before servicing, and when changing accessories such as blades, bits, and cutters.
- 4.10.13 Portable electric equipment and extension cords used in potentially wet locations shall be approved for use in those locations by a nationally recognized testing laboratory, inspection agency, or other organization concerned with product evaluation (e.g., F.M., UL, etc.).
- 4.10.14 Portable electric equipment and extension cords used in areas exposed to gases, fumes, vapors, liquids, or other agents having a deteriorating effect shall be approved for use in those locations.
- 4.10.15 Portable electric equipment and extension cords used in areas in which hazardous concentrations of flammable gases or vapors exist shall be approved for use in those locations.
- 4.10.16 If an adapter is used to accommodate a three-wire cord to a two-hole receptacle, the adapter wire will be attached to a known ground. The third prong shall never be removed from the plug.
- 4.10.17 After a circuit is de-energized by a circuit protective device, the circuit may not be manually reenergized until it has been determined that the equipment and circuit can be safely energized.
- 4.10.18 The outlet box for portable extension cords for outdoor use shall be weatherproof and shall be maintained in good condition.

5.0 Records

- 5.1 The Shock Hazard Analysis and the Arc Flash Analysis forms shall be retained in the project file.
- 5.2 The completed *S3NA-302-FM Energized Electrical Work Permit* shall be retained in the project file.

2.0 Standards

Canadian Standards Association	C22.1-98, Canadian Electrical Code - Part I

S3NA-302-WI1 Electrical Safe Work Practices

1.0 Purpose

The purpose of this guideline is to confirm that all live electrical work conducted under the control of AECOM personnel is carried out in accordance with recognized best practices in order to provide adequate protection to workers from the hazards of potential arc flash and/or electrical shock.

2.0 Associated AECOM Policies

In addition to this guideline, AECOM will also follow all Federal and State/Provincial Regulations, in particular NFPA-70E and 29CFR part 1910 as well as relevant AECOM SH&E procedures, including *S3NA-302-PR Electrical, General* and *S3NA-410-PR Hazardous Energy Control*.

3.0 Responsibilities

3.1 AECOM's Project Manager

- 3.1.1 Be familiar with all precautions and Federal and State/Provincial regulations and Best Practices, including NFPA-70E.
- 3.1.2 Provide training on this Best Management Practice to authorized employees covering:
 - Nature and control of known shock and arc flash hazards.
 - Means of eliminating and controlling shock and arc flash hazards.
 - Special electrical personal protective equipment (PPE) requirements (task-specific).
 - Procedure for reporting any deviations to this Best Practice.
- 3.1.3 Control access to energized electrical equipment with potential of shock or arc flash to authorized personnel only.
- 3.1.4 Confirm availability of proper tools for the operation and maintenance of electrical equipment.
- 3.1.5 Proper identification and guarding of potentially hazardous electrical equipment.
- 3.1.6 Providing available electrical one-line diagrams.
- 3.1.7 Confirm proper housekeeping around energized electrical equipment at all times.
- 3.1.8 Provide proper working conditions, including adequate lighting, to facilitate work in a safe environment.
- 3.1.9 Proper supervision of employees.
- 3.1.10 Maintaining a list of authorized electrical supervisor, authorized electrical worker, and attendant.
- 3.1.11 Implementation and ongoing evaluation of this Best Management Practice.
- 3.1.12 Terminate the work and cancel the permit when live work has been completed or any new electrical hazard arises.
- 3.1.13 Verify that communication modes are available and have been tested.
- 3.1.14 Remove unauthorized individuals who enter or who attempt to enter the approach boundaries during live work.
- 3.1.15 Confirm that live work remains consistent with terms of the live work permit and that acceptable working conditions are maintained.

- 3.1.16 Withdraw the live work permit and stop all work if unsafe conditions are reported during any live work (e.g. sparking, smoldering etc.). Do not permit work on that equipment until the cause of any unsafe condition is thoroughly investigated and the live work procedure has been reviewed to prevent reoccurrence.

3.2 **Authorized Electrical Attendant**

- 3.2.1 Practice all precautions and federal and state/provincial regulations and Best Practices including NFPA-70E.
- 3.2.2 Understand the hazards that may be faced during live work, including the potential for arc flash, shock hazard, and other related hazards.
- 3.2.3 Be aware of the potential of arc flash or shock possible to the authorized worker.
- 3.2.4 Maintain an accurate count of authorized workers working near the live equipment or inside approach boundaries.
- 3.2.5 Remain near the approach boundary until relieved by another authorized electrical attendant.
- 3.2.6 Communicate with authorized workers as necessary to confirm maintenance of safe conditions at all times.
- 3.2.7 Monitor activities inside and outside the approach zone to determine if it is safe for the worker to continue to remain in the approach zone. Order the authorized worker to stop live work under any of the following conditions:
- The attendant detects a problem;
 - The attendant detects the signs of short-circuiting, such as electrical sparking, smoldering, or any other abnormality;
 - The attendant detects a situation outside the approach zone that could endanger the worker; and
 - If the attendant cannot effectively and safely perform all assigned duties.
- 3.2.8 Perform no other duties that might interfere with the attendant's primary duty to monitor and protect the authorized worker.

3.3 **Authorized Electrical Worker**

- 3.3.1 Practice all precautions and federal and state/provincial regulations and Best Practices including NFPA-70E.
- 3.3.2 Be continuously alert, focused, and aware of the hazards of performing the task.
- 3.3.3 Understand AECOM Safety, Health and Environmental policies and standards as well as site-specific electrical safe work practices.
- 3.3.4 Examine and understand all the documents provided by AECOM and manufacturers, including all specific hazards, advisories, cautions, etc.
- 3.3.5 Perform all work in accordance with applicable federal and state/provincial regulations, AECOM policies, safe work practices, and this Best Management Practice.
- 3.3.6 Be knowledgeable of the use and selection of the proper tools to safely perform the electrical task safely.
- 3.3.7 Complete a Safe Work Plan prior to the start of a task and during work, if conditions change.
- 3.3.8 Maintain good housekeeping around work areas. Remove all debris, materials, etc., at the completion of tasks.
- 3.3.9 Report any hazardous (uncontrolled) conditions to AECOM's authorized supervisor.
- 3.3.10 Understand the hazards that may be faced during live work, including arc flash, shock, or other electrical hazards.

- 3.3.11 Properly use required PPE and electrical tools as specified in this best practice.
- 3.3.12 Communicate with the attendant as necessary.
- 3.3.13 Alert the attendant whenever any abnormality occurs (e.g., sparking, minor shock, burning smell, etc.) or symptoms of unsafe conditions are observed.
- 3.3.14 Stop all work and exit from the approach zone whenever:
 - An order to evacuate is given by the authorized attendant or the authorized supervisor; or
 - When the worker observes any warning sign or symptom of short circuiting or a dangerous situation; or
 - When the supervisor gives an order to stop work.

4.0 Multi-employer Live Electrical Work Coordination

- 4.1 **AECOM's Requirements:** When using another employer to perform work involving live electrical work, AECOM will:
 - 4.1.1 Inform the contractor that the workplace contains shock and/or arc flash potential and that live work is allowed only through compliance with a live work permit program meeting the requirements of NFPA-70E.
 - 4.1.2 Appraise the contractor of the elements of the work, including the hazards identified and all past experiences with the live work that make the live work hazardous.
 - 4.1.3 Appraise the contractor of any precautions or procedures that have been implemented for the protection of employees in the approach zone where contractor personnel will be working.
 - 4.1.4 Coordinate live work operations with the contractor when both AECOM employees and contractor employees will be working in or near approach zone, so that employees of AECOM and the contractor do not endanger each other.
 - 4.1.5 Debrief the contractor at the conclusion of the live work operations.
- 4.2 **Contractor Requirements:** In addition to complying with the live work permit requirements, each contractor who is retained to perform live electrical work will:
 - 4.2.1 Obtain any available information regarding live work from the project manager.
 - 4.2.2 Coordinate live work operations with the project manager when both AECOM personnel and contractor personnel will be jointly working in or near the approach zone.
 - 4.2.3 Practice all precautions and federal and state/provincial regulations and Best Practices including NFPA-70E.
 - 4.2.4 Inform AECOM's project manager of the live work permit that the contractor will be using and of any hazards confronted or created during live work, either through debriefing or during live work.

5.0 Review and Update

This Best Management Practice will be reviewed and updated annually.

6.0 Definitions

- 6.1 **Arc Rating:** The maximum incident energy resistance demonstrated by a material prior to breakdown or at the onset of a second-degree skin burn (expressed in cal/cm²).
- 6.2 **Flash Hazard:** A dangerous situation associated with the release of energy caused by an electric arc.
- 6.3 **Energized Electrical Equipment:** Electrically connected to or having a source of voltage.
- 6.4 **Shock Hazard:** A dangerous situation associated with the possible release of energy caused by contact or approach to live parts.

7.0 Required Minimum Qualifications

- 7.1 All electrical work including instrumentation, installations, maintenance, troubleshooting, calibration, and operation of breakers will only be conducted by qualified, trained, and skilled personnel (this includes AECOM personnel and contractors/subcontractors). These personnel will meet all qualification requirements mandated by the federal/state regulations as well as applicable electrical associations and trade bodies.
- 7.2 The Project Manager, in consultation with SH&E Department, will determine the minimum qualifications requirements for any work with the potential for arc flash.

8.0 Working on or Near Electrical Conductors of Circuit Parts

- 8.1 Safe work practices shall be used to safeguard employees from injury when working on or near exposed electric conductors or circuit parts that can be energized.
 - 8.1.1 Live Parts – Safe Work Conditions: Live parts to which an employee might be exposed shall be put into an electrically safe work condition before an employee works on or near them.
 - 8.1.2 Live Parts – Unsafe Work Conditions: Only qualified persons shall be permitted to work on electrical conductors or circuit parts that have not been put into electrically safe conditions.
- 8.2 Working on or near exposed electrical conductors OR circuit parts that are, or might become, energized – Prior to working on or near exposed electrical conductors and circuit parts operating at 50 volts or more, lockout/tagout devices shall be applied in accordance with AECOM and site-specific policies.
- 8.3 Electrical Hazard Analysis – If the live parts operating at 50 volts or more are not placed in electrically safe condition, other safety-related work practices shall be used to protect employees who might be exposed to electrical hazards. Safe work practices mentioned below shall be established before any person approaches exposed live parts within limited approach boundary:
 - 8.3.1 Shock Hazard Analysis – A shock hazard analysis shall determine the voltage to which personnel will be exposed, boundary requirements, and the PPE necessary in order to minimize the possibility of electrical shock.
 - 8.3.2 Flash Hazard Analysis – A flash hazard analysis shall be done in order to protect personnel from the possibility of being injured by an arc flash. The analysis shall determine the flash protection boundary and the PPE that people within the flash protection boundary shall use.

9.0 Shock Hazard Analysis and Approach Boundaries

- 9.1 The National Fire Protection Association (NFPA) has determined that a comprehensive Shock Hazard Analysis Survey is the best method to:
- 9.1.1 Systematically analyze shock hazards,
 - 9.1.2 Identify approach boundaries, and
 - 9.1.3 Identify appropriate PPE.
- 9.2 Before permitting live work on electrical equipment, each project site having electrical equipment operating at more than 50 volts is required to conduct Shock Hazard Analysis Survey. Upon completion of the survey, the applicable electrical areas/spaces will be labeled in accordance with survey results.
- 9.3 Shock hazard analysis for individual equipment is not required if a facility-wide shock hazard analysis has been conducted and if conditions (including labels and signage) are maintained at all times.
- NOTE: Only authorized personnel are allowed to work within the approach boundaries.*
- 9.4 No qualified person shall approach or take any conductive object closer to exposed live parts operating at 50 volts or more than the restricted approach boundary set forth in Appendix A-1 [Table 130.2 (C) of NFPA 70-E].
- 9.5 In the absence of facility-wide survey, a shock hazard analysis (including the identification of approach boundaries) shall be conducted in accordance with NFPA 70E Section 130.2 and Table 130.2 (C) (see Appendix A-1 of this Practice) for all electrical equipment operating at over 50 volts.
- 9.6 Results of both facility-wide as well as individual shock hazard survey shall be made available to all authorized employees. Additionally, any recommendations given by the survey generated from the survey shall be reviewed by the project manager and shall be addressed in a timely manner.

10.0 Arc Flash Hazard Analysis and Approach Boundaries

- 10.1 Arc flash safety requirements apply to all electrical equipment operating at 50 volts or more.
- 10.2 Similar to the shock hazard analysis, the NFPA has determined that a comprehensive Arc Flash Hazard Analysis Survey is the best method to:
- 10.2.1 Systematically analyze the potential for arc flash,
 - 10.2.2 Identify the limits of the approach, and
 - 10.2.3 Identify appropriate PPE.
- 10.3 Once a comprehensive facility arc flash survey has been conducted and electrical work areas/spaces are labeled in accordance with survey results, an individual arc flash hazard analysis is not required, provided that qualified personnel confirm that the conditions, as indicated on the labels and signs, are maintained.
- NOTE: Only authorized personnel are allowed to work within the limits of approach.*
- 10.4 Please refer to Appendix A-1 for details.
- 10.5 Prior to performing any work on energized electrical systems, an arc flash hazard analysis [including the identification of approach boundaries] will be conducted in accordance Appendix F of this practice (taken from NFPA 70E Section 130.3)].

11.0 Required PPE Categorized by Exposure

The following specialized PPE requirements will be used while working on energized electrical systems:

- 11.1 PPE as prescribed by the shock hazard analysis and arc flash analysis; or
- 11.2 PPE requirements identified in Appendix A-2 of this practice (taken from NFPA 70E Sections 130.2 and 130.7).

12.0 Required Tools and Equipment

- 12.1 Only tools and testing or protective equipment approved by ANSI/ASTM for the relevant voltage rating [see Table 130.7(C)(8) or Canadian Standards Association for appropriate voltage rating] will be used when working on energized electrical systems. All tools and testing or protective equipment will be visually inspected prior to use to confirm that the protection systems associated with the tool or equipment are not damaged or impaired and that diagnostic meters and tools are configured properly. Any tool or testing or protective equipment suspected of being compromised will be immediately taken out of service and will be tagged for disposal.

13.0 Work on Energized Electrical Systems

- 13.1 It is the policy of AECOM that all electrical maintenance or troubleshooting will be done on de-energized circuits, to the extent practical. Work on energized circuits can only be done under special circumstances using a "Live Work Permit" issued by authorized electrical supervisor. This permit takes into consideration the voltage levels, known electrical hazards, communication requirements, and need for watch persons, etc. The following procedure will be observed for a live work permit:
 - 13.1.1 The person requesting the work (authorized worker) will complete the permit and will retain the original with him or her during the work. Copy of the permit will be displayed at a prominent location in the control room as a notice that live work has been authorized in certain part of the plant/project.
 - 13.1.2 Permit will be reviewed for correctness, proper safety precautions, and adequacy of controls by the authorized electrical supervisor. After satisfying all safety requirements, an authorized electrical supervisor will sign the permit and will give the original copy to the authorized electrical worker.
 - 13.1.3 Upon work completion, the authorized worker will note any observation on the permit and will return the original to the authorized supervisor.
 - 13.1.4 Authorized supervisor will keep both copies of the permit as a controlled record for a period of 12 months.
- 13.2 The following conditions will be met for live electrical work:
 - 13.2.1 If any equipment or instrumentation is to be disabled while other related components or systems are still functioning, the Live Work Permit should record how process safety of the remaining systems will be maintained.
 - 13.2.2 All electrical and instrumentation work conducted will be recorded in the applicable MCC log. The documentation will include a reference to the permit number where appropriate.
 - 13.2.3 The worker will inform the operations supervisor that he or she intends to de-energize a circuit. He or she will also inform the operations supervisor when the work is complete and that the system can be returned to service.
- 13.3 See *S3NA-302-FM Energized Electrical Work Permit* for a suggested template for a "Live Work Permit."

14.0 Lockout/Tagout Policy and Procedures

- 14.1 All equipment will be locked out prior to any work commencing in accordance with AECOM's policy *S3NA-410-PR Hazardous Energy Control* and applicable site specific lockout/tagout program.

15.0 Troubleshooting Procedure

- 15.1 The troubleshooting of electrical equipment often requires working with live circuits. Where possible, work will be done on de-energized circuits following the relevant AECOM and site-specific lockout/tagout policy. However, troubleshooting may require limited work on live circuits; if such work is required it will be done using the "Live Work Permit" and site-specific Troubleshooting Guidelines.

16.0 Housekeeping

- 16.1 All areas containing electrical equipment will:
- 16.1.1 Be maintained and kept clean.
 - 16.1.2 Be well illuminated.
 - 16.1.3 Not be used for storage of supplies.
 - 16.1.4 Not be used for the storage of any flammable materials.
 - 16.1.5 Be assessed for safety hazards.
 - 16.1.6 Be suitably ventilated to control dust, temperature, and humidity.

17.0 Communication

- 17.1 Personnel working in or around equipment with electrical hazards will employ a suitable means of communication to confirm their safety.
- 17.2 The means of communication may include:
- 17.2.1 Authorized attendant (required for ALL live work conducted on 600 volts and above) (CFR 29 1910.335(b)(3) in the United States).
 - 17.2.2 Permits.
 - 17.2.3 Two-way radios.

18.0 Signage and Labels

- 18.1 MCCs, ECRs, battery rooms, and electrical panels are required to have the following labeling to identify arc flash and shock hazards. The information on the label will include:
- 18.1.1 Flash Hazard Boundary (Arc Flash Current).
 - 18.1.2 Flash Hazard at 18 inches in cal/cm² or joules.
 - 18.1.3 Hazard Risk Categories (PPE requirements).
 - 18.1.4 Shock Hazards.
 - 18.1.5 Limited Approach Boundaries.
 - 18.1.6 Restricted Approach.
 - 18.1.7 Prohibited Approach.
 - 18.1.8 Log book to record all electrically related activities.
- 18.2 All doorways to buildings and enclosures containing energized electrical equipment will be signed to indicate that:
- 18.2.1 Access is restricted to authorized personnel only.
 - 18.2.2 Electrical hazards exist beyond this (boundary, door, etc.).

19.0 Management of Change

- 19.1 Any changes to electrical and/or project instrumentation will be conducted following the prescribed management of change policy.

APPENDIX A-1

Table 130.2(C) Approach Boundaries to Live Parts for Shock Protection

(All dimensions are distance from live part to employee.)

Nominal Voltage Range (Phase to Phase)	Limited Approach Boundary	Exposed Fixed Circuit Parts	Restricted Approach Boundary; includes inadvertent movement adder	Prohibited Approach Boundary
	Exposed Moveable Conductor			
Up to 50 Volts	Not Specified	Not Specified	Not Specified	Not Specified
50-300	10 ft	3.5 ft	Avoid Contact	Avoid Contact
300-750	10 ft	3.5 ft	1 ft	1 inch
More than 750 volts	Consult NACO's Master Electrician or other authorized electrician.			

APPENDIX A-2

Table 130.7(C)(10) Protective Clothing and Personal Protective Equipment (PPE) Matrix

Table 130.7(C)(11) Protective Clothing Characteristics

Hazard/Risk Category	Clothing Description (Typical number of clothing layers is given in parentheses)	Required Minimum Arc Rating of PPE [(J/cm ² (cal/cm ²)]
0	Non-melting, flammable materials (i.e., untreated cotton, wool, rayon, or silk, or blends of these materials) with a fabric weight at least 4.5 oz/yd ² (1)	N/A
1	FR shirt and FR pants or FR coverall (1)	16.74 (4)
2	Cotton underwear – conventional short sleeve and brief/shorts, plus FR shirt and FR pants (1 or 2)	33.47 (8)
3	Cotton underwear plus FR shirt and FR pants plus FR coverall, or cotton underwear plus two FR coveralls (2 or 3)	104.6 (25)
4	Cotton underwear plus FR shirt and FR pants plus multilayer flash suit (3 or more)	167.36 (40)
<p>NOTE:</p> <p>Arc rating: Arc rating is defined in Article 100 and can be either ATPV or E_{BT}.</p> <p>ATPV: ATPV is defined in ASTM F 1959-99 as the incident energy on a fabric or material that results in sufficient heat transfer through the fabric or material to cause the onset of a second-degree burn based on the Stoll curve.</p> <p>E_{BT}: E_{BT} is defined in ASTM F 1959-99 as the average of the five highest incident energy exposure values below the Stoll curve where the specimens do not exhibit breakopen. E_{BT} is reported when ATPV cannot be measured due to FR fabric breakopen.</p>		

APPENDIX B

Protective Clothing and Equipment	Protective Systems for Hazard/Risk Category					
Hazard/Risk Category Number	-1 (Note 3)	0	1	2	3	4
Non-melting (according to ASTM F 1506-00) or Untreated Natural Fiber						
a. T-shirt (short-sleeve)	X			X	X	X
b. Shirt (long-sleeve)		X

1. Safety glasses	X	X	X	AL	AL	AL
2. Safety goggles				AL	AL	AL
e. Face and head area protection		—	—	—	—	—
1. Arc-rated face shield, or flash suit hood				X (Note 8)		
2. Flash suit hood					X	X
3. Hearing protection (ear canal inserts)				X (Note 8)	X	X
f. Hand protection			—	—	—	—
Leather gloves (Note 2)			AN	X	X	X
g. Foot protection						
Leather work shoes			AN	X	X	X
AN = As needed AL = Select one in group AR = As required X = Minimum required						
NOTES: 1. See Table 2. Arc rating for a garment is expressed in cal/cm ² . 2. If voltage-rated gloves are required, the leather protectors worn external to the rubber gloves satisfy this requirement. 3. Hazard/Risk Category Number "-1" is only defined if determined by Notes 3 or 6 of Table 130.7(C)(9)(a). 4. Regular weight (minimum 12 oz/yd ² fabric weight), untreated, denim cotton blue jeans are acceptable in lieu of FR pants. The FR pants used for Hazard/Risk Category 1 shall have a minimum arc rating of 4. 5. Alternate is to use FR coveralls (minimum arc rating of 4) instead of FR shirt and FR pants. 6. If the FR pants have a minimum arc rating of 8, long pants of non-melting or untreated natural fiber are not required beneath the FR pants. 7. Alternate is to use FR coveralls (minimum arc rating of 4) over non-melting or untreated natural fiber pants and T-shirt. 8. A face shield with a minimum arc rating of 8, with wrap-around guarding to protect not only the face, but also the forehead, ears, and neck (or, alternately, a flash suit hood), is required. 9. Alternate is to use two sets of FR coveralls (the inner with a minimum arc rating of 4 and outer coverall with a minimum arc rating of 5) over non-melting or untreated natural fiber clothing, instead of FR coveralls over FR shirt and FR pants over non-melting or untreated natural fiber clothing.						

Table 2: Protective Clothing Characteristics

Hazard/Risk Category	Clothing Description (Typical number of clothing layers is given in parentheses)	Required Minimum Arc Rating of PPE [(J/cm2 (cal/cm2)]
0	Non-melting, flammable materials (i.e., untreated cotton, wool, rayon, or silk, or blends of these materials) with a fabric weight at least 4.5 oz/yd ² (1)	N/A
1	FR shirt and FR pants or FR coverall (1)	16.74 (4)
2	Cotton underwear – conventional short sleeve and brief/shorts, plus FR shirt and FR pants (1 or 2)	33.47 (8)
3	Cotton underwear plus FR shirt and FR pants plus FR coverall, or cotton underwear plus two FR coveralls (2 or 3)	104.6 (25)
4	Cotton underwear plus FR shirt and FR pants plus multilayer flash suit (3 or more)	167.36 (40)
<p>NOTE:</p> <p>Arc rating is defined in Article 100 and can be either ATPV or E_{BT}. ATPV is defined in ASTM F 1959-99 as the incident energy on a fabric or material that results in sufficient heat transfer through the fabric or material to cause the onset of a second-degree burn based on the Stoll curve. E_{BT} is defined in ASTM F 1959-99 as the average of the five highest incident energy exposure values below the Stoll curve where the specimens do not exhibit breakopen. E_{BT} is reported when ATPV cannot be measured due to FR fabric breakopen.</p>		

APPENDIX C

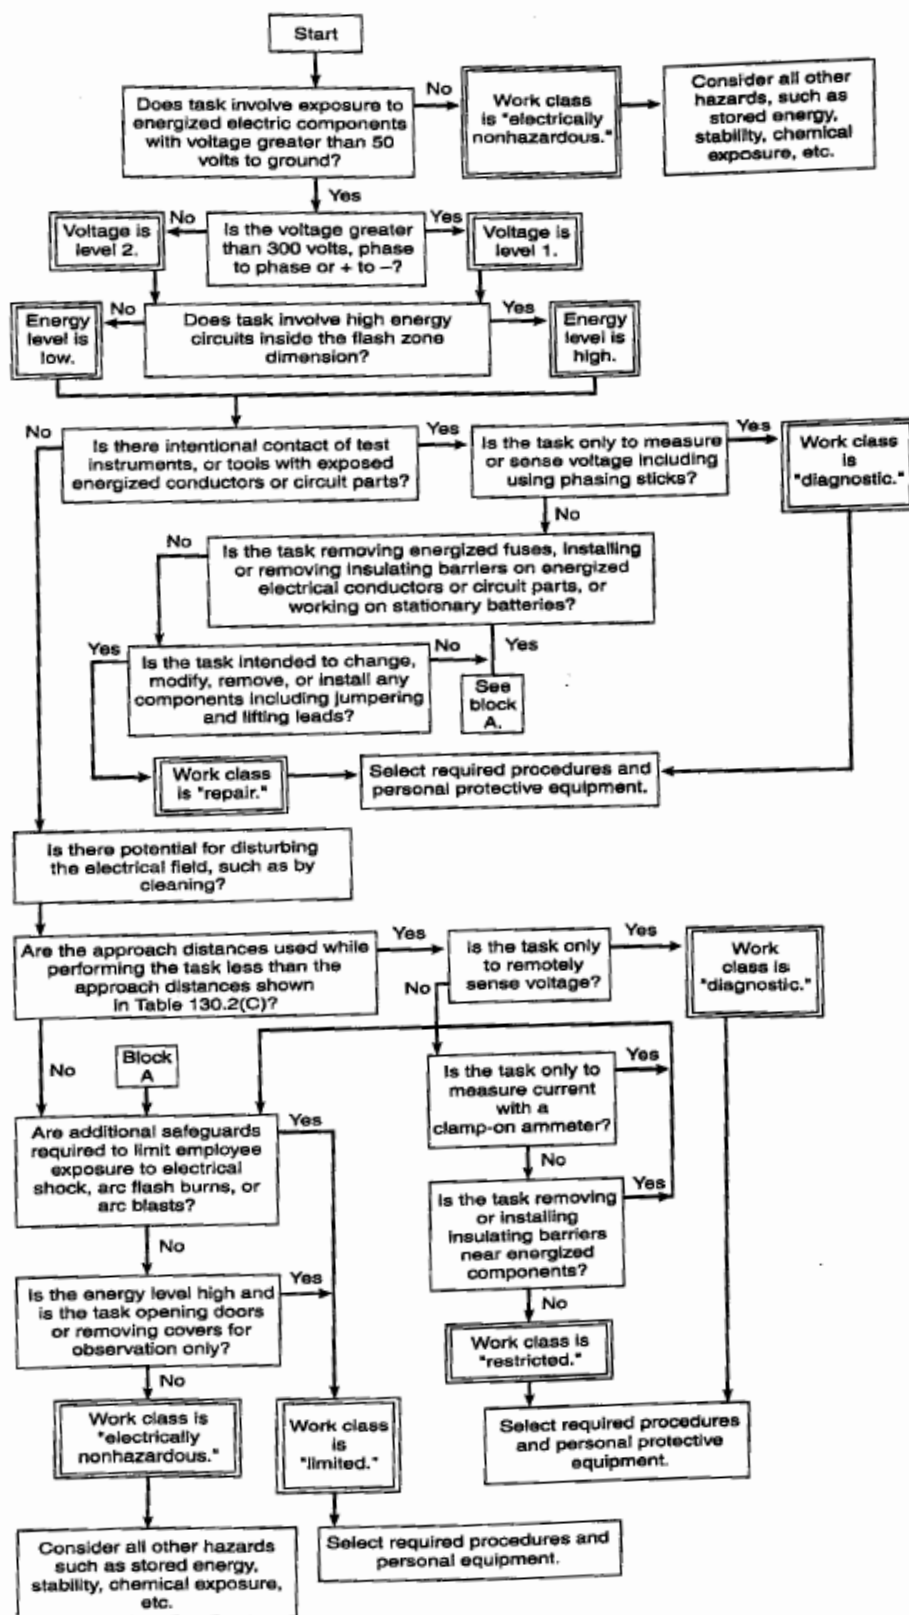

Figure F.1 Hazard/Risk Analysis Evaluation Procedure Flow Chart.

APPENDIX E**Flash Protection Boundary**

For system that are above 600 volts or less, the Flash Protection Boundary shall be 4.0 ft., based on the product of clearing time of 6 cycles (0.1 second) and the available bolted fault current of 50 kA, or any combination not exceeding 300 kA cycles (5,000 ampere seconds).

For clearing times and bolted fault currents other than 300kA cycles, or under engineering supervision, the Flash Protection Boundary shall alternatively permitted to be calculated in accordance with the following general formula:

$$D_c = [2.65 \times MVA_{bf} \times t]^{1/2}$$

or

$$D_c = [53 \times MVA \times t]^{1/2}$$

where:

D_c = distance in feet from an arc source for a second-degree burn

MVA_{bf} = bolted fault capacity available at point involved (in mega volt-amps)

MVA = capacity rating of transformer (mega volt-amp). For transformer with an MVA rating below 0.75 MVA, multiply the transformer MVA rating by 1.25

t = time of arc exposure (in seconds)

At voltage levels above 600 volts, the Flash Protection Boundary is the distance at which the incident energy equals 5 J/cm² (1.2 cal/cm²). For situations in which fault-clearing time is 0.1 second (or faster), the Flash Protection Boundary is the distance at which the incident energy equals 6.24 J/cm² (1.5 cal/cm²).

S3NA-302-WI2 Ground Fault Protection Safe Work Practices

1.0 Background

- 1.1 OSHA standard 1926.404(b)(1) requires “ground fault protection” on construction sites. The standard allows two different approaches to providing the required protection for employees from electrical ground faults. Either “ground fault circuit interrupters” (GFCI) are to be used with temporary receptacles, or an “assured equipment grounding conductor program” is to be established in which plug-connected electrical equipment, extension cords, and temporary receptacles are tested on a periodic basis.

2.0 Ground Fault Circuit Interrupters

- 2.1 A GFCI is an electrical device that is designed to prevent electrocution from electrical leakage. It is designed to measure the difference in amperage between the “hot” wire and the “neutral” wire in a circuit. Under ideal conditions, the amperage should be the same in both wires. If there is electrical leakage (a ground-fault), the amperages will be different. If the difference is more than a predetermined amount, the GFCI “trips” and stops the flow of electricity.
- 2.2 GFCIs may trip from many causes:
- 2.2.1 Electrical leakage in the tool from internal defects.
- Electrical leakage in the extension cord from damaged insulation or from normal leakage in long runs of cords.
- 2.2.2 Moisture in the air or cords lying in water or on moist dirt.
- 2.2.3 Too many tools on one GFCI circuit.
- Electromagnetic interference from two-way radios or from power transmission lines.
- 2.2.4 Faulty wiring of the GFCI into the circuit.
- 2.2.5 Defective GFCI.
- 2.2.6 Any such tripping will require the problem to be corrected before the protected circuit can be re-set.
- 2.3 All 120-volt, single phase, 15 and 20 ampere temporary receptacles shall be protected with “approved” GFCIs. “Approved” means listed by Underwriters Laboratories.
- 2.4 There are several types of GFCIs.
- 2.4.1 A combination circuit breaker and GFCI that is installed in place of the ordinary circuit breaker.
- 2.4.2 A receptacle containing a built-in GFCI.
- 2.4.3 A portable GFCI that plugs into a receptacle and allows the extension cord or tool to be plugged into the GFCI.
- 2.4.4 A portable unit containing several GFCI protected receptacles.
- 2.5 GFCIs contain a test button and a reset button. Each GFCI needs to be tested prior to use and on a periodic basis depending upon the manufacturer's recommendations (at a minimum monthly).

3.0 Assured Equipment Grounding Conductor Program

- 3.1 If an assured equipment grounding conductor program is to be used instead of GFCIs to provide ground fault protection, the program shall be governed by the following requirements.

- 3.1.1 Temporary receptacles shall be electrically grounded in accordance with the temporary wiring requirements of the National Electrical Code.
- 3.1.2 Extension cords shall be three-wire cords containing an equipment grounding conductor (ground wire).
- 3.1.3 Electrical equipment that is plugged into a receptacle or extension cord (portable electrical tools, bench grinders, electric heaters, etc.) shall have a ground wire properly attached to the non-current-carrying metal parts of the equipment. (Double-insulated tools have no ground wire and are therefore exempt from these testing and recording requirements but still need to be inspected for defects.)
- 3.1.4 The Worksite Manager and/or Supervisor are required to designate one or more competent persons to administer this testing and recording program.
- 3.1.5 Periodic testing of all plug-connected equipment, all extension cords, and all temporary receptacles is to be conducted at the following times:
- Before a new item (equipment, cord, or receptacle) is put into use.
 - After any repairs to the item.
 - After any incident in which the item may have been damaged.
 - Within 3 months of the last test. (An exception is allowed in the Standard in which extension cords, and temporary receptacles, which are fixed in place and are not exposed to damage, may be tested every 6 months.)
- 3.1.6 The purpose of the test is to determine the following:
- Temporary receptacles—to be sure that the receptacle is grounded.
 - Extension Cords—to be sure that the ground wire is connected to the proper terminal at each end and that the ground wire is continuous throughout the length of the cord.
 - Plug Connected Equipment—to be sure that the ground wire is connected to the proper terminal and to the non-current carrying metal parts of the equipment and that the ground wire is continuous from the equipment to the plug.
- 3.1.7 The tests may be conducted using the following instruments:
- A receptacle tester may be used to test receptacles and to test extension cords when plugged into a receptacle.
 - A continuity tester, or a volt-ohm meter, may be used to test equipment and to test extension cords when not plugged into a receptacle.
- 3.1.8 Records must be kept to show which items have passed the test and when the test was conducted. These records may be either written inspection logs, a color coding system using colored tape attached to the item, or some other effective means.
- 3.1.9 Color coding shall be used in the following manner:
- After a plug-connected piece of equipment or an extension cord has passed the test, colored tape is to be placed around the cord near the plug. After a temporary receptacle has passed the test, colored tape is to be placed on the cover plate.
 - Any set of colors may be used, with the exception of white, black, or silver.
 - If there has been no overall site requirements established by the general contractor, use the following colors for the test periods.

January, February, March	Red
April, May, June	Blue
July, August, September	Orange
October, November, December	Green

- 3.1.10 The tests administered every three months are to begin on the first working day of each quarter. Testing and color coding are to be continued until all items covered by this program have been tested. The test administered every six months, for those receptacles and extension cords needing only semi-annual testing, are to be color coded using the quarterly color current at the time of the semi-annual test.
- 3.1.11 A visual inspection of plug-connected equipment, extension cords, and temporary receptacles is to be made by the user before each use. The purpose of the visual inspection is to look for damage or defects that could affect the safe use of the item. (Exception: extension cords and temporary receptacles that are fixed in place and not exposed to damage are not required to be give a daily visual inspection, but it is a good idea to do the daily visual inspection anyway.)
- 3.1.12 Equipment, cords, or receptacles showing damage or defects that could affect its safe operation are not to be used. This applies not only to the visual inspection before each use but also applies to any evidence of damage observed any time during use. Damaged items are to be taken out of service and are not to be used until properly repaired and retested.
- 3.1.13 Equipment covered by this program is not to be used until the equipment has been tested and color coded according to the requirements of this program.
- 3.1.14 A copy of this program is to be kept at the worksite.

S3NA-302-WI3 Generator Safety Card

1.0 Objective/Overview

- 1.1 Portable generators should be used with extreme caution in order to prevent personal injury. When using a portable generator it is important to follow the manufacturer's instructions to avoid injuring someone or damaging your generator or appliances. Allow only trained, authorized personnel to operate the generator. Along with training, other safety measures include proper maintenance of equipment and personal protective equipment (PPE). Remember muscle strains are the most common injury associated with portable generators.

2.0 Safe Operating Guidelines:

- 2.1 Follow manufacturer's recommended operating instructions; every generator is not the same. Maintain adequate ventilation. Generators emit carbon monoxide (CO). Never operate a generator in an enclosed building without proper ventilation. Turn the generator off to refuel. Gasoline and its vapors may ignite if they come into contact with hot components or an electrical spark, so store fuel in a properly designed container in a secure location. To avoid a shock, make sure that your hands are dry and that you are standing in a dry place whenever you operate the generator. Turn off equipment and lights supplied by the generator until it is running. Use the right extension cord. Use only UL-listed, three-prong extension cords. Be sure the extension cord is the proper size (wire-gauge) to handle the electric load that will be plugged into it. Make sure the generator is properly grounded prior to each use. Using a portable generator to tie into the wiring of an existing structure shall be done only by a licensed electrician.

2.1.1 Potential Hazards:

- Lifting, carrying, and pulling starter cords.
- Burns from contact with the hot muffler or engine.
- Shocks/electrocution.
- Noise exposure.
- Inhaling exhaust gases, CO.

2.1.2 Training Requirements:

- Review of Applicable SOPs.
- Back Injury Prevention.
- Demonstrated knowledge on the use of a generator.
- Review of manufacturers operating guidelines.

2.1.3 Personal Protective Equipment (Level D PPE):

- Leather Gloves.
- Hearing Protection.
- Long Sleeve Shirt (i.e., to shield from burns, etc.).

2.1.4 Other Safety Tips:

- Have a Class A:B:C fire extinguisher readily available at all times.

S3NA-303-PR Excavation and Trenching

1.0 Purpose and Scope

- 1.1 To evaluate all excavation operations to provide for proper protective systems for employee protection from associated hazards.
- 1.2 This SOP applies to all AECOM North America-based employees and operations.

2.0 Terms and Definitions

- 2.1 **Benching (Benching system):** A series of horizontal levels or steps, usually with vertical or near-vertical surfaces between levels to protect employee from cave-ins.
- 2.2 **Cave-in (collapse):** The separation of a mass of soil or rock material from the side of an excavation or the loss of soil from under a trench shield or support system and its sudden movement into the excavation, either by falling or sliding, in sufficient quantity so that it could entrap, bury, or otherwise injure and immobilize a person.
- 2.3 **Competent person:** Person, who, by way of training, knowledge, and/or experience, is capable of classifying soils and is also capable of identifying existing and predictable hazards in excavation/trenching work area and who has the authority to take prompt corrective measures to eliminate them. The person must also be familiar with the requirements in the regulation.
- 2.4 **Excavation:** A manmade cut, cavity, trench, or depression in an earth surface formed by earth removal. Examples include trenches, tunnels, shafts, caissons and open cut holes.
- 2.5 **Faces (or sides):** The vertical or inclined earth surfaces formed as a result of excavation work.
- 2.6 **Failure:** A structural member's integrity and supportive capabilities is compromised, causing a breakage, displacement, or permanent deformation.
- 2.7 **Hazardous Atmosphere:** An atmosphere that by reason of being explosive, flammable, poisonous, corrosive, oxidizing, irritating, oxygen-deficient, toxic, or otherwise harmful may cause death, illness, or injury.
- 2.8 **Protective Systems:** Devices or methods in protecting employees in an excavation from cave-ins, a collapse or falling material. Protective systems include support systems, sloping and benching systems, shield systems, and other systems that provide the necessary protection.
- 2.9 **Ramp:** An inclined walking or working surface that is used to gain access to one point from another and is constructed from earth or from structural materials such as steel or wood.
- 2.10 **Registered Professional Engineer:** An engineer who can authorize any state of work by his professional designation. However, a professional engineer registered in the state, province, or territory is deemed to be a "registered professional engineer" within the meaning of this standard when approving designs for "manufactured protective systems" or "tabulated data" to be used in interstate commerce.
- 2.11 **Shield (Shield system):** A structure that is able to withstand the forces imposed on it by a cave-in and thereby protects employees within the structure. Shields can be permanent structures or can be designed to be portable and moved along as work progresses. Additionally, shields can be either pre-manufactured or job-built. Shields used in trenches are usually referred to as "trench boxes" or "trench shields."
- 2.12 **Shoring (Shoring system):** A structure such as a metal hydraulic, mechanical, or timber shoring system that supports the sides of an excavation and that is designed to prevent cave-ins.
- 2.13 **Sloping (Sloping system):** An alternative to shoring is trench sloping. This means that the trench walls are cut back to decrease the possibility of cave-ins. The angle of incline required to prevent a cave-in varies with such factors as soil type, environmental conditions of exposure, and application of surcharge loads.

- 2.14 **Stable rock:** A natural solid mineral material that can be excavated with vertical side wall; unstable rock is considered to be stable when the rock material on the side or sides of the excavation is secured against cave-in or movement by rock bolts or by another protective system that has been designed by a registered professional engineer.
- 2.15 **Support system:** A structure such as underpinning, bracing, or shoring that provides support to an adjacent structure, underground installation, or the sides of an excavation.
- 2.16 **Trench:** An open narrow excavation made below the surface of the ground. In general, the depth is greater than the width, but the width (measured at the bottom) is often not greater than 15 feet (4.6 m). If forms or other structures are installed or constructed in an excavation so as to reduce the dimension measured from the forms or structure to the side of the excavation to 15 feet (4.6 m) or less (measured at the bottom of the excavation), the excavation is also considered a trench.
- 2.17 **Trench Box:** A trench box is a unit of shoring that is an engineered shoring system capable of protecting workers in case of cave-in of trench walls. The space between the trench wall and the trench box must be backfilled.

3.0 Attachments

- 3.1 S3NA-303-FM Daily Excavation Checklist
- 3.2 S3NA-303-WI1 Selection of Protective Systems
- 3.3 S3NA-303-WI2 Sloping Options
- 3.4 S3NA-303-WI3 Shoring or Shielding Options
- 3.5 S3NA-303-WI4 Factors Affecting Shoring Methods

4.0 Procedure

4.1 Restrictions

- 4.1.1 Because of their inherent dangers, entry into trenches and excavations shall not be performed if there are means other than entry to perform the work. Where entry into trenches and excavations is necessary, strict adherence to the procedures specified below is extremely important. Whenever there are questions regarding the safety of trench or excavation entry, contact shall be made with the Competent Person or the **Region SH&E Manager**.
- 4.1.2 No one shall enter any trench or excavation until the walls have been adequately cut back or temporary protective structures have been installed unless the trench or excavation is shallower than the legal minimums and the soil is stable.
- 4.1.3 Excavation work must be completed and inspected in accordance with the written instructions of a qualified professional and in accordance to the provincial, territorial, state, or federal regulations.

4.2 Competent Person

- 4.2.1 A competent person must be present during all work that involves entry by AECOM personnel into trenches or excavations greater than 5 feet/1.5m in depth (as above).
- 4.2.2 The competent person does not have to be an AECOM employee; however, an AECOM competent person must be qualified per *S3NA-202-PR Competent Person Designation*.
- 4.2.3 For the purpose of this SOP, a competent person is defined as an individual, who by education or experience, is capable of evaluating the hazards associated with trench or excavation collapse and is capable of classifying soils. The competent person for the project will be indicated in the Task Hazard Analysis for the project.
- 4.2.4 The competent person:
- Will determine the maximum allowable slope for the walls of the trench or excavation.
 - Will classify the soil in the trench or excavation in accordance with the requirements specified in the legislation (e.g., CFR 1926 subpart P, Appendix A Soil Classification) prior to determining that a maximum allowable slope, other than 34° with the horizontal is selected.
 - Will inspect the excavation or trench on a daily basis when the potential for employee exposure to the hazards of the trench or excavation exists (*S3NA-303-FM Daily Excavation Checklist*).

4.3 Project Managers

- 4.3.1 All projects under their direct control or authority and involve excavations or trenching are conducted in a safe and efficient manner and in accordance with the requirements of this SOP.
- 4.3.2 All projects under their direct control or authority have a written HASP prepared for the activity.

4.4 Underground and Overhead Utilities

- 4.4.1 Prior to beginning any excavation work at a site, the location of all underground and overhead utilities shall be identified and work locations will be carefully planned to avoid any potential for inadvertent contact with them.
- 4.4.2 Locate underground utilities and expose prior to excavating.
- 4.4.3 Identify any overhead power lines and de-energize or protect by other appropriate means.

4.5 Excavation Requirements

- 4.5.1 Soil conditions, wall slope, or shoring must be identified and designed by a professional engineer or qualified professional to meet the federal, state, provincial, territorial regulations.
- 4.5.2 Excavated (spoil) material shall be kept at least 1.0 metre (3.2 feet) from the edge of the excavation, or further if local regulations are more stringent.
- 4.5.3 If the walls of an excavation or trench are not sloped or cutback, barriers must be placed around the perimeter. The barrier must be at least 1.1 metres (3.6 feet) in height.
- 4.5.4 Workers must be protected whenever shoring is being installed or removed.
- 4.5.5 If water is controlled or prevented from accumulating by the use of water removal equipment, the water removal equipment and operations shall be monitored regularly to ensure proper operation.
- 4.5.6 If excavation work interrupts the natural drainage of surface water (such as streams), diversion ditches, dikes, or other suitable means shall be used to prevent surface water from entering the excavation and to provide adequate drainage of the area adjacent to the excavation. Excavations subject to runoff from heavy rains will require regular inspections.
- 4.5.7 All excavations must be secured at the end of the day with a protective covering or appropriate barriers to prevent the public from falling into the open excavation.
- 4.5.8 Backfill trenches as soon as reasonably possible after work is complete.

4.6 Sloping or Shoring Protection Requirements

- 4.6.1 A Professional Engineer or Qualified Soils professional can properly assess the need for and the type of shoring required for specific applications. Shoring may not be needed in all cases, but failure to recognize the need for shoring can be catastrophic.
- 4.6.2 **Exceptions.** Each individual in an excavation shall be protected from cave-ins and trench collapse by an adequate protective system except when
- Excavations are made entirely in stable rock.
 - Excavations are less than 5 feet (and as above) in depth and an examination of the excavation by a competent person reveals no indication of a potential cave-in.
- 4.6.3 The depth of the excavation is to be measured at its greatest vertical dimension. Be aware that crouching or kneeling in a trench that is greater than 3 feet in depth may still pose significant hazard for the employee involved. The three means for supporting trench walls are sloping, shoring, and trench boxes.
- 4.6.4 The protective system may include sloping the excavation walls, shoring the excavation walls, or installing a shielding system. The protective system chosen must have the capacity to resist, without failure, all loads to be applied to the system.
- 4.6.5 Any excavation deeper than 20 feet (6.0 m); a professional engineer must approve and sign on all protective systems.

4.6.6 Trenches must be protected from cave-ins or loss of ground prior to workers entering the trench when the following conditions apply:

- The trench is greater than 3'11" (1.2 m) in depth (however, even if the trench is less than 1.2 meters deep the potential for a cave-in exists, and appropriate controls must be implemented prior to entry to ensure the trench is safe);
- A worker is required to enter the trench;
- A worker is required to be closer to a trench wall than the height of the trench wall; and,
- If an excavation may affect the stability of an adjacent building or structure, precautions must be taken to prevent damage to the structure. The precautions shall be specified in writing by a professional engineer.

4.7 Use of Sloping as a Means of Protection

4.7.1 Sloping the walls of the trench or excavation is the preferred, and typically simplest, means of protecting employees who must enter trenches or excavations which are greater than 5 feet (1.5 m) in depth or where there is danger of collapse.

4.7.2 The trench or excavation walls may be sloped back so that the ratio of the horizontal distance to the vertical rise (H:V ratio) of the sloped wall is at least 1½:1 (i.e., equivalent to an angle with the horizontal of 34° or less) or,

4.7.3 In many cases, determining the maximum allowable slope may allow the use of a steeper slope, which will result in a narrower excavation. However, determination of soil classification is complicated and requires that the competent person be familiar with the manual and visual tests. Since incorrect soil classification may result in the use of a steeper, and potentially unsafe, slope, it is recommended that an angle of 34° (or less) with the horizontal typically be selected.

4.8 Use of Shoring or Shielding as a Means of Protection

4.8.1 Where sloping the walls of the trench or excavation is unfeasible (e.g., when there are dimensional constraints or adjacent structures), the use of shoring or shield systems (e.g., trench boxes) may be necessary.

4.9 Work Around the Trench/Excavation

4.9.1 While workers are in a trench, an aboveground observer must be present to warn of earth movements and to advise equipment operators of the presence and location of those in the trench so as to avoid vibrating equipment near trenches or excavations.

4.9.2 If there is a danger of a worker or equipment falling into an excavation, or whenever the edge is not clearly visible, you must identify the trench or excavation perimeter with visual markers (e.g., barricade tape, wooden railings, stop logs, etc). If the trench or excavation is 4 ft (1.2 m) or greater in depth, the visual barrier must be a minimum of 6 ft (1.8 m) from the edge.

4.9.3 Personnel must notify workers of the excavation through flagging, marking, safeguards, or other appropriate and effective means.

4.9.4 Where employees or equipment are required or permitted to cross over excavations, walkways, or bridges, walkways or bridges over excavations must have a minimum clear width of 20 inches (0.6 meters), be fitted with standard guard rails and extend a minimum of 24 inches (0.6 meters) past the surface edge of the trench. If vehicle crossings over excavations are required, they must be designed by and installed under the direction of a registered professional engineer.

4.9.5 Precautions must be taken to isolate loose rocks or other materials that may slide, roll, or fall into the trench and onto workers are stripped prior to entry by workers into an excavation.

4.9.6 While operating heavy equipment in the work area, the equipment operator shall maintain communication with a designated signal person through either direct voice contact or approved standard hand signals.

4.9.7 When mobile equipment is operated adjacent to an excavation or when such equipment is required to approach the edge of an excavation and the operator does not have a clear and direct view of the edge of the excavation, a warning system such as barricades, hand or mechanical signals, or stop logs shall be used. If possible, the grade should be away from the excavation.

4.9.8 All site personnel should maintain a safe distance and remain clear of the swing of operating excavation equipment.

- 4.9.9 Employees shall be required to stand away from any vehicle being loaded or unloaded to avoid being struck by any spillage or falling materials. Operators may remain in the cabs of vehicles being loaded or unloaded when the vehicles are equipped to provide adequate protection for the operator during loading and unloading operations.
- 4.9.10 All site personnel that operate or work in the vicinity of heavy equipment shall wear all AECOM-required safety equipment.
- 4.9.11 All materials such as pipe, rebar, etc., shall be kept out of traffic lanes and access ways. Materials and equipment shall be stored in a designated area so as not to endanger personnel at any time.
- 4.9.12 A flagman with roadwork, signs, cones, and high-level warning signs shall be provided when it is necessary to control normal vehicular traffic due to vehicles, such as end-dumps, entering, or leaving the site.
- 4.10 Work Within the Trench/Excavation**
- 4.10.1 Employees shall not work in excavations in which there is accumulated water or in excavations in which water is accumulating, unless adequate precautions have been taken to protect employees against the hazards posed by water accumulation. The precautions necessary to protect employees adequately vary with each situation, but could include special support or shield systems to protect from cave-ins, water removal to control the level of accumulating water, or use of a safety harness and lifeline.
- 4.10.2 A stairway, ladder, ramp, or other safe means of egress shall be located in excavations or trenches that are 4 feet (1.22 m) or more in depth so as to require no more than 25 feet (7.62 m) of lateral travel for employees. Ladders should extend at least 3 feet (0.75m) above the trench top.
- 4.10.3 Structural ramps that are used solely by employees as a means of access or egress from excavations shall be designed by a competent person. Structural ramps used for access or egress of equipment shall be designed by a competent person qualified in structural design and shall be constructed in accordance with the design.
- 4.10.4 Ramps and runways constructed of two or more structural members shall have the structural members connected together to prevent displacement. Structural members used for ramps and runways shall be of uniform thickness. Cleats or other appropriate means used to connect runway structural members shall be attached to the bottom of the runway or shall be attached in a manner to prevent tripping. Structural ramps used in lieu of steps shall be provided with cleats or other surface treatments on the top surface to prevent slipping.
- 4.11 Hazardous Atmospheres**
- 4.11.1 Confined spaces may exist in excavations where there is limited access or egress and in which a hazardous gas, vapor, dust, or fume or an oxygen-deficient atmosphere may occur.
- 4.11.2 To prevent exposure to harmful levels of atmospheric contaminants, entry into trenches and excavations greater than 5 feet/1.5m in depth in which a hazardous atmosphere exists, or could reasonably be expected to exist, such as in excavations in landfill areas or excavations in areas where hazardous substances are stored nearby, entry must be performed in accordance with the requirements specified in *S3NA-301-PR Confined Spaces*.
- 4.11.3 Adequate precautions, such as mechanical ventilation or appropriate respiratory protection, shall be taken prior to entry into trenches and excavations in which the oxygen concentration is less than 19.5 percent or the concentration of flammable gases or vapors is in excess of 10 percent of the lower explosive limit (LEL).
- 4.11.4 When controls are used that are intended to reduce the level of atmospheric contaminants to acceptable levels, testing shall be conducted as often as necessary to confirm that the atmosphere remains safe. Atmospheric testing will be conducted in the anticipated breathing zone of the work area to determine oxygen content, combustible gas, and toxic gases and vapors, if applicable.
- 4.11.5 Appropriate respiratory protection shall be donned prior to entry into any trench or excavation in which airborne levels of toxic substances are present at concentrations in excess of their Threshold Limit Value (TLV) or Permissible Exposure Limit (PEL).
- 4.11.6 If a confined space is identified, emergency rescue procedures will be in place in accordance with *S3NA-301-PR Confined Spaces*.

4.12 Stability of Adjacent Structures

- 4.12.1 Where the stability of adjoining buildings, walls, or other structures is endangered by excavation operations, support systems such as shoring, bracing, or underpinning shall be provided to ensure the stability of such structures for the protection of employees.
- 4.12.2 Excavation below the level of the base or footing of any foundation or retaining wall that could be reasonably expected to pose a hazard to employees shall not be permitted except when
- A support system, such as underpinning, is provided to ensure the safety of employees and the stability of the structure; or
 - The excavation is in stable rock; or
 - A registered professional engineer has approved the determination that the structure is sufficiently removed from the excavation so as to be unaffected by the excavation activity; or
 - A registered professional engineer has approved the determination that such excavation work will not pose a hazard to employees.
- 4.12.3 In addition, sidewalks, pavements, and appurtenant structures shall not be undermined unless a support system or another method of protection is provided to protect employees from the possible collapse of such structures.

4.13 Inspections

- 4.13.1 Daily inspections of excavations, the adjacent areas, and protective systems shall be made by a competent person for evidence of a situation that could result in possible cave-ins, indications of failure of protective systems, hazardous atmospheres, or other hazardous conditions.
- 4.13.2 An inspection shall be conducted by the competent person prior to the start of work and as needed throughout the shift. Inspections shall also be made after every rainstorm or other hazard-increasing occurrence. These inspections are only required when employee exposure can be reasonably anticipated.
- 4.13.3 Where the competent person finds evidence of a situation that could result in a possible cave-in, indications of failure of protective systems, hazardous atmospheres, or other hazardous conditions, exposed employees shall be removed from the hazardous area until the necessary precautions have been taken to ensure their safety.

4.14 Personal Protective Equipment

- 4.14.1 Hard hats
- 4.14.2 Steel-toed boots
- 4.14.3 Reflective vest
- 4.14.4 Respiratory equipment, as required
- 4.14.5 Safety glasses with side shields

4.15 Special Excavation Entry Permit Required for California

- 4.15.1 In California, for the construction of trenches or excavations that are 5 feet/1.5 m or deeper and into which a person is required to descend, an additional permit must be obtained from Cal/OSHA.

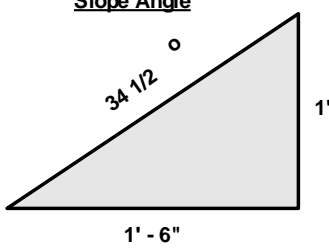

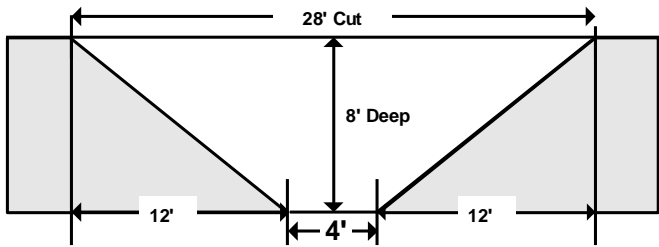

5.0 Records

- 5.1 Completed Daily Excavation Checklist—must be retained for +1 year

6.0 References

- 6.1 None

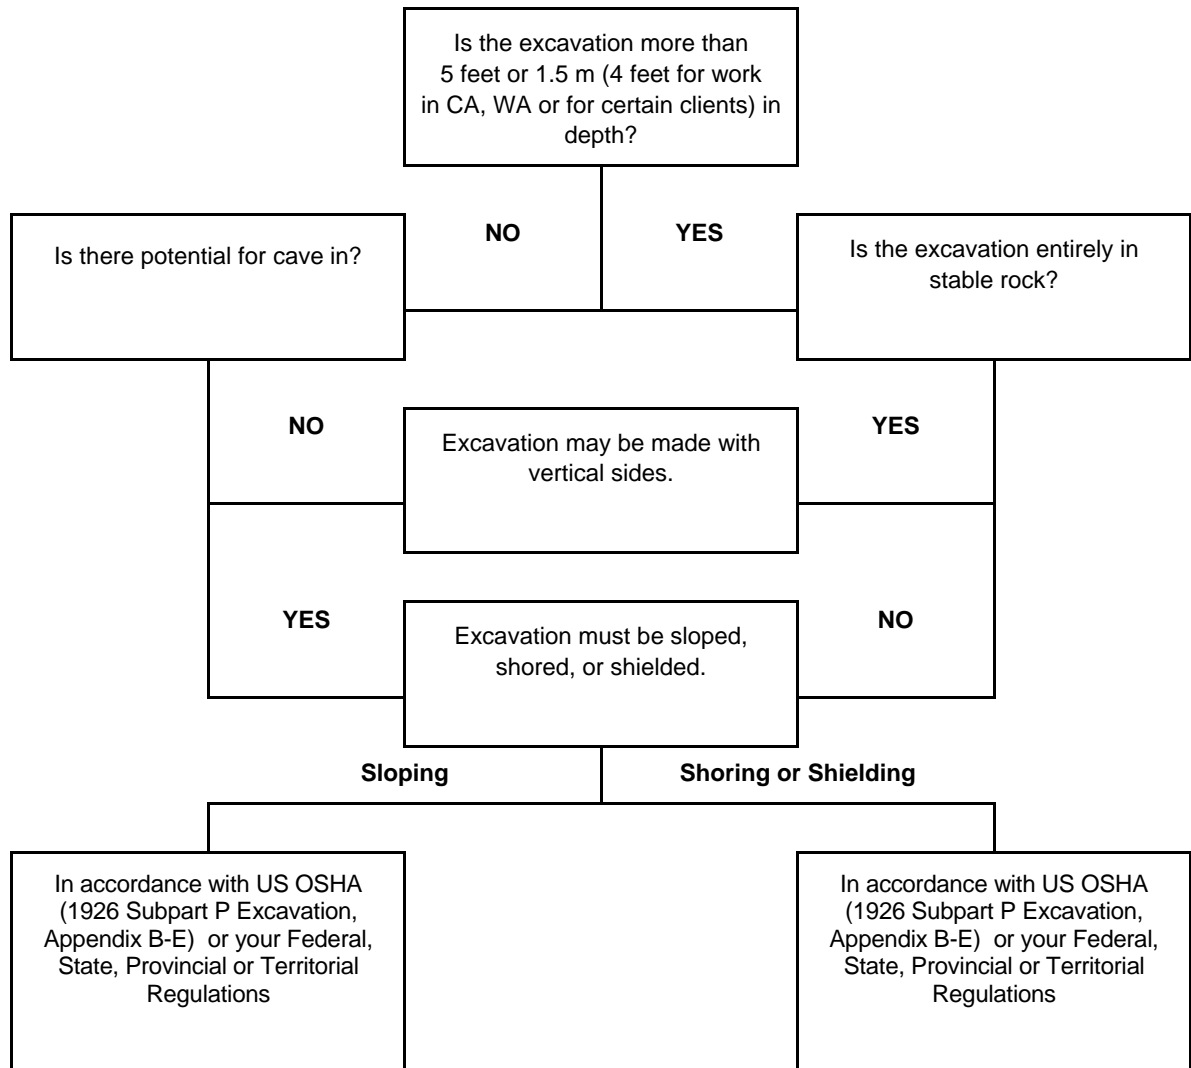

S3NA-303-FM Daily Excavation Checklist

Daily Excavation Checklist			
Competent Person:		Date:	
Site Location:		Job Number:	
Soil Type:	Excavation Depth:	Excavation Width:	
Type of Protective System Used:			
Indicate for each item: Yes – No – or N/A for not applicable:			
1. General Information:	Yes	No	N/A
A. Is excavation less than five feet in depth?			
B. Is there a potential for a cave-in? *IF YES, excavation must be sloped, shored, or shielded.			
C. Is excavation deeper than 5 feet? * IF YES, excavation must be sloped, shored, or shielded.			
D. Is sloping used as your protective system?			
<p style="text-align: center;"><u>Slope information to keep in mind:</u></p> <div style="display: flex; justify-content: space-around; align-items: flex-end;"> <div style="text-align: center;"> <p><u>Slope Angle</u></p>  <p>1' - 6"</p> </div> <div style="text-align: center;">  <p>Example of a Simple 34-degree Slope commonly used around the site for cave-in protection.</p> </div> </div>			
E. 1- Manual and 1- Visual Method utilized to determine Soil Classification as A-B-C.			
2. Inspection of Job Site	Yes	No	N/A
A. Excavations, adjacent areas, and protective systems inspected by a competent person daily before the start of work.			
B. Competent person has the authority to remove all individuals from the excavation immediately.			
C. Surface encumbrances removed or supported.			
D. All individuals protected from loose rock or soil that could pose a hazard by falling or rolling into the excavation.			
E. Hard hats, safety-toed boots, and safety glasses worn by all individuals.			

F. Spoils, materials, and equipment set back at least 2 feet from the edge of the excavation.			
G. Adequate barriers provided at all excavations, wells, pits, shafts, etc.			
H. Warning vests or other highly visible clothing provided and worn by all individuals. Wearing a vest at all times around heavy equipment is required.			
I. All individuals are required to stand away from vehicles being loaded or unloaded.			
J. Warning system established and utilized when mobile equipment is operating near the edge of the excavation (e.g., barricade tape, signalpersons, stop logs, etc).			
K. All individuals prohibited from going under suspended loads.			
3. Utilities	Yes	No	N/A
A. Location of utilities marked.			
B. Prior to the use of equipment, underground utilities have been located by hand digging.			
C. Underground utilities are protected, supported, or removed when excavation is open.			
4. Means of Access and Egress:	Yes	No	N/A
A. Travel distance to means of egress no greater than 25 feet in excavations 4 feet or more in depth.			
B. Straight ladders used in excavations extend at least 3 feet above the edge of the trench.			
C. Ramps being used for employee access have been designed by the competent person.			
D. All individuals are protected from cave-ins when entering or exiting the excavation.			
5. Wet Conditions:	Yes	No	N/A
A. Precautions have been taken to protect all individuals from the accumulation of water.			
B. Water removal equipment monitored by a competent person.			
C. Surface water or runoff is diverted or controlled to prevent accumulation in the excavation.			
D. Inspections have been made after every rainstorm or other hazard-increasing occurrence (freeze/thaw, local demolition, rerouting of traffic, etc).			
6. Hazardous Atmosphere: The atmosphere within the excavation must be tested where there is a reasonable possibility of an oxygen deficiency or a combustible or other harmful contaminant exposing any individual to a hazard.	Yes	No	N/A
A. Are there exposed sewer or natural gas lines in excavation?			
B. Is excavation near a landfill area, or are hazardous substances being stored close to the excavation?			
If you answered YES to A or B, then treat the excavation as a confined space. See S3NA-301-PR Confined Spaces			
C. All individuals will contact the Fire/Rescue Group at _____ prior to entry and in case of emergencies.			
7. Support Systems:	Yes	No	N/A
A. Materials and/or equipment for support systems are selected based on soil analysis, trench depth, and expected loads.			

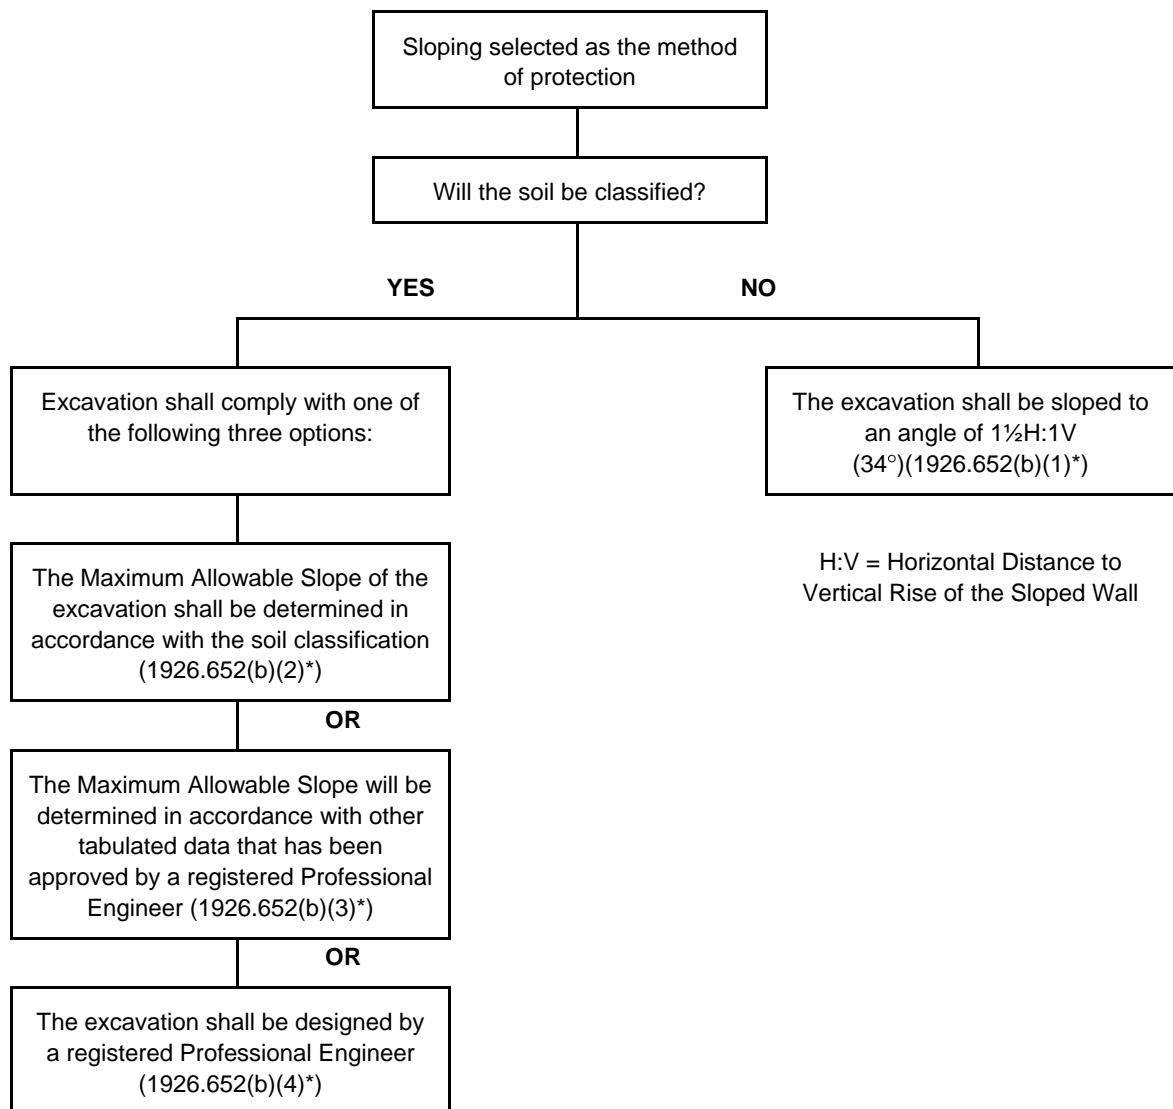

B. Materials and equipment used for protective systems have been inspected and are in good condition.			
C. Materials and equipment not in good condition have been removed from service.			
D. Protective systems installed without exposing all individuals to the hazards of cave-ins, collapses, or the threat of being struck by materials or equipment.			
E. Members of support system are securely fastened to prevent failure.			
F. Support systems are provided to ensure stability of adjacent structures, buildings, roadways, sidewalks, walls, etc.			
G. Excavations below the level of the base of a footing have been approved by a registered Professional Engineer.			
H. Removal of support systems progresses from the bottom, and members are released slowly so that you can note any indication of possible failure.			
I. Backfilling progresses with the removal of the support system.			
J. Material is excavated to a level no greater than 2 feet below the bottom of the support system and only if the system is designed to support the loads calculated for the full depth.			
K. A shield system has been placed to prevent lateral movement.			
M. All individuals are prohibited from remaining in the shield system during vertical movement.			
8. Training:	Yes	No	N/A
A. All individuals have had Excavation Safety Awareness Training.			

S3NA-303-WI1 Selection of Protective Systems

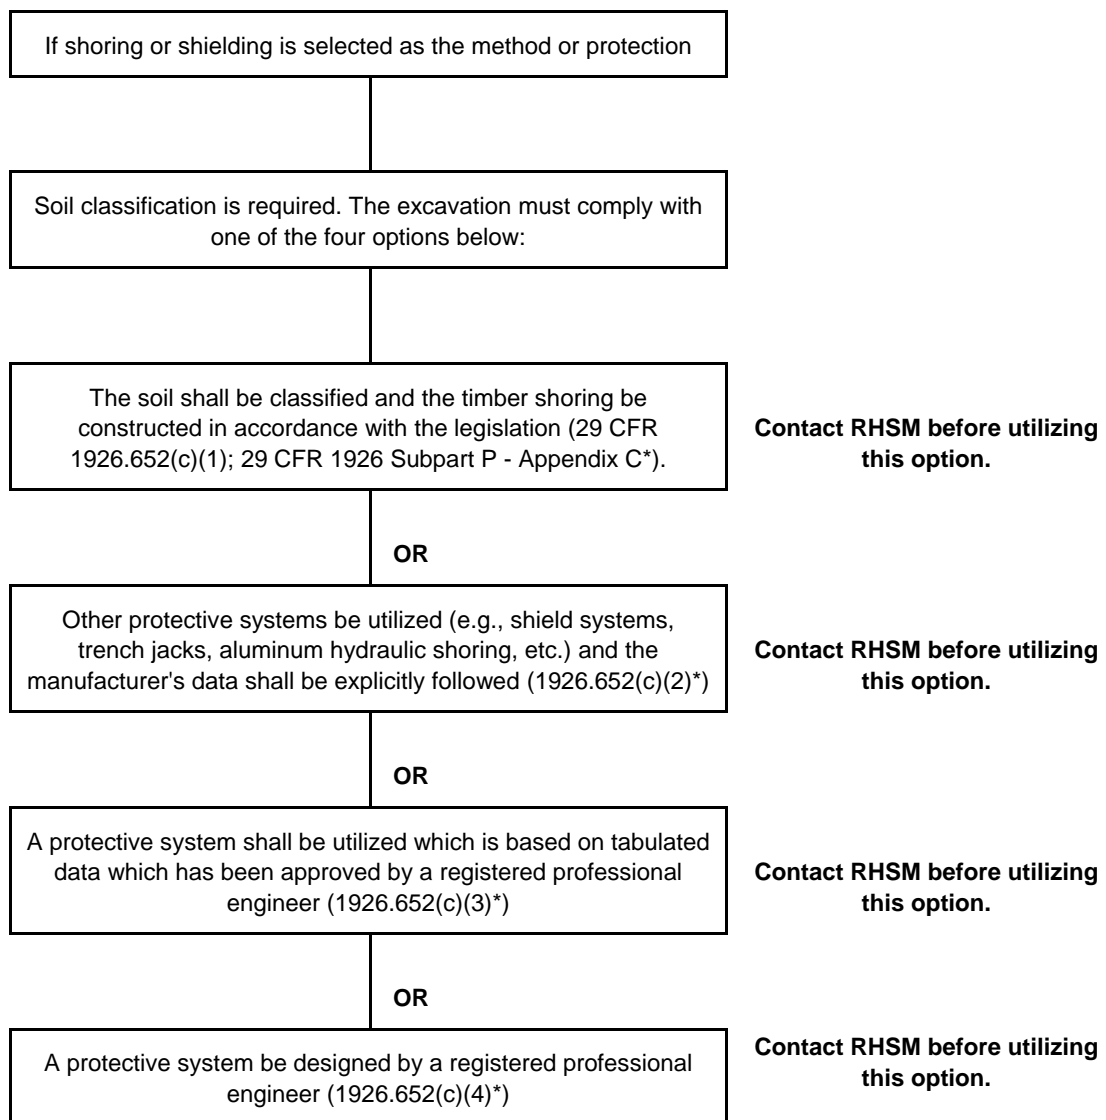

⁽¹⁾ Protective systems for excavations greater than 20 feet in depth must be designed by a registered professional engineer in accordance with 1926.652 (b) and (c) in the United States.

S3NA-303-WI2 Sloping Options

**Please refer to your provincial, territorial, for local requirements.*

S3NA-303-WI3 Shoring or Shielding Options

**Please refer to your provincial, territorial, for local requirements.*

S3NA-303-WI4 Factors Affecting Shoring Methods

Factor	Description
Soil Structure and Strength	Trench walls, at first glance, may appear to have strength, particularly if rock is encountered. Fractures in the rock can develop because of construction and soil strength may fail when subjected to undercutting or high-energy impacts. Irregular slopes on stratified soils that appear stable can fail if lower materials do not have adequate strength.
Soil Moisture Content	Soil may be moist even though the weather has been dry. Care must be taken and shoring provided if the soil appears to be moist.
Weather and Humidity	These can have a significant impact on shoring requirements. Frozen stable soil may collapse if warm mild weather persists. Percolation of water into the soil can increase the load on the shoring due to the increased weight and mobility of saturated soils. Frozen ground does not preclude the need to install shoring unless the freezing process is designed and approved by a Professional Engineer.
Soil Stress	Stress can originate from many sources. Heavy machinery passing close to the shoring creates vibrations that decrease the soil strength and can result in shoring failure. Stationary equipment at the edges of the excavation can transmit loads and additional stresses to the shoring.
Trench Depth and Width	These directly influence the choice of materials and the spacing of support bracing. The shoring requirements of a wide and deep trench differ substantially from those of a narrower trench.
Erosion Time	If excavations are to be left for extended periods, shoring materials may have to be increased.

S3NA-305-PR Hand and Power Tools

1.0 Purpose and Scope

- 1.1 Provides the AECOM requirements for all manually-operated hand and power tools and equipment use, handling and storage.
- 1.2 This procedure applies to all AECOM North America based employees and operations.

2.0 Terms and Definitions

- 2.1 None

3.0 Attachments

- 3.1 S3NA-305-GL Hand and Power Tools Guide

4.0 Procedure

4.1 Roles and Responsibilities

- 4.1.1 **Project Managers/Field Task Managers/Supervisors.** Each **Manager/Supervisor** must ensure that all aspects of this procedure are followed and adhered to on all AECOM projects, sites and locations. If a specific tool is not included in this work instruction section of this SOP, appropriate guidelines shall be established prior to work associated with that equipment, including following manufacturer's recommendations.
- 4.1.2 **Region SH&E Manager** provides technical guidance and support as to this procedure.
- 4.1.3 **Employees.** **Employees** shall not work with any tool that they are not familiar with without first obtaining training associated with that equipment. In addition, **employees** must following manufacturer's recommendations for its use and must not modify the equipment without first obtaining authorization from the manufacturer.

4.2 **Restrictions**

- 4.2.1 No **employee** shall use any hand tool, unless they are familiar with the use and operation of the equipment or have received specific instruction on its use and operation.
- 4.2.2 All tools will be used in accordance with manufacturer's specifications.

4.3 **Training**

- 4.3.1 Instruction in the proper use, safe handling, and maintenance of tools will be provided to employees unfamiliar with the tool.

4.4 **Personal Protective Equipment**

- 4.4.1 Lockout devices (padlocks, multiple lock hasps, tags), gloves appropriate to the task, safety-toed boots, as required, hard hats and eye & face protection, as required.

4.5 **Inspections**

- 4.5.1 All tools must be inspected prior to each use. Any tool that is defective or has missing parts must not be used. Every broken or defective tool must be tagged or identified as such. Tagged tools will be returned to your supervisor for repair or replacement. Tagged tools will be immediately removed from service.
- 4.5.2 All tools must be inspected to manufacture's specifications according to tool rests and guard adjustment tolerances. All tools will be inspected to ascertain that all safety devices are present and functioning properly.

5.0 **Records**

- 5.1 None

6.0 **References**

- 6.1 S3NA-208-PR Personal Protective Equipment Program
- 6.2 S3NA-302-PR Electrical, General
- 6.3 S3NA-305-GL1 Hand and Power Tools
- 6.4 S3NA-410-PR Hazardous Energy Control
- 6.5 S3NA-510-PR Hearing Conservation Program

S3NA-305-GL Hand and Power Tools

1.0 Exposure

- 1.1 Employees who use hand and power tools and are exposed to the hazards of falling, flying, abrasive, and splashing objects, or to harmful dusts, fumes, mists, vapors, or gases must be provided with the appropriate personal protective equipment.

2.0 Basic Safety rules

- 2.1 Keep all tools in good condition with regular maintenance.
- 2.2 Use the right tool for the job.
- 2.3 Examine each tool for damage before use and do not use damaged tools.
- 2.4 Operate tools according to the manufacturers' instructions.
- 2.5 Provide and use properly the right personal protective equipment.
- 2.6 All electrical connections for these tools must be suitable for the type of tool and the working conditions (wet, dusty, flammable vapors).
- 2.7 When a temporary power source is used for construction a ground-fault circuit interrupter should be used
- 2.8 Eye protection is required, and head and face protection is recommended for employees working with pneumatic tools.
- 2.9 Screens must also be set up to protect nearby workers from being struck by flying fragments around chippers, riveting guns, staplers, or air drills.
- 2.10 Compressed air guns should never be pointed toward anyone.
- 2.11 Workers should never "dead-end" them against themselves or anyone else.
- 2.12 A chip guard must be used when compressed air is used for cleaning.
- 2.13 Use of heavy jackhammers can cause fatigue and strains. Heavy rubber grips reduce these effects by providing a secure handhold.
- 2.14 Workers operating a jackhammer must wear safety glasses and safety shoes that protect them against injury if the jackhammer slips or falls. A face shield also should be used.
- 2.15 Noise hazard associated with pneumatic tools. Working with noisy tools such as jackhammers requires proper, effective use of appropriate hearing protection.

3.0 Hazard Prevention Sharp Objects

- 3.1 Employees, when using saw blades, knives, or other tools, should direct the tools away from aisle areas and away from other employees working in close proximity.
- 3.2 Knives and scissors must be sharp; dull tools can cause more hazards than sharp ones.
- 3.3 Cracked saw blades must be removed from service.
- 3.4 Wrenches must not be used when jaws are sprung to the point that slippage occurs.
- 3.5 Impact tools such as drift pins, wedges, and chisels must be kept free of mushroomed heads.
- 3.6 The wooden handles of tools must not be splintered.
- 3.7 Iron or steel hand tools may produce sparks that can be an ignition source around flammable substances. Where this hazard exists, spark-resistant tools made of non-ferrous materials should be used where flammable gases, highly volatile liquids, and other explosive substances are stored or used.

4.0 Hazard Prevention of Power tools

4.1 Precautions

- 4.1.1 Never carry a tool by the cord or hose.
- 4.1.2 Never yank the cord or the hose to disconnect it from the receptacle.
- 4.1.3 Keep cords and hoses away from heat, oil, and sharp edges.
- 4.1.4 Disconnect tools when not using them, before servicing and cleaning them, and when changing accessories such as blades, bits, and cutters.
- 4.1.5 Keep all people not involved with the work at a safe distance from the work area.
- 4.1.6 Secure work with clamps or a vise, freeing both hands to operate the tool.
- 4.1.7 Avoid accidental starting. Do not hold fingers on the switch button while carrying a plugged-in tool.
- 4.1.8 Maintain tools with care; keep them sharp and clean for best performance.
- 4.1.9 Follow instructions in the user's manual for lubricating and changing accessories.
- 4.1.10 Be sure to keep good footing and maintain good balance when operating power tools.
- 4.1.11 Wear proper apparel for the task. Loose clothing, ties, or jewelry can become caught in moving parts.
- 4.1.12 Remove all damaged portable electric tools from use and tag them: "Do Not Use."

4.2 Guards

- 4.2.1 The exposed moving parts of power tools need to be safeguarded. Belts, gears, shafts, pulleys, sprockets, spindles, drums, flywheels, chains, or other reciprocating, rotating, or moving parts of equipment must be guarded.
- 4.2.2 Machine guards, as appropriate, must be provided to protect the operator and others from the following:
 - Point of operation.
 - In-running nip points.
 - Rotating parts.
 - Flying chips and sparks.
- 4.2.3 Safety guards must never be removed when a tool is being used. Portable circular saws having a blade greater than 2 inches (5.08 centimeters) in diameter must be equipped at all times with guards.
- 4.2.4 An upper guard must cover the entire blade of the saw.
- 4.2.5 A retractable lower guard must cover the teeth of the saw, except where it makes contact with the work material. The lower guard must automatically return to the covering position when the tool is withdrawn from the work position.

5.0 Operating Controls and Switches

- 5.1 The following hand-held power tools must be equipped with a constant-pressure switch or control that shuts off the power when pressure is released: drills; tappers; fastener drivers; horizontal, vertical, and angle grinders with wheels more than 2 inches (5.08 centimeters) in diameter; disc sanders with discs greater than inches (5.08 centimeters); belt sanders; reciprocating saws; saber saws, scroll saws, and jigsaws with blade shanks greater than 1/4-inch (0.63 centimeters) wide; and other similar tools.
- 5.2 These tools also may be equipped with a "lock-on" control, if it allows the worker to also shut off the control in a single motion using the same finger or fingers.
- 5.3 The following hand-held power tools must be equipped with either a positive "on-off" control switch, a constant pressure switch, or a "lock-on" control:
 - 5.3.1 Disc sanders with discs 2 inches (5.08 centimeters) or less in diameter.
 - 5.3.2 Grinders with wheels 2 inches (5.08 centimeters) or less in diameter.

- 5.3.3 Platen sanders, routers, planers, laminate trimmers, nibblers, shears, and scroll saws; and jigsaws, saber and scroll saws with blade shanks a nominal 1/4-inch (6.35 millimeters) or less in diameter.
- 5.3.4 It is recommended that the constant-pressure control switch be regarded as the preferred device.
- 5.3.5 Other hand-held power tools such as circular saws having a blade diameter greater than 2 inches (5.08 centimeters), chain saws, and percussion tools with no means of holding accessories securely must be equipped with a constant-pressure switch.

6.0 Electrical Shock Caution

- 6.1 Electrical shocks, which can lead to injuries such as heart failure and burns, are among the major hazards associated with electricpowered tools. Under certain conditions, even a small amount of electric current can result in fibrillation of the heart and death.
- 6.2 An electric shock also can cause the user to fall off a ladder or other elevated work surface and be injured due to the fall.
- 6.3 To protect the user from shock and burns, electric tools must have a three-wire cord with a ground and be plugged into a grounded receptacle, be double insulated, or be powered by a lowvoltage isolation transformer.
- 6.4 Three-wire cords contain two currentcarrying conductors and a grounding conductor. Any time an adapter is used to accommodate a two-hole receptacle, the adapter wire must be attached to a known ground.
- 6.5 The third prong must never be removed from the plug.
- 6.6 Double-insulated tools are available that provide protection against electrical shock without third-wire grounding. On doubleinsulated tools, an internal layer of protective insulation completely isolates the external housing of the tool.

7.0 Electric Tools General Practice

- 7.1 Operate electric tools within their design limitations.
- 7.2 Use gloves and appropriate safety footwear when using electric tools.
- 7.3 Store electric tools in a dry place when not in use.
- 7.4 Do not use electric tools in damp or wet locations unless they are approved for that purpose.
- 7.5 Keep work areas well lighted when operating electric tools. Ensure that cords from electric tools do not present a tripping hazard.
- 7.6 In the construction industry, employees who use electric tools must be protected by ground-fault circuit interrupters or an assured equipment-grounding conductor program.

8.0 Pneumatic Tools (powered by compressed air)

- 8.1 There are several dangers associated with the use of pneumatic tools. First and foremost is the danger of getting hit by one of the tool's attachments or by some kind of fastener the worker is using with the tool.
- 8.2 Pneumatic tools must be checked to see that the tools are fastened securely to the air hose to prevent them from becoming disconnected.
- 8.3 A short wire or positive locking device attaching the air hose to the tool must also be used and will serve as an added safeguard.
- 8.4 If an air hose is more than 1/2-inch (12.7 millimeters) in diameter, a safety excess flow valve must be installed at the source of the air supply to reduce pressure in case of hose failure.
- 8.5 In general, the same precautions should be taken with an air hose that are recommended for electric cords, because the hose is subject to the same kind of damage or accidental striking, and because it also presents tripping hazards.
- 8.6 When using pneumatic tools, a safety clip or retainer must be installed to prevent attachments such as chisels on a chipping hammer from being ejected during tool operation.

- 8.7 Pneumatic tools that shoot nails, rivets, staples, or similar fasteners and operate at pressures more than 100 pounds per square inch (6,890 kPa), must be equipped with a special device to keep fasteners from being ejected, unless the muzzle is pressed against the work surface.
- 8.8 Airless spray guns that atomize paints and fluids at pressures of 1,000 pounds or more per square inch (6,890 kPa) must be equipped with automatic or visible manual safety devices that will prevent pulling the trigger until the safety device is manually released.

9.0 Liquid Fuel Tools (operated with gasoline)

- 9.1 The worker must be careful to handle, transport, and store gas or fuel only in approved flammable liquid containers, according to proper procedures for flammable liquids.
- 9.2 Before refilling a fuel-powered tool tank, the user must shut down the engine and allow it to cool to prevent accidental ignition of hazardous vapors.
- 9.3 When a fuel-powered tool is used inside a closed area, effective ventilation and/or proper respirators such as atmosphere-supplying respirators must be utilized to avoid breathing carbon monoxide.
- 9.4 Noise hazards associated with gasoline engines must be mitigated by proper hearing protection utilization. Ear Plugs, ear muffs or a combination of the two must be used to protect workers from excessive noise levels.
- 9.5 Fire extinguishers must also be available in the area.

10.0 Hydraulic Power Tools (fluid run)

- 10.1 The fluid used in hydraulic power tools must be an approved fire-resistant fluid and must retain its operating characteristics at the most extreme temperatures to which it will be exposed. The exception to fire-resistant fluid involves all hydraulic fluids used for the insulated sections of derrick trucks, aerial lifts, and hydraulic tools that are used on or around energized lines. This hydraulic fluid shall be of the insulating type.
- 10.2 The manufacturer's recommended safe operating pressure for hoses, valves, pipes, filters, and other fittings must not be exceeded.
- 10.3 All jacks—including lever and ratchet jacks, screw jacks, and hydraulic jacks—must have a stop indicator, and the stop limit must not be exceeded. Also, the manufacturer's load limit must be permanently marked in a prominent place on the jack, and the load limit must not be exceeded.
- 10.4 A jack should never be used to support a lifted load. Once the load has been lifted, it must immediately be blocked up. Put a block under the base of the jack when the foundation is not firm, and place a block between the jack cap and load if the cap might slip.
- 10.5 To set up a jack, make certain of the following:
 - 10.5.1 The base of the jack rests on a firm, level surface;
 - 10.5.2 The jack is correctly centered;
 - 10.5.3 The jack head bears against a level surface; and
 - 10.5.4 The lift force is applied evenly.
- 10.6 Proper maintenance of jacks is essential for safety. All jacks must be lubricated regularly. In addition, each jack must be inspected according to the following schedule:
 - 10.6.1 For jacks used continuously or intermittently at one site—inspected at least once every 6 months;
 - 10.6.2 For jacks sent out of the shop for special work—inspected when sent out and inspected when returned; and
 - 10.6.3 For jacks subjected to abnormal loads or shock—inspected before use and immediately thereafter.

S3NA-305-WI1 Chainsaw Safety Card

1.0 Objective / Overview

- 1.1 Available in a variety of types and capacities, chainsaws are one of the most powerful, yet dangerous cutting tools available.
- 1.2 Working safely with a chain saw begins with training.
- 1.3 Additional safety measures include proper training, good body mechanics and felling technique, well-maintained equipment, and protective clothing.

2.0 Safe Operating Guidelines

- 2.1 A sharp chainsaw is safer than a dull one. Keep the saw clean, lubricated, and adjusted. Before starting work inspect and test the chain brake, chain catch, throttle lock, handles and guards, all nuts and bolts, spark arrestor, and muffler and air filter. The chain tension should be properly adjusted and the carburetor tuned. Never "drop start" the saw.
- 2.2 A chainsaw is not only dangerous to the operator but to those around him. Keep the saw close to the body. Bend from the knees, not the waist. Improper lifting techniques and poor posture contribute to injuries.

3.0 Potential Hazards

- 3.1 Kickback – Sudden and violent reverse movement of the saw
- 3.2 Hand / arm vibration syndrome
- 3.3 Flying / falling debris
- 3.4 Severe cuts

4.0 Training Requirements

- 4.1 Review of Applicable SOPs
- 4.2 Demonstrated knowledge on the use of a chainsaw
- 4.3 Review of manufacturers operating guidelines

5.0 Personal Protective Equipment (Level D PPE)

- 5.1 Debris Shield
- 5.2 Chainsaw Chaps
- 5.3 Leather Gloves
- 5.4 Hearing Protection

6.0 Other Safety Tips

- 6.1 Always avoid standing on the log and making cuts with the saw between your legs; always cut with the saw to the outside of your legs.
- 6.2 Determine where the tree/limb will fall prior to cutting. Always ensure that personnel and equipment are not in the path the falling tree/log, and that you have time to move away. If necessary, flag/or fence off the area to prevent entry.

- 6.3 Always stand to one side of the limb you are to cut, never straddle it.
- 6.4 Always keep in mind where the chain will go if it breaks, never position yourself or other people in line with the chain.
- 6.5 Keep the chain out of the dirt, debris will fly, the teeth will be dulled and the chain life shortened.

S3NA-305-WI2 Circular Saw Safety Card

1.0 Objective / Overview

- 1.1 Among professionals, the circular saw is probably the most commonly used powered saw and perhaps the most commonly abused. Familiarity should not breed carelessness.
- 1.2 Safe measures include proper training, good body mechanics and felling technique, well-maintained equipment, and protective equipment.
- 1.3 The circular saw is used in cutting wood products (i.e., plywood, construction lumber, etc.).

2.0 Safe Operating Guidelines

- 2.1 Use sharp blades. Dull blades cause binding, stalling and possible kickback.
- 2.2 Use the correct blade for the application and check for proper operation before each cut.
- 2.3 Check often to ensure that guards return to their normal position quickly. Never defeat the guard to expose the blade.
- 2.4 Before starting a circular saw, be sure the power cord and extension cords are out of the blade path and are long enough to freely complete the cut. A sudden jerk or pulling on the cord can cause loss of control of the saw and a serious accident.
- 2.5 For maximum control, hold the saw firmly with both hands after securing the work piece.
- 2.6 Check frequently to be sure clamps remain secure.
- 2.7 Avoid cutting small pieces that can't be properly secured and material on which the saw shoe can't properly rest.
- 2.8 When you start the saw, allow the blade to reach full speed before contacting the work piece.

3.0 Potential Hazards

- 3.1 Kickback – Sudden and violent reverse movement of the saw
- 3.2 Hearing loss
- 3.3 Flying debris
- 3.4 Severe cuts

4.0 Training Requirements

- 4.1 Review of Applicable SOPs.
- 4.2 Demonstrated knowledge on the use of a circular saw.
- 4.3 Review and follow manufacturer's operating guidelines.

5.0 Personal Protective Equipment (Level D PPE)

- 5.1 Leather Gloves
- 5.2 Hearing Protection

6.0 Other Safety Tips

- 6.1 Circular saws are designed for right-hand operation; left-handed operation will demand more care to operate safely.
- 6.2 Disconnect power supply before adjusting or changing the blade.
- 6.3 Do not place hand under or in front of the shoe or guard of the saw when operating.
- 6.4 Cut at the proper depth (¼ in.) below work surface (see picture).
- 6.5 Circular saw must be double-insulated or protected by a GFCI.

S3NA-305-WI3 Cut Off Saw Safety Card

1.0 Objective / Overview

- 1.1 Cut-off saws are high-speed cutting tools and very dangerous to operate. Therefore, it is very important to review the general safety rules, training, PPE and procedures for working with portable cut off saws.
- 1.2 Cut off saws are used in a variety of activities (i.e. concrete, piping, metal, etc.).

2.0 Safe Operating Guidelines

- 2.1 **Starting** - Start the saw on firm ground or other solid surface in an open area. Never attempt to drop-start the engine. Clear the working area. Avoid operating the saw if the terrain is wet and/or frozen.
- 2.2 **Handling** - Hold the saw firmly with two hands when the engine is running, *and whenever the blade is rotating until it comes to a complete stop*. Carry the saw with engine stopped, muffler away from your body, while protecting the cutting wheel from striking the ground or other objects.
- 2.3 **Cutting** - Begin cutting at full throttle and continue at full throttle until the cut is finished. Avoid standing in a direct line with the cutting wheel. Use only downward pressure on the saw, as lateral pressure may cause the blade to break and shatter. Do not change the direction of the cut once started, as this can also cause the blade to break and shatter. Do not use abrasive-type wheels for rough grinding. Do not cut above shoulder height.
- 2.4 **Maintenance** - Shut off the engine and remove the spark plug wire before adjusting or working on the saw.
- 2.5 Hearing loss
- 2.6 Flying debris
- 2.7 Severe cuts
- 2.8 Burns from engine
- 2.9 Fire Hazard from sparks and gasoline
- 2.10 Hand / arm vibration syndrome

3.0 Potential Hazards

- 3.1 Kickback – Sudden and violent reverse movement of the saw

4.0 Training Requirements

- 4.1 Review of Applicable SOPs
- 4.2 Demonstrated knowledge on the use of a cut off saw
- 4.3 Review and follow manufacturers operating guidelines

302BA058 KN

Never drop-start saw

5.0 Personal Protective Equipment (Level D PPE)

- 5.1 Face shield
- 5.2 Chainsaw Chaps
- 5.3 Leather gloves
- 5.4 Hearing protection: earplugs and/or earmuffs

5.5 Respirator if required (concrete operations)

6.0 Other Safety Tips

- 6.1 Keep flammable and combustible materials away from saw while cutting metal.
- 6.2 Make sure the fuel cap is properly secured.
- 6.3 Inspect the abrasive wheel for cracks and chips. If cracked or chip replace wheel before use.
- 6.4 Ensure guard is positioned properly prior to start-up (*S3NA-411-PR Machine Guarding*).
- 6.5 Never try to drop-start the engine (see picture).

S3NA-305-WI4 Hand-Held Grinder Safety Card

1.0 Objective / Overview

- 1.1 Hand held grinders are high-speed electric- or pneumatic-powered grinding tools used to shape or cut metal, and can be dangerous to operate.
- 1.2 Grinders are used in a variety of activities (i.e., piping installation/repair, metal, restoring, polishing, sharpening, etc.).

2.0 Potential Hazards

- 2.1 Kickback – Sudden and violent reverse movement of the grinder.
- 2.2 Flying debris.
- 2.3 Severe cuts.
- 2.4 Fire Hazard from sparks igniting nearby debris or objects.
- 2.5 Hand / arm vibration syndrome.

3.0 Safe Operating Guidelines

- 3.1 Basic safety rules can help prevent hazards associated with the use of hand-held grinders:
 - 3.1.1 Never carry the tool by the cord (or the hose for pneumatic tools).
 - 3.1.2 Never yank the cord or the hose to disconnect the tool from the receptacle.
 - 3.1.3 Keep cords and hoses away from heat, oil, and sharp edges.
 - 3.1.4 Denergize tools when not in use, before servicing, and when changing accessories such as blades/bits/cutters.
 - 3.1.5 All observers should be kept at a safe distance from the work area.
 - 3.1.6 Always secure work with clamps or a vise, freeing both hands to operate the tool.
 - 3.1.7 Avoid accidental starting; do not hold a finger on the trigger/switch while carrying a powered tool.
 - 3.1.8 Tools should be maintained with care. They should be kept clean and sharp for the best performance. Follow instructions in the user's manual for lubricating and care instructions.
 - 3.1.9 Be sure to keep your footing and maintain proper balance.
 - 3.1.10 The proper apparel should be worn. Loose clothing or jewelry can become caught in moving parts.
 - 3.1.11 Inspect the tool before every use. Damaged tools must be removed from use and tagged "DO NOT USE".

4.0 Training Requirements

- 4.1 Review applicable SOPs.
- 4.2 Demonstrated knowledge on the use of a hand-held grinder.
- 4.3 Follow manufacturers operating guidelines, especially for proper grinding wheel attachment.

5.0 Personal Protective Equipment

- 5.1 Leather gloves
- 5.2 Safety glasses with sideshields
- 5.3 Hearing protection: earplugs and/or earmuffs
- 5.4 Other PPE as necessary for the worksite/activity

6.0 Other Safety Tips

- 6.1 Keep flammable and combustible materials away from the grinder.
- 6.2 Have a fire extinguisher on hand while using grinder.
- 6.3 Inspect the abrasive wheel for cracks and chips. If cracked or chipped replace wheel before use.
- 6.4 Ensure safety guard(s) is positioned properly prior to start-up.
- 6.5 Never clamp a hand held grinder in a vice.

S3NA-305-WI5 Impact Wrench Safety Card

1.0 Objective / Overview

- 1.1 Impact wrenches are mainly used for tire changing but that does not limit their use. They can be used in all applications when a certain amount of torque is needed to loosen or tighten nuts and bolts.
- 1.2 The danger comes in to play when employees try to use the wrong sockets with an air wrench. Employees using air wrenches must have a general understanding of how to use them.

2.0 Safe Operating Guidelines

- 2.1 Drain water from air compressor tank and condensation from air lines.
- 2.2 Disconnect the tool from the air supply before lubricating or changing sockets. Impact wrench sockets and accessories must be used with this tool.
- 2.3 Do not use hand sockets and accessories. Select the required impact socket.
- 2.4 Connect tool to air hose of recommended size. The use of a quick connect set makes connecting easier.
- 2.5 Never use a wire, soft pin, or nail to hold the socket onto the square spindle of the impact wrench.
- 2.6 If the proper retaining device on the tool is broken, the tool should be repaired.
- 2.7 On applications where a low or critical level of torque is required, it is recommended that you impact each fastener lightly, and then perform the final tightening with a hand torque wrench.

3.0 Potential Hazards

- 3.1 Flying debris
- 3.2 Hearing loss
- 3.3 Cuts
- 3.4 Hand / arm vibration syndrome

4.0 Training Requirements

- 4.1 Review of Applicable SOPs.
- 4.2 Demonstrated knowledge on the use of a electric drill.
- 4.3 Review and follow manufacturers operating guidelines.

5.0 Personal Protective Equipment (Level D PPE)

- 5.1 Leather gloves/anti-vibration gloves
- 5.2 Hearing protection

6.0 Other Safety Tips

- 6.1 Be sure no one is below when using the tool in high locations.
- 6.2 The proper fastening torque may differ depending upon the kind or size of the bolt.
- 6.3 Check the torque with a torque wrench.

S3NA-305-WI6 Nail Gun Safety Card

1.0 Objective / Overview

- 1.1 Nail guns are useful tools, but must be handled with care, and have been shown to be the cause of unnecessary injuries when the design of the gun places emphasis on speed, rather than safety.

2.0 Safe Operating Guidelines

- 2.1 Watch out for other crewmembers working near you.
- 2.2 Never let an inexperienced crewmember use a nail gun without supervised training.
- 2.3 Never use bottled gas as a power source for pneumatic tools.
- 2.4 Disconnect a nail gun before you service it.
- 2.5 Hold your hand a good 12 inches back from the ends of studs or joists when you are nailing.
- 2.6 Keep the gun properly aligned with your work both vertically and horizontally.
- 2.7 Never nail with the gun pointed toward you or anyone else on the job.
- 2.8 Never try to nail beyond your reach.

3.0 Potential Hazards

- 3.1 Flying debris/nails
- 3.2 Imbedded object
- 3.3 Puncture wounds

4.0 Training Requirements

- 4.1 Review of Applicable SOPs.
- 4.2 Demonstrated knowledge on the use of a coring machine.
- 4.3 Review and follow manufacturers operating guidelines.

5.0 Personal Protective Equipment (Level D PPE)

- 5.1 Leather gloves
- 5.2 Hearing protection

6.0 Other Safety Tips

- 6.1 When you are moving about the work area - keep your finger off the trigger until you are ready to fire. Make sure you have only placed the nose guard against the material you are going to nail together.
- 6.2 Never rest the gun against any part of your body, or try to climb a ladder with the gun cradled against your body.
- 6.3 Be aware of what is located behind the nailing surface. Never place hands or other body parts directly behind the nailing surface.
- 6.4 Use only for intended work.
- 6.5 Avoid nailing into knots as nail can splinter wood.
- 6.6 Never disable safety tip on gun.

S3NA-305-WI7 Pentak Vacuum Safety Card

1.0 Objective / Overview

- 1.1 Pentek's dustless decontamination system removes and packages surface contamination from concrete and steel structures.
- 1.2 The Pentek integrated suite of manually operated equipment (e.g., squirrel III, corner cutter, roto-peen, and crack chaser) is designed for the safe removal of radioactive materials, lead-based paints, PCBs, pesticides, chemical residues, and other contaminated coatings.
- 1.3 The Pentek system incorporates a high-performance vacuum and waste packaging unit, the VAC-PAC, in conjunction with pneumatically operated equipment to remove contaminated material. Dust and debris are captured at the cutting tool surface. Supporting equipment required to operate the unit includes a 60 kW generator and an air compressor (minimum 350 ft³ capacity), as well as a drum grapple for drum handling activities.

Worker is using the roto-peen (scabblers) attachment; VAC-PAC collection system shown with 55 gal drum.

2.0 Safe Operating Guidelines

- 2.1 Prior to use, a pre-operation inspection must be completed to determine if the unit is in safe working condition.
- 2.2 The vacuum unit should be placed a minimum of 50 feet away from the work area.
- 2.3 Once in position to begin work, apply the brake to stabilize the unit. When raising the VAC-PAC to insert/remove a drum, do not place your body or any extremity under the VAC-PAC while it is in the raised position.
- 2.4 Two workers should be used to maneuver the unit into place.
- 2.5 A minimum 10 ft clearance will be established around the unit while in operation.
- 2.6 Workers should be aware of their position in relation to the hoses and cable to minimize tripping hazards.
- 2.7 A competent person will train each worker in the operation of the unit.
- 2.8 Maintenance in excess of preventive maintenance activities (e.g., lubrication) will be performed by manufacturer personnel ONLY.

3.0 Potential Hazards

- 3.1 Hazardous noise
- 3.2 Vibration
- 3.3 Tripping hazard from cables and hoses
- 3.4 Hot surfaces (vacuum unit)
- 3.5 Electrical (high voltage)
- 3.6 Pinch hazard
- 3.7 Back strain
- 3.8 High pressure air

4.0 Personal Protective Equipment (Level D ensemble)

- 4.1 Leather gloves (maintenance)

- 4.2 Tyvek suit (with hood)
- 4.3 Vibration gloves (operation)
- 4.4 Hearing protection (plugs or muffs)

5.0 Other Safety Tips

- 5.1 Always know where the emergency stop is located.
- 5.2 Operators of a motorized drum grapppler must be trained IAW the powered industrial truck standard.
- 5.3 Review *S3NA-302-PR Electrical, General* prior to refueling the electrical generator and/or compressor.

S3NA-305-WI8 Power Drill Safety Card

1.0 Objective / Overview

- 1.1 Available in a variety of types and capacities, portable power drills are undoubtedly the most used power tools.
- 1.2 Because of their handiness and application to a wide range of jobs, drills often receive heavy use. For this reason, you'll need to carefully check your drill's capacity limitations and accessory recommendations.

2.0 Safe Operating Guidelines

- 2.1 Check carefully for loose power cord connections and frays or damage to the cord.
- 2.2 Replace damaged tool and extension cords immediately.
- 2.3 Be sure the chuck is tightly secured to the spindle. This is especially important on reversible type drills. Tighten the bit securely as described by the owner / operators manual.
- 2.4 The chuck key must be removed from the chuck before starting the drill.
- 2.5 A flying key can be an injury-inflicting missile.
- 2.6 Check auxiliary handles, if part of the tool. Be sure they are securely installed.
- 2.7 Always use the auxiliary drill handle when provided. It gives you more control of the drill, especially if stalled conditions occur.
- 2.8 Grasp the drill firmly by insulated surfaces.
- 2.9 Always hold or brace the tool securely. Brace against stationary objects for maximum control. If drilling in a clockwise -- forward -- direction, brace the drill to prevent a counter-clockwise reaction.
- 2.10 Don't force a drill. Apply enough pressure to keep the drill bit cutting smoothly. If the drill slows down, relieve the pressure. Forcing the drill can cause the motor to overheat, damage the bit and reduce operator control.

3.0 Potential Hazards

- 3.1 Electrical shock
- 3.2 Leaving chuck wrench in tool
- 3.3 Puncture wounds
- 3.4 Flying debris
- 3.5 Severe cuts
- 3.6 Fire
- 3.7 Burns (hot bits)
- 3.8 Sprains/strains (wrist)

4.0 Training Requirements

- 4.1 Review of Applicable SOPs.
- 4.2 Demonstrated knowledge on the use of a power drill.
- 4.3 Review and follow manufacturers operating guidelines.

5.0 Personal Protective Equipment (Level D PPE)

5.1 Leather Gloves

6.0 Other Safety Tips

6.1 Electric drills must be double-insulated or plugged into a GFCI outlet.

6.2 Never carry tool by cord or yank it to disconnect from receptacle.

6.3 Keep cord away from sharp edges.

S3NA-305-WI9 Pressure Washer Safety Card

1.0 Objective / Overview

- 1.1 High pressure washers can operate up to pressures of 5,000 psi and come in a variety of types ranging from gas operated to electrical. If not used correctly and safely, pressure washers can be dangerous piece of work equipment.
- 1.2 AECOM only allows trained, authorized personnel to operate the high pressure washers. Along with training, other safety measures include: reviewing the manufacturers instructional booklet, proper maintenance of equipment, and personal protective equipment.

2.0 Safe Operating Guidelines

- 2.1 The gun valve must always be pointed at the work area, NEVER point the gun valve at yourself or another person.
- 2.2 High pressure washers shall be used to clean or decontaminate equipment, surfaces or structures only.
- 2.3 High pressure washers WILL NOT be used to clean or decontaminate workers or personal protective equipment while it is being worn.
- 2.4 Always set the tripper safety lock when the gun valve is not in use.

3.0 Training Requirements

- 3.1 Review of Applicable SOPs
- 3.2 Demonstrated knowledge on the use of a pressure washer
- 3.3 Review of manufacturers operating guidelines

4.0 Potential Hazards

- 4.1 Kickback – Sudden and violent reverse movement of the gun
- 4.2 Flying debris
- 4.3 Slips and trips on wet surfaces and hoses
- 4.4 Exhaust fumes/carbon monoxide (CO) in enclosed spaces
- 4.5 Severe cuts

5.0 Personal Protective Equipment (Level D PPE)

- 5.1 Hard hat with faceshield
- 5.2 Heavy gloves
- 5.3 Hearing protection
- 5.4 PVC (or equivalent) rain suit

6.0 Other Safety Tips

- 6.1 Never fill a pressure washer fuel tank with fuel while the engine is running or if the engine is still hot.
- 6.2 Non-operators must remain a minimum of 25 feet from the operator.
- 6.3 High pressure washing equipment should be cleaned often to avoid dirt buildup, especially around the trigger and guard area.

- 6.4 Always set the trigger safety lock when the gun valve is not in use.
- 6.5 Relieve the pressure in the system before coupling and uncoupling hoses.
- 6.6 Visually inspect the full length of high pressure discharge hose and inspect other high pressure fluid-handling components for abrasions or cuts, damage caused by exposure to chemicals and for damage caused by kinks in the hose.

S3NA-305-WI10 Reciprocating Saw Safety Card

1.0 Objective / Overview

- 1.1 The versatility of the reciprocating saw, in cutting metal, pipe, wood and other materials have made it a widely used tool.
- 1.2 By design, it is a simple tool to handle. Its demands for safe use, however, are very important.

2.0 Safe Operating Guidelines

- 2.1 Use sharp blades. Dull blades can produce excessive heat, make sawing difficult, result in forcing the tool, and possibly cause an accident.
- 2.2 Position yourself to maintain full control of the tool, and avoid cutting above shoulder height.
- 2.3 To minimize blade flexing and provide a smooth cut, use the shortest blade that will do the job.
- 2.4 The work piece must be clamped securely, and the shoe of the saw held firmly against the work to prevent operator injury and blade breakage.
- 2.5 Maintain firm contact between the saw's shoe and the material being cut.
- 2.6 When making a "blind" cut (you can't see behind what is being cut), be sure that hidden electrical wiring, or water pipes are not in the path of the cut.
- 2.7 If wires are present, they must be disconnected at their power source by a qualified person or avoided, to prevent the possibility of lethal shock or fire.
- 2.8 Water pipes must be drained and capped.
- 2.9 Always hold the tool by the insulated grouping surfaces. When making anything other than a through cut, allow the tool to come to a complete stop before removing the blade from the work piece. This prevents breakage of the blade, and possible loss of tool control.
- 2.10 Different work surfaces demand different blades.

3.0 Potential Hazards

- 3.1 Flying debris
- 3.2 Hearing loss
- 3.3 Cuts
- 3.4 Hand / arm vibration syndrome

4.0 Training Requirements

- 4.1 Review of Applicable SOPs
- 4.2 Demonstrated knowledge on the use of a reciprocating saw
- 4.3 Review and follow manufacturers operating guidelines

5.0 Personal Protective Equipment (Level D PPE)

- 5.1 Leather Gloves/anti-vibration gloves
- 5.2 Hearing protection

The correct way to hold the reciprocating saw while operating.

6.0 Other Safety Tips

- 6.1 Do not operate reciprocating saw in explosive atmospheres.
- 6.2 Do not overreach. Keep proper footing and balance at all times.
- 6.3 Do not use tool if switch is not operating correctly.
- 6.4 Check for misalignment or binding of moving parts, breakage or parts and any other condition that may affect the tool's operation.
- 6.5 Always use two hands to operate saw (see picture).

S3NA-305-WI11 Sander Safety Card

1.0 Objective / Overview

- 1.1 Sanders are commonly used at project sites for a variety of tasks.
- 1.2 Often times the hazards associated with sanders are overlooked; they don't appear threatening because they don't have sharp blades or bits. These misconceptions can be prevented through proper training and PPE selection.

2.0 Safe Operating Guidelines

- 2.1 Make sure the sander is switched "OFF" before connecting the power supply. Disconnect power supply before changing a sanding belt, making adjustments, or emptying dust collector. Inspect sanding belts before using them.
- 2.2 Replace those belts that are worn or frayed. Install sanding belts that are the same widths as the pulley drum.
- 2.3 Adjust sanding belt tension to keep the belt running true and at the same speed as pulley drum.
- 2.4 Secure the sanding belt in the direction shown on the belt and the machine. Keep hands away from the sanding belt.
- 2.5 Use two hands to operate sanders – one on the trigger and the other on the front handle knob.
- 2.6 Clean dust from the motor and vents on a regular basis.
- 2.7 Do not use a sander without an exhaust system or dust collector present that is in good working order.
- 2.8 Empty the collector when $\frac{1}{4}$ full.
- 2.9 Do not exert excessive pressure on a moving sander. The weight of the sander provides adequate pressure for the job.
- 2.10 Do not work on unsecured stock unless it is heavy enough to stay in place.
- 2.11 Do not overreach. Always keep proper footing and balance.
- 2.12 Do not cover air vents of the sander.
- 2.13 Check often to ensure that guards are in their normal position.
- 2.14 Before starting a sander, be sure the power cord and extension cords are out of the belt path and are long enough to freely complete the task. The sander must be either double insulated or connected to a GFCI.

3.0 Potential Hazards

- 3.1 Kickback – Sudden and violent reverse of the sander
- 3.2 Hearing loss
- 3.3 Flying debris
- 3.4 Severe abrasive cuts
- 3.5 Electrocutation
- 3.6 Explosion/fire hazard from the dust

4.0 Training Requirements

- 4.1 Review of Applicable SOPs.
- 4.2 Review and follow manufacturers operating guidelines.

5.0 Personal Protective Equipment (Level D PPE)

- 5.1 Hearing protection
- 5.2 Leather gloves

S3NA-305-WI12 Utility Knife Safety Card

1.0 Objective / Overview

- 1.1 Utility knives serve a variety of purposes at worksites, and can be a useful tool, when used safely and correctly.
- 1.2 Learning proper positioning and correctly using a utility knife will drastically reduce the potential of cut related injuries.

2.0 Safe Operating Guidelines

- 2.1 Always be sure that knives are sharp and not dull. A dull blade will require more force to cut, increasing the likelihood of slipping.
- 2.2 Be sure to blade is seated in the frame of the knife correctly, closed, and fastened together properly.
- 2.3 Always keep body parts away from the cut line, (e.g., fingers), and ensure that the material being cut is on firm ground and not against a body part (e.g. cutting rope against your leg).
- 2.4 Always pull the knife, never push the knife (the blade may break, and momentum could cause the body to come into contact with broken blade).
- 2.5 Always retract the blade when not in use.

3.0 Potential Hazards

- 3.1 Lacerations from direct contact with the blade
- 3.2 Lacerations from blade breaking or shattering
- 3.3 Ergonomics

4.0 Training Requirements

- 4.1 Review of Applicable SOPs.
- 4.2 Review of client specific requirements.
- 4.3 Demonstrated knowledge on the safe use of a utility knives.
- 4.4 Review and follow manufacturers operating guidelines for specialized or unusual knives.

5.0 Personal Protective Equipment (Level D PPE)

- 5.1 Cut resistant gloves (Kevlar, thick leather, etc.).

6.0 Other Safety Tips

- 6.1 Purchase safety equipped utility knives with guarding or automatically retracting blades.
- 6.2 Replace dull blades – When knife begins to tear rather than cut, it is a good indicator the blade is dull.
- 6.3 Always wear a cut resistant glove on your free hand.
- 6.4 Always use the right tool for the job – NEVER use the blade as a screwdriver or prying tool.
- 6.5 When using a knife to cut thicker materials, use several passes. Increased force on the blade can cause it to stray from the intended cut path, or break the blade.
- 6.6 When changing blades, always handle from the non-sharp side. Cover blade with duct tape and dispose.
- 6.7 Use an alternate tool when possible (scissors, wire cutters, etc.).

S3NA-305-WI13 Wood Chipper Safety Card

1.0 Objective / Overview

- 1.1 Wood chippers should be used with extreme caution in order to prevent personal injury, as the wood chipper is open to receive tree branches and other wooden material.
- 1.2 AECOM only allows trained, authorized personnel to operate the wood chipper.
- 1.3 Along with training, other safety measures include: reviewing the manufacturers instructional booklet, proper maintenance of equipment, and personal protective equipment.

2.0 Safe Operating Guidelines

- 2.1 The operator must be completely familiar with the controls and proper use of the equipment.
- 2.2 Workers feeding material into self-feeding wood chippers are at risk of being fed through the chipper if they reach or fall into the infeed hopper or become entangled in braches feeding into the machine.
- 2.3 Prior to use, make sure all safety devices and controls, such as emergency shut-off devices, are tested and verified to be functioning properly.
- 2.4 Make sure two workers (buddy system) are in close contact with each other when operating the chipper.

3.0 Potential Hazards

- 3.1 Burns from contact with the hot muffler or engine
- 3.2 Flying debris
- 3.3 Noise exposure
- 3.4 Inhaling exhaust fumes
- 3.5 Entanglement in limbs and contact with chipper blades

4.0 Training Requirements

- 4.1 Review of Applicable SOPs.
- 4.2 Demonstrated knowledge on the use of a wood chipper.
- 4.3 Review of manufacturers operating guidelines.

5.0 Personal Protective Equipment (Level D PPE)

- 5.1 Leather gloves
- 5.2 Hearing protection
- 5.3 Debris shield
- 5.4 Long sleeve shirt (e.g. working near poison ivy, poison oak, etc.)

6.0 Other Safety Tips

- 6.1 Stand to the side of the chipper while inserting limbs into chipper, never stand directly in front.
- 6.2 Insert trunk portion of tree/limb first. This will prevent the branches from getting entangled with clothing, etc. and pulling you in with the tree/limb.

- 6.3 Bystanders should be kept at least 25 feet away when in operation.
- 6.4 Keep the area around the wood chipper free of tripping hazards.
- 6.5 Never wear loose clothing that may get caught on feed material or moving parts.
- 6.6 Always set the trigger safety lock when the gun valve is not in use.
- 6.7 Never fill the fuel tank while the engine is running or if the engine is still hot.

S3NA-305-WI14 Clearing and Grubbing Equipment Safety Card

In accordance with 29 CFR 1910.266, the following safety precautions will be followed during site clearing and tree felling:

1.0 Hand Tools

- 1.1 All hand tools shall be in safe condition. Tools shall be inspected by the user daily.
- 1.2 Handles shall be sound, straight and tight-fitting.
- 1.3 Driven tools shall be dressed to remove any mushrooming.
- 1.4 Cutting tools shall be kept sharp and properly shaped.
- 1.5 All clearing activities shall terminate during electrical storms and periods of high winds.
- 1.6 Dead, broken or rotted limbs or trees (widow makers) shall be felled first.
- 1.7 Always wear the appropriate Personal Protective Equipment (PPE) when using hand tools, particularly eye and hand protection.
- 1.8 Use the right tool that is being used for the job to reduce chance of unexpected occurrences. Do not submit or use makeshift tools.
- 1.9 Defective tools shall not be used. They shall be taken out of service until repaired or replaced.
- 1.10 Check tools for damage or wear prior to each use to reduce chance of unexpected occurrences.
- 1.11 Replace cracked or broken handles on files, hammers, screwdrivers, or sledges.
- 1.12 Replace worn jaws on wrenches, pipe tools, and pliers
- 1.13 Redress burred or mushroomed heads on striking tools.
- 1.14 Sharpen cutting tools frequently to reduce chance of unexpected occurrences.
- 1.15 Store hand tools properly after each use.
- 1.16 Tools shall be clean and dry to avoid slippage when in use.
- 1.17 Never leave tools on ladders, scaffolds, or overhead work areas when they are not in use (a high number of injuries occur from objects/tools falling from overhead work areas in construction).
- 1.18 Always keep tools being used in overhead work areas in containers that will prevent them from falling.
- 1.19 Carry tools using a heavy belt or apron and hang tools at your sides.
- 1.20 Never carry tools in your pockets or hanging behind your back.
- 1.21 Avoid muscle strain and fatigue by doing the following:
 - Avoid using hand tools with your wrist bent.
 - Choose tools that allow you to keep your wrist straight when using them.
 - Always PULL on wrenches and pliers. Never push unless you hold the tool with your palm open.
 - Always cut away from yourself when using cutting tools.
- 1.22 Establish balance and stable footing when using a bar for prying. Pry bars can slip or break without warning.
- 1.23 Be aware of the presence of other personnel when using any tool, especially picks or axes.

2.0 Machete Use

- 2.1 A machete will only be used for its designated purpose; do not carelessly swing the machete when it is not needed.
- 2.2 To prevent lacerations, employees will wear Kevlar gloves and Kevlar chain saw chaps.

- 2.3 Machetes shall not be used when other employees are in the immediate work area.

3.0 Use of Weed Whips

- 3.1 Weed whips may be used to clear vegetation such as grass, light brush, briars and tree seedlings. The L-shaped weed whip cuts grass and weeds but is unstable for use on larger growth; the triangular-frame weed whip cuts briars and woody stems up to a half-inch in diameter. A "Suwannee" sling is a heavy duty weed whip that also has an axe blade. It does the same work as a weed whip, but can also cut through large materials. The heavier weight of this tool allows it to more easily cut off larger material than a weed whip.
- 3.2 When using weed whips, employees should follow these safety procedures:
- 3.2.1 Select the correct tool for the types and size of vegetation present across the landfill.
- 3.2.2 Employees will wear leather gloves when using weed whips.
- 3.2.3 Weed whips are meant to be swung back and forth with both hands. Avoid using a golf swing. The tool should be swung no higher than an employee's side.
- 3.2.4 Strong swings should be made to prevent the blade from bouncing or glancing off springy growth.
- 3.2.5 Screws hold the serrated double-edge blade in place. These screws can work loose so check them before each use.
- 3.2.6 At the end of the day, inspect the whips for damage. Clean, sharpen, and oil as necessary and store with a sheath in place.

4.0 Chain Saws

- 4.1 Hand Protection (leather gloves)
- 4.2 Eye Protection
- 4.3 Hearing Protection
- 4.4 Long sleeves and pants; no loose clothing
- 4.5 Chaps (full protection) or pants with full front protection as well as all around protection below the knee
- 4.6 As per manufacturer's instructions
- 4.7 The chainsaw shall:
- 4.7.1 Be in safe operating condition;
- 4.7.2 Have a chain that minimizes the possibility of a kickback; and
- 4.7.3 Have a device which will effectively stop the chain in the event of a kickback or when the engine is at idle.
- 4.8 Operate the chainsaw in accordance with manufacturer's instructions.
- 4.9 Hold the chainsaw firmly with two hands during operation.
- 4.10 Hold the chainsaw firmly when starting.
- 4.11 Have the chain stopped when not actually cutting.
- 4.12 Be sure that the chain brake is functioning properly and adequately stops the chain.
- 4.13 Check that the chain is sharp, has the correct tension and is adequately lubricated.
- 4.14 Start, hold, carry or store and use of the saw as directed by the manufacturer.
- 4.15 Do not use the chain saw for cutting above shoulder height.
- 4.16 Add fuel in a well-ventilated area and not while the saw is running or hot.
- 4.17 Use an approved safety container to contain the fuel used along with a proper spout or funnel for pouring.

- 4.18 Carry and transport the chain saw with the bar guard in place, the chain bar toward the back and the motor shut off.
- 4.19 Chain saws shall be inspected daily to assure that all handles and guards are in place and tight, that all controls function properly and that the muffler is operative.
- 4.20 Start the saw only on the ground or when otherwise firmly supported.
- 4.21 Clear brush which might interfere with clear footing before starting to cut.
- 4.22 Shut off the saw when carrying it for a distance greater than from tree to tree or when surface is slippery or heavy with underbrush. The saw shall be at idle speed when carried short distances.
- 4.23 Do not use the saw to cut directly overhead or a distance at which the operator no longer has a safe grip on the saw. Always use two hands to operate the saw.
- 4.24 Safety glasses with permanently attached side shields will be worn underneath a steel mesh face shield which will attach to standard hard hats. The brush shield is designed to protect the head and face from debris created by using a chain saw. Employees will wear Kevlar gloves and Kevlar chain saw chaps. Appropriate ear protection shall also be worn.

5.0 Felling Trees Manually

- 5.1 Before cutting begins, survey the work area for dead limbs, the lean of the tree to be cut, wind conditions and the location of other trees.
- 5.2 Remove lodged trees (tree has not fallen to the ground after being separated from its stump) as soon as possible. Never work under a lodged tree.
- 5.3 The distance between workers should be maintained at twice the height of the trees being felled.

6.0 Chipping Operations

- 6.1 Access covers and doors shall not be opened until the drum or disk is at a complete stop.
- 6.2 Infeed and discharge ports shall be designed to prevent employee contact with disc, knives and blower blades.

7.0 Cutting Tools

- 7.1 Wear safety glasses and protective gloves when using cutters.
- 7.2 Choose the proper cutter for the job. Cutters are designed for a specific type, hardness, and size of material.
- 7.3 Inspect the tool for proper working condition.
- 7.4 If tool is designed to have a guard, make sure guards are in place.
- 7.5 Cut materials straight across - keep the material being cut at right angles to the cutting edges of jaws.
- 7.6 Warn those in the area to take precautionary measures to avoid possible injury from flying metal pieces.
- 7.7 Keep cutting tools in good repair.
- 7.8 Adjust and lubricate cutter and moving parts daily if heavily used.
- 7.9 Sharpen jaws according to manufacturer's instructions.
- 7.10 Do not use a cutting tool until you are trained in its proper and safe use.
- 7.11 Do not use cushion grip handles for jobs requiring electrically-insulated handles. Cushion grips are for comfort primarily and do not protect against electric shock.
- 7.12 Do not use cutters which are cracked, broken or loose.
- 7.13 Do not exceed the recommended capacity of a tool.
- 7.14 Do not cut diagonally.
- 7.15 Do not rock cutters from side to side when cutting wire.

- 7.16 Do not pry or twist with tool when cutting.
- 7.17 Do not hammer on cutting tools or extend the handle length to achieve greater cutting power.
- 7.18 Do not expose cutters to excessive heat.

8.0 Selection and Use

- 8.1 Select tools that can be used without bending the wrist. Hand tools should allow the operator to grasp, hold, and use the tool with the wrist held straight.
- 8.2 Select the tool with the workplace layout and job design in mind. Sometimes a tool is correct for one operation and incorrect for another.
- 8.3 Use the right tool for the job. Confirm it is the right size and has sufficient power to do the job safely. When there is a choice, select a tool of a low weight.
- 8.4 Select low-vibrating tools, or choose tools with vibration-absorbing handles, like those covered with cork, rubber, plastic or plastic bonded to steel, to reduce hand-arm vibration.
- 8.5 Choose hand tools that have the center of gravity within or close to the handle.
- 8.6 Select tools with rounded and smooth handles that you can grip easily.
- 8.7 If they are available, choose hand tools with double handles to permit easier holding and better manipulation of the tool.
- 8.8 Select tools with a trigger strip, rather than a trigger button. This strip will allow you to exert more force over a greater area of the hand that, in turn, will reduce muscle fatigue.
- 8.9 Confirm that the trigger works easily to reduce the effort needed to operate it.
- 8.10 Confirm that your tool is well maintained and in good repair.
- 8.11 Frequently used tools that weigh more than 1 pound should be counter-balanced.
- 8.12 Hold the tool close to the body. Do not overreach.
- 8.13 Keep good balance and proper footing at all times. This will help operators to control the tool better, especially in response to unexpected situations.
- 8.14 Rest your hands by putting the tool down when you are not using it.
- 8.15 Reduce power to the lowest setting that can complete the job safely. This action reduces tool vibration at the source.
- 8.16 Confirm that cutting tools, drill bits, etc., are kept sharp, clean, and well maintained.
- 8.17 Do not wear gloves, loose clothing or jewelry while using revolving power tools. Tie back long hair or wear appropriate hair protection to prevent hair from getting caught in moving parts of equipment (manufacturer's operating manual for recommended PPE and/or safety issues/concerns).
- 8.18 Do not use a tool unless you have been trained to use it safely and know its limitations and hazards.

9.0 Storage and Handling

- 9.1 All tools shall be stored in a manner to prevent damage and injury. Store tools in a dry, secure location when they are not being used.
- 9.2 Tools shall be properly put away after each use.
- 9.3 Sharp or pointed tools shall be handled only if the sharp/pointed edge is covered, carried in a tool box or other device designed for that purpose, or the sharp/pointed edge is pointed downward, away from the body.

S3NA-305-WI15 Pneumatic Tools Safety Card

1.0 General Requirements

- 1.1 Wear safety glasses.
- 1.2 Ensure that the compressed air supplied to the tool is clean and dry. Dust, moisture, and corrosive fumes can damage a tool. An in-line regulator filter and lubricator increases tool life.
- 1.3 Keep tools clean and lubricated, and maintain them according to the manufacturers' instructions.
- 1.4 Use only the attachments that the manufacturer recommends for the tools you are using.
- 1.5 Be careful to prevent hands, feet, or body from injury in case the machine slips or the tool breaks.
- 1.6 Reduce physical fatigue by supporting heavy tools with a counter-balance wherever possible.
- 1.7 Use the proper hose and fittings of the correct diameter.
- 1.8 Use hoses specifically designed to resist abrasion, cutting, crushing and failure from continuous flexing.
- 1.9 Choose air-supply hoses that have a minimum working pressure rating of 150 psig or 150% of the maximum pressure produced in the system, whichever is higher.
- 1.10 Check hoses regularly for cuts, bulges and abrasions. Tag and replace, if defective.
- 1.11 Blow out the air line before connecting a tool. Hold hose firmly and blow away from yourself and others.
- 1.12 Make sure that hose connections fit properly and are equipped with a mechanical means of securing the connection (e.g., chain, wire, or positive locking device).
- 1.13 Install quick disconnects of a pressure-release type rather than a disengagement type. Attach the male end of the connector to the tool, NOT the hose.
- 1.14 Do not operate the tool at a pressure above the manufacturer's rating.
- 1.15 Turn off the air pressure to the hose when not in use or when changing power tools.
- 1.16 Do not carry a pneumatic tool by its hose.
- 1.17 Avoid creating trip hazards caused by hoses laid across walkways or curled underfoot.
- 1.18 Do not use compressed air to blow debris or to clean dirt from clothes.

2.0 Pneumatic Nailing and Stapling Tools

- 2.1 Permit only experienced and trained persons to operate pneumatic nailing and stapling tools.
- 2.2 Wear safety glasses or face a shield and, where necessary, use hearing protection.
- 2.3 Inspect a tool before connecting it to air supply:
 - 2.3.1 Check tool safety mechanisms if applicable.
 - 2.3.2 Tighten securely all screws and cylinder caps.
- 2.4 Check correct air supply and pressure before connecting a tool.
- 2.5 Check that the tool is correctly and securely connected to the air supply hose and that it is in good working order, with the safety mechanism operative, before using.
- 2.6 Always handle a tool as if it loaded with fasteners (nails, staples, etc.).
- 2.7 Equip tools with a work-contacting element that limits the contact area to one that is as small as practical.
- 2.8 Make sure that the mechanical linkage between the work-contacting element and trigger is enclosed.

- 2.9 Disconnect a tool from the air supply when the tool is unattended and during cleaning or adjustment. Before clearing a blockage, be sure that depressing the trigger exhausts all air from the tool.
- 2.10 Use only fasteners recommended by the manufacturer.
- 2.11 Permit only properly trained people to carry out tool maintenance.
- 2.12 Do not depress the trigger unless the nosepiece of tool is directed onto a safe work surface.
- 2.13 Do not carry a tool with the trigger depressed.
- 2.14 Do not load a tool with fasteners while the trigger is depressed.
- 2.15 Do not overreach. Keep proper footing and balance.

S3NA-305-WI16 Manual Hand Tools Safety Card

1.0 Hammers

- 1.1 Hammers are designed according to the intended purpose. Select a hammer that is comfortable for you and that is the proper size and weight for the job. Misuse can cause the striking face to chip, possibly causing a serious injury.
- 1.2 Choose a hammer with a striking face diameter approximately ½ inch larger than the face of the tool being struck (e.g., chisels, punches, wedges, etc.).
- 1.3 Ensure that the head of the hammer is firmly attached to the handle.
- 1.4 Replace loose, cracked or splintered handles.
- 1.5 Discard any hammer with mushroomed or chipped face or with cracks in the claw or eye sections.
- 1.6 Strike a hammer blow squarely with the striking face parallel to the surface being struck. Always avoid glancing blows and over and under strikes. (Hammers with beveled faces are less likely to chip or spall).
- 1.7 Look behind and above you before swinging the hammer.
- 1.8 Watch the object you are hitting.
- 1.9 Hold the hammer with your wrist straight and your hand firmly wrapped around the handle.
- 1.10 Do not use a hammer with a loose or damaged handle.
- 1.11 Do not use handles that are rough, cracked, broken, splintered, sharp-edged or loosely attached to the head.
- 1.12 Do not use any hammer head with dents, cracks, chips, mushrooming, or excessive wear.
- 1.13 Do not use a hammer for any purpose for which it was not designed or intended.
- 1.14 Do not use one hammer to strike another hammer, other hard metal objects, stones or concrete.
- 1.15 Do not redress, grind, weld or reheat-treat a hammer head.
- 1.16 Do not strike with the side or cheek of the hammer.
- 1.17 Inspect pipe wrenches periodically for worn or unsafe parts and replace them (e.g., check for worn threads on the adjustment ring and movable jaw).
- 1.18 Keep pipe wrench teeth clean and sharp.
- 1.19 Face a pipe wrench forward. Turn wrench so pressure is against heel jaw.
- 1.20 Pull, rather than push on the pipe wrench handle. Maintain a proper stance with feet firmly placed to hold your balance.
- 1.21 Do not use a pipe wrench as a hammer, or strike a pipe wrench with a hammer.
- 1.22 Do not use pipe wrenches on nuts and bolts.
- 1.23 Do not use a pipe extender for extra leverage. Get a larger pipe wrench.
- 1.24 Replace pipe cutter wheels which are nicked or otherwise damaged.
- 1.25 Use a 3- or 4-wheeled cutter, if there is not enough space to swing the single wheel pipe cutter completely around the pipe.
- 1.26 Choose a cutting wheel suitable for cutting the type of pipe material required:
 - 1.26.1 Thin wheel for cutting ordinary steel pipe.
 - 1.26.2 Stout wheel for cutting cast iron.
 - 1.26.3 Other wheels for cutting stainless steel, plastic and other materials.

- 1.27 Select the proper hole diameter and correct tap size to tap a hole. The hole should be sized so that the thread cut by the tap will be about 75% as deep as the thread on the tap.
- 1.28 Use a proper tap wrench (with a "T" handle) for turning a tap.
- 1.29 Use lubricant or machine cutting fluid with metals other than cast iron.
- 1.30 Do not permit chips to clog flutes (grooves in the tap that allow metal chips to escape from the hole). The chips may prevent the tap from turning – this may result in the tap breaking if you continue to apply pressure.
- 1.31 Do not use a conventional adjustable wrench for turning a tap – it will cause uneven pressure on the tap that may cause it to break.
- 1.32 Do not attempt to thread hardened steel. This can chip or damage the die.
- 1.33 Do not thread any rod or other cylindrical object that is larger in diameter than the major diameter of the die thread.
- 1.34 Do not use a spiral reamer on a rotating pipe. The reamer may snag and cause serious injury.

2.0 Pliers and Wire Cutters

- 2.1 Pliers are made in various shapes and sizes and for many uses. Use the correct pliers or wire cutters for the job.
- 2.2 Choose pliers or wire cutters that have a grip span of 2½ – 3½ inches to prevent your palm or fingers from being pinched when the tools are closed.
- 2.3 Use adjustable pliers that allow you to grip the work piece firmly while maintaining a comfortable handgrip (i.e., hand grasp is not too wide).
- 2.4 Use tools only if they are in good condition.
- 2.5 Make sure that the cutting edges are sharp. Dull and worn-down cutting edges require many times more force for cutting.
- 2.6 Make sure that the toothed jaws are clean and sharp. Greasy or worn-down jaws can result in compromised safety. Such tools also require increased force to hold the work piece which, in turn, increases the risk of muscular fatigue and repetitive strain injuries.
- 2.7 Oil pliers and wire cutters regularly. A drop of oil on the hinge will make the tools easier to use.
- 2.8 Pull on the pliers; do not push away from you when applying pressure. If the tool slips unexpectedly, you may lose your balance or injure your hand.
- 2.9 Cut at right angles. Never rock the cutting tool from side to side or bend wire back and forth against the cutting edges.
- 2.10 Do not cut hardened wire unless the pliers or wire cutters are specifically manufactured for this purpose.
- 2.11 Do not expose pliers or wire cutters to excessive heat.
- 2.12 Do not bend stiff wire with light pliers. Needle-nose pliers can be damaged by using the tips to bend large wire. Use a sturdier tool.
- 2.13 Do not use pliers as a hammer.
- 2.14 Do not hammer on pliers or wire cutters to cut wires or bolts.
- 2.15 Do not extend the length of handles to gain greater leverage. Use a larger pair of pliers for gripping or a bolt cutter for cutting.
- 2.16 Do not use cushion grip handles for jobs requiring tools with electrically-insulated handles. Cushion grips are for comfort primarily and do not protect against electric shock.
- 2.17 Do not use pliers on nuts and bolts; use a wrench.

3.0 Screwdrivers

- 3.1 Screwdrivers are made in various shapes and sizes and for many uses. Use the correct screwdriver for the job.
- 3.2 Choose contoured handles that fit the shank tightly, with a flange to keep the hand from slipping off the tool.
- 3.3 Use a slot screwdriver with a blade tip width that is the same as the width of the slotted screw head.
- 3.4 For cross-head screws, use the correct size and type of screwdriver; a Phillips screwdriver may slip out of a screw head designed for use with the slightly flatter-tipped Pozi-driv screwdriver.
- 3.5 Use a vise or clamp to hold the stock if the piece is small or moves easily.
- 3.6 Keep the screwdriver handle clean. A greasy handle could cause an injury or damage from unexpected slippage.
- 3.7 If work must be carried out on "live" electrical equipment, use screwdrivers that have insulated handles designed for electrical work and a non-conducting shaft. Remember, most plastic handles are designed for grip and comfort.
- 3.8 Use non-magnetic tools when working near strong magnets (e.g., in some laboratories).
- 3.9 Use a screw-holding screwdriver (with screw-holding clips or magnetic blades) to get screws started in awkward, hard-to-reach areas. Square-tipped screwdrivers (e.g., Robertson) that hold screws with recessed square holes are also useful in such situations.
- 3.10 Use an offset screwdriver in close quarters where a conventional screwdriver cannot be used.
- 3.11 Use a screwdriver that incorporates the following features when continuous work is needed:
 - 3.11.1 A pistol grip to provide for a straighter wrist and better leverage.
 - 3.11.2 A "Yankee drill" mechanism (spiral ratchet screwdriver or push screwdriver) which rotates the blade when the tool is pushed forward.
 - 3.11.3 A ratchet device to drive hard-to-move screws efficiently, or use a powered screwdriver.
- 3.12 File a rounded tip square making sure the edges are straight. A dull or rounded tip can slip out of the slot and cause hand injury or damage to materials.
- 3.13 Store screwdrivers in a rack or partitioned pouch so that the proper screwdriver can be selected quickly.
- 3.14 Do not lean or push on a screwdriver with any more force than necessary to keep contact with the screw. A screw properly piloted and fitted will draw itself into the right position when turned. Keep the shank directly over the screw being driven.
- 3.15 Do not hold the stock in one hand while using the screwdriver with the other. If the screwdriver slips out of the slot you may cut your hand.
- 3.16 Do not hammer screws that cannot be turned.
- 3.17 Do not grind the tip to fit another size screw head.
- 3.18 Do not try to use screwdrivers on screw heads for which they are not designed (e.g., straight blade screwdrivers on Phillips, clutch head, Torx or multi-fluted spline screw heads).
- 3.19 Do not use defective screwdrivers (e.g., ones with rounded or damaged edges or tips; split or broken handles; or bent shafts).
- 3.20 Do not use a screwdriver for prying, punching, chiseling, scoring, scraping or stirring paint.
- 3.21 Do not use pliers on the handle of a screwdriver for extra turning power. A wrench should be used only on the square screwdriver shank designed for that purpose.
- 3.22 Do not expose a screwdriver blade to excessive heat. Heat can affect the temper of the metal and weaken the tool.
- 3.23 Do not use a screwdriver to check if an electrical circuit is live. Use a suitable meter or other circuit testing device.
- 3.24 Do not carry screwdrivers in your pockets.

4.0 Snips

- 4.1 Wear safety glasses and protective gloves when working with snips. Small pieces of metal may go flying in the air and cut edges of metal are sharp.
- 4.2 Snips are made in various shapes and sizes for various tasks. The handle can be like those on scissors with finger and thumb holes or like plier handles. Models are available for cutting in straight lines and in curves to the left or right.
- 4.3 Universal snips can cut in both straight and wide curves.
- 4.4 Straight snips and duckbill snips (flat blade, "perpendicular" to the handle, with pointed tips) are generally designed to cut in straight lines; some duckbill snips are designed for cutting curved lines.
- 4.5 Hawk's bill snips (with crescent-shaped jaws) are used for cutting tight circles.
- 4.6 Aviation snips have compound leverage that reduces the effort required for cutting.
- 4.7 Offset snips have jaws that are set at an angle from the handle.
- 4.8 Select the right size and type of snips for the job; check the manufacturer's specifications about the intended use of the snips (e.g., type of cut - straight, wide curve, tight curve, right or left, and maximum thickness and kind of metal or other material that can be cut).
- 4.9 Use only snips that are sharp and in good condition.
- 4.10 Use snips for cutting soft metal only. Hard or hardened metal should be cut with tools designed for that purpose.
- 4.11 Use ordinary hand pressure for cutting. If extra force is needed, use a larger tool.
- 4.12 Cut so that the waste is on the right if you are right-handed or on the left if you are left-handed.
- 4.13 Avoid springing the blades. This results from trying to cut metal that is too thick or heavy for the snips you are using.
- 4.14 Keep the nut and the pivot bolt properly adjusted at all times.
- 4.15 Oil the pivot bolt on the snips occasionally.
- 4.16 Do not try to cut sharp curves with straight cut snips.
- 4.17 Do not cut sheet metal thicker than the manufacturer's recommended upper limit (e.g., cuts up to 16-gauge cold, rolled steel or 18-gauge stainless steel). Do not extend the length of handles to gain greater leverage.
- 4.18 Do not hammer or use your foot to exert extra pressure on the cutting edges.
- 4.19 Do not use cushion grip handles for tasks requiring insulated handles. They are for comfort primarily and not for protection against electric shocks.
- 4.20 Do not attempt to re-sharpen snips in a sharpening device designed for scissors, garden tools, or cutlery.

5.0 Wood Chisels

- 5.1 Wear safety glasses.
- 5.2 Wood chisels are made in various shapes and sizes and for many uses. Use the correct chisel for the job.
- 5.3 Use the right size of chisel for the job.
- 5.4 Choose smooth, rectangular handles that have no sharp edges and are attached firmly to the chisel.
- 5.5 Ensure that the cutting edge is sharp. Dull chisels can be difficult to control and require more effort to do the job.
- 5.6 Check stock thoroughly for knots, staples, nails, screws, or other foreign objects before chiseling.
- 5.7 Clamp stock so it cannot move.

- 5.8 Adjust your stance so that you do not lose your balance if the tool slips.
- 5.9 Chip or cut away from yourself.
- 5.10 Keep your hands and body behind the cutting edge.
- 5.11 Use a wooden or plastic mallet with a large striking face on all chisels. Only heavy-duty or framing chisels are made of a solid or molded handle that can be struck with a steel hammer.
- 5.12 Make finishing or paring cuts with hand pressure alone.
- 5.13 Place chisels safely within the plastic protective caps to cover cutting edges when not in use.
- 5.14 Replace any chisel that is bent or shows dents, cracks, chips, or excessive wear.
- 5.15 Store chisels in a "storage roll," a cloth or plastic bag with slots for each chisel, and keep them in a drawer or tray.
- 5.16 Replace broken or splintered handles.
- 5.17 Sharpen cutting edges as often as necessary.
- 5.18 Do not use a wood chisel as a pry or a wedge.
- 5.19 Do not use a wood chisel on metal.
- 5.20 Do not use an all-steel chisel with a mushroomed face or a chipped edge. Redress with a file or whetstone.
- 5.21 Do not use a grinder to redress heat-treated tools. Use a whetstone.
- 5.22 Do not use a dull chisel.

6.0 Wrenches

- 6.1 Use the correct wrench for the job - pipe wrenches for pipes and plumbing fittings, and general-use wrenches for nuts and bolts.
- 6.2 Discard any damaged wrenches (e.g., open-ended wrenches with spread jaws or box wrenches with broken or damaged points).
- 6.3 Select the correct jaw size to avoid slippage.
- 6.4 Position your body in a way that will prevent you from losing balance and hurting yourself if the wrench slips or something (e.g., a bolt) suddenly breaks.
- 6.5 Use a box or socket wrench with a straight handle, rather than an off-set handle, when possible.
- 6.6 Ensure that the jaw of an open-ended wrench is in full contact (fully seated, "flat," not tilted) with the nut or bolt before applying pressure.
- 6.7 Face an adjustable wrench "forward," adjust tightly and turn the wrench so pressure is against the permanent or fixed jaw.
- 6.8 Ensure that the teeth of a pipe wrench are sharp and free of oil and debris and that the pipe or fitting is clean to prevent unexpected slippage and possible injuries.
- 6.9 Apply a small amount of pressure to a ratchet wrench initially to ensure that the ratchet wheel (or gear) is engaged with the pawl (a catch fitting in the gear) for the direction you are applying pressure.
- 6.10 Support the head of the ratchet wrench when socket extensions are used.
- 6.11 Pull on a wrench using a slow, steady pull; do not use fast, jerky movements.
- 6.12 Stand aside when work is done with wrenches overhead.
- 6.13 Make sure adjustable wrenches do not "slide" open during use.
- 6.14 Keep tools well maintained (cleaned and oiled).
- 6.15 Clean and place tools and wrenches in a tool box, rack or tool belt after use.
- 6.16 Do not push on a wrench - losing your balance is more likely if the wrench slips.
- 6.17 Do not use a wrench that is bent or damaged.

- 6.18 Do not use worn adjustable wrenches. Inspect the knurl, jaw and pin for wear.
- 6.19 Do not pull on an adjustable wrench that is loosely adjusted.
- 6.20 Do not use pipe wrenches on nuts or bolts.
- 6.21 Do not use pipe wrenches for lifting or bending pipes.
- 6.22 Do not use a wrench on moving machinery.
- 6.23 Do not use the wrong tools for the job. For example, never use pliers instead of a wrench or a wrench as a hammer.
- 6.24 Do not use a makeshift wrench.
- 6.25 Do not insert a shim in a wrench for better fit.
- 6.26 Do not strike a wrench (except a "strike face" wrench) with a hammer or similar object to gain more force.
- 6.27 Do not increase the leverage by adding sleeved additions (e.g., a pipe) to increase tool handle length.
- 6.28 Do not expose a wrench to excessive heat (like from a blow torch) that could affect the temper of the metal and ruin the tool.

7.0 Files/Rasps

- 7.1 Personnel will not use a file as a pry bar, hammer, screwdriver, or chisel.
- 7.2 When using a file or a rasp, grasp the handle in one hand and the toe of the file in the other.
- 7.3 Personnel will not hammer on a file.

8.0 Chisels

- 8.1 Personnel will not use a chisel that has a dull cutting edge.
- 8.2 Personnel will not use chisels that have "mushroomed" striking heads.
- 8.3 Hold a chisel by using a tool holder if possible.
- 8.4 Clamp small work pieces in the vise and chip towards the stationary jaw when working with a chisel.

9.0 Vises

- 9.1 When clamping a long work piece in a vise, support the far end of the work piece by using an adjustable pipe stand, saw horse or box.
- 9.2 Position the work piece in the vise so that the entire face of the jaw supports the work piece.
- 9.3 Personnel will not use a vise that has worn or broken jaw inserts, or has cracks or fractures in the body of the vise.
- 9.4 Personnel will not slip a pipe over the handle of a vise to gain extra leverage.

10.0 Clamps

- 10.1 Personnel will not use the C-clamp for hoisting materials.
- 10.2 Personnel will not use the C-clamp as a permanent fastening device.

11.0 Jacks

- 11.1 Personnel will not exceed the jack's rated lifting capacity as noted on the label of the jack.
- 11.2 Clear all tools, equipment and any other obstructions from under the vehicle before lowering the jack.

S3NA-305-WI17 Small Engine Safety Card

1.0 Objective / Overview

- 1.1 Operate small-engine machines, such as push mowers, weed trimmers, and leaf blowers, in a safe manner.
- 1.2 You should know how to operate and maintain them in a safe manner.
- 1.3 If possible, read the operator's manual. It will contain detailed information on the safe operation and maintenance of the machine. If you do not have a manual, ask if one can be ordered from the manufacturer.

2.0 Safe Operating Guidelines

- 2.1 Do not wear loose or baggy clothing around tools with rotating parts.
- 2.2 Never run the engine indoors, in poorly ventilated areas, or in a location where the exhaust could be drawn into a building through an opening.
- 2.3 Never store engine with fuel in fuel tank inside a building with potential sources of ignition such as hot water and space heaters, clothes dryers, electric motors, etc.
- 2.4 Never remove fuel cap or add fuel when engine is running.
- 2.5 Never start or operate the engine with the fuel fill cap removed.
- 2.6 Refuelling: allow engine to cool; fill in well-ventilated area; and do not smoke while re-fuelling.
- 2.7 Use only properly labelled, CSA approved red gasoline containers to store and dispense fuel.
- 2.8 Do not pour fuel from engine or siphon fuel by mouth.
- 2.9 Never leave the engine unattended while it is running.
- 2.10 Never operate the engine with an unguarded engine shaft.
- 2.11 Do not modify the engine or tamper with the factory setting of the engine governor.
- 2.12 Never operate the engine without a muffler guard in place and avoid touching hot areas of the engine.
- 2.13 Keep all flammable materials away from the muffler and the rest of the engine; do not idle or park the engine in dry grass or ground cover.
- 2.14 When working on the equipment, avoid accidental starts by removing the ignition key, turn off all engine switches, disconnect the battery and disconnect the spark plug, keeping it away from metal part.
- 2.15 Always wear hearing protection when operating an engine.

3.0 Training Requirements

- 3.1 Review of Applicable SOPs.
- 3.2 Demonstrated knowledge on the use of small engine equipment.
- 3.3 Review and follow manufacturers operating guidelines.

4.0 Personal Protective Equipment (Level D PPE)

- 4.1 Always wear safety goggles with shields
- 4.2 Leather or cotton gloves
- 4.3 Long pants and long sleeve shirt
- 4.4 Safety toe work boots

4.5 Hearing protection (earmuffs or earplugs)

5.0 Potential Hazards

5.1 Flying debris

5.2 Hearing loss

5.3 Cuts

5.4 Burns

S3NA-305-WI18 Electric and Battery Hand Tools Safety Card

All electrical tools and equipment must be operated in accordance with the requirements of *S3NA-302-PR Electrical, General*.

1.0 Safe Work Practices

- 1.1 Maintain all electrical tools and cords in good condition and not overloaded.
- 1.2 Do not wear loose or baggy clothing around tools with rotating parts.
- 1.3 The switch on the tool must be in the OFF position before connecting it to a power source.
- 1.4 Verify that the power source is the same voltage and current as indicated on the nameplate of the tool. Using a higher voltage can cause serious injury to the operator as well as burn out the tool.
- 1.5 The tool must have an approved three-wire cord with a three-prong plug so that it can be used only in a properly grounded three-hole receptacle, unless the tool is double insulated to protect the operator from electrical shock.
- 1.6 All outdoor receptacles must be protected by means of a ground fault circuit interrupter* (GFCI or GFI) available in portable or fixed models. Do not use any electric power tools outdoors in a receptacle that is not properly protected.
- 1.7 Report all shocks and/or sparks from electrical tools, no matter how minor. The tool in question should be tagged out and not be used until it has been checked for ground fault.
- 1.8 Maintain electrical cords and appliances in good working order.
 - 1.8.1 Cords and appliances must be CSA approved.
 - 1.8.2 Never carry an electric tool by the cord or disconnect the plug by pulling or jerking on the cord (can damage, loosen, or separate connections).
 - 1.8.3 Check cords frequently for such damage such as kinks, cuts, and cracked or broken outer jackets (any cord that feels more than comfortably warm to the touch should be checked by an electrician for overloading).
- 1.9 Store electrical cords in a clean, dry area off the ground to prevent damage to cord.
- 1.10 Equipment must have proper guards or shields and they must remain in place. If, due to damage or deterioration, the original guard provided on a piece of equipment cannot be put in place, the tool must be removed from service.
- 1.11 Do not modify, remove, or disable any machine guards.
- 1.12 Stand to one side when engaging or disengaging an electrical circuit breaker to avoid electrical flash backs.
- 1.13 It's strongly advisable to use GFCI with all portable electric tools at any time.
- 1.14 A cord should not be pulled or dragged over nails, hooks, or other sharp objects that may cause cuts in the insulation. In addition, cords should never be placed on radiators, steam pipes, walls, and windows. Particular attention should be placed on connections behind furniture, since files and bookcases may be pushed tightly against electrical outlets, severely bending the cord at the plug.
- 1.15 Disconnect electrical equipment before cleaning, adjusting, or applying flammable solutions. If a guard is removed to clean or repair parts, replace it before testing the equipment and returning the machine to service.
- 1.16 Only authorized persons are permitted to activate, de-activate or lockout electrical equipment.
- 1.17 Where there is or may be a danger to a worker, from the inadvertent operation of electrical equipment, then that equipment must be locked out and tagged prior to commencing work.

- 1.17.1 Switch off all appropriate devices (MCC, Distribution Panel, Disconnect).
- 1.17.2 Lock and tag Electrical Supply devices in the "OFF" position.
- 1.17.3 Test to be sure the equipment cannot be operated at the STOP-START switch.
- 1.17.4 Test to be sure electrical equipment is de-energized.
- 1.17.5 After completion of task, remove padlocks and destroy tags.

2.0 Inspection

- 2.1 Inspect tools for any damage prior to each use.
- 2.2 Ensure that the power tool has the correct guard, shield or other attachment that the manufacturer recommends.
- 2.3 Ensure that the tools are properly grounded using a 3-prong plug, are double-insulated (and are labeled as such), or are powered by a low-voltage isolation transformer; this will protect users from an electrical shock.
- 2.4 Check electric tools to ensure that a tool with a 3-prong plug has an approved 3-wire cord and is grounded. The 3-prong plug should be plugged in a properly grounded 3-pole outlet. If an adapter must be used to accommodate a 2-hole receptacle, the adapter wire must be attached to a known, functioning ground. Never remove the third, grounding prong from a plug.
- 2.5 Check the handle and body casing of the tool for cracks or other damage.
- 2.6 If the tool has auxiliary or double handles, check to see that they installed securely.
- 2.7 Inspect cords for defects: check the power cord for cracking, fraying, and other signs of wear or faults in the cord insulation.
- 2.8 Any tool with a spring-operated trigger switch shall be fully functional.
- 2.9 Check for damaged switches and ones with faulty trigger locks.
- 2.10 Inspect the plug for cracks and for missing, loose or faulty prongs.
- 2.11 If a tool is defective, remove it from service, and tag it clearly "Out of service for repair." Replace damaged equipment immediately – do not use defective tools "temporarily." DO NOT ATTEMPT FIELD REPAIRS.

3.0 Battery Powered Tools

- 3.1 Use only the kind of battery that the tool manufacturer specifies for the battery-powered tool that you are using.
- 3.2 Recharge a battery-powered tool only with a charger that is specifically intended for the battery in that tool.
- 3.3 Remove the battery from the tool or ensure that the tool is switched off or locked off before changing accessories, making adjustments, or storing the tool.
- 3.4 Store a battery pack safely so that no metal parts, nails, screws, wrenches and so on can come in contact with the battery terminals; this could result in shorting out the battery and possibly cause sparks, fires or burns.

4.0 Using Electric Tools

- 4.1 Switch off the tools before connecting them to a power supply.
- 4.2 If a power cord feels more than comfortably warm or if a tool is sparking excessively, have it checked by an electrician or other qualified person.
- 4.3 Disconnect the power supply before making adjustments or changing accessories.
- 4.4 Remove any wrenches and adjusting tools before turning on a tool.

- 4.5 Inspect the cord for fraying or damage before each use. Tag defective tools clearly with an "Out of Service" tag and replace immediately with a tool in good running order.
- 4.6 During use, keep power cords clear of tools and the path that the tool will take.
- 4.7 Use clamps, a vice or other devices to hold and support the piece being worked on, when practical to do so. This will allow you to use both hands for better control of the tool and will help prevent injuries if a tool jams or binds in a work piece.
- 4.8 Use only approved extension cords that have the proper wire size for the length of cord and power requirements of the electric tool that you are using. This will prevent the cord from overheating.
- 4.9 For outdoor work, use outdoor extension cords marked "W-A" or "W."
- 4.10 Suspend power cords over aisles or work areas to eliminate stumbling or tripping hazards.
- 4.11 Eliminate octopus connections: if more than one receptacle plug is needed, use a power bar or power distribution strip that has an integral power cord and a built-in overcurrent protection.
- 4.12 Pull the plug not the cord when unplugging a tool. Pulling the cord causes wear and may adversely affect the wiring to the plug - an electrical shock to the operator may result.
- 4.13 Keep power cords away from heat, water, oil, sharp edges and moving parts. They can damage the insulation and cause a shock.
- 4.14 Avoid accidental starting by ensuring the tool is turned off before you plug it in. Also do not walk around with a plugged-in tool with your finger touching the switch.
- 4.15 Do not bypass the ON/OFF switch and operate the tools by connecting and disconnecting the power cord.
- 4.16 Do not disconnect the power supply of the tool by pulling or jerking the cord from the outlet.
- 4.17 Do not leave a running tool unattended. Do not leave it until it has been turned off, has stopped running completely, and has been unplugged.
- 4.18 Do not use electric tools in wet conditions or damp locations unless tool is connected to a ground fault circuit interrupter (GFCI).
- 4.19 Do not expose electric power tools to rain or wet conditions; wet tools increase the likelihood of getting an electric shock.
- 4.20 Avoid body contact with grounded surfaces like refrigerators, pipes and radiators when using electric powered tools; this will reduce the likelihood of shock if the operator's body is grounded.
- 4.21 Do not plug several power cords into one outlet by using single-to-multiple outlet adapters or converters ("cube taps").
- 4.22 Do not use light duty power cords.
- 4.23 Do not connect or splice extension cords together to make a longer connection: the resulting extension cord may not be able to provide sufficient current or power safely.
- 4.24 Do not carry electrical tools by the power cord.
- 4.25 Do not tie power cords in knots. Knots can cause short circuits and shocks. Loop the cords or use a twist lock plug.
- 4.26 Never break off the third prong on a plug: replace broken 3-prong plugs and make sure the third prong is properly grounded.
- 4.27 Never use extension cords as permanent wiring; use extension cords only as a temporary power supply to an area that does not have a power outlet.
- 4.28 Do not walk on or allow vehicles or other moving equipment to pass over unprotected power cords. Cords should be put in conduits or protected by placing planks on each side of them.
- 4.29 Do not brush away sawdust, shavings or turnings while the tool is running. Never use compressed air for cleaning surfaces or removing sawdust, metal turnings, etc.
- 4.30 Do not operate tools in an area containing explosive vapors or gases.
- 4.31 Do not clean tools with flammable or toxic solvents.

- 4.32 Do not surprise or touch anyone who is operating a tool. Startling a tool operator could end up causing an accident or injury.

5.0 Belt Sanders

- 5.1 Wear safety glasses.
- 5.2 Make sure the sander is switched "OFF" before connecting the power supply.
- 5.3 Disconnect power supply before changing a sanding belt, making adjustments, or emptying dust collector.
- 5.4 Inspect sanding belts before using them. Replace those belts that are worn or frayed.
- 5.5 Install sanding belts that are the same widths as the pulley drum.
- 5.6 Adjust sanding belt tension to keep the belt running true and at the same speed as pulley drum.
- 5.7 Secure the sanding belt in the direction shown on the belt and the machine.
- 5.8 Keep hands away from a sanding belt.
- 5.9 Use two hands to operate sanders – one on a trigger switch and the other on a front handle knob.
- 5.10 Keep all cords clear of sanding area during use.
- 5.11 Clean dust from a motor and vents at regular intervals.
- 5.12 Do not use a sander without an exhaust system or a dust collector present that is in good working order. Empty the collector when 1/4 full. The dust created when sanding can be a fire and explosion hazard. Proper ventilation is essential.
- 5.13 Do not exert excessive pressure on a moving sander. The weight of the sander supplies adequate pressure for the job.
- 5.14 Do not work on unsecured stock unless it is heavy enough to stay in place. Clamp the stock into place or use a "stop block" to prevent movement.
- 5.15 Do not overreach. Always keep proper footing and balance.
- 5.16 Do not cover the air vents of the sander.

6.0 Drills

- 6.1 Wear safety glasses.
- 6.2 Keep drill air vents clear to maintain adequate ventilation.
- 6.3 Always keep drill bits sharp.
- 6.4 Keep all cords clear of the cutting area during use. Inspect for frays or damage before each use.
- 6.5 Disconnect power supply before changing or adjusting bit or attachments.
- 6.6 Tighten the chuck securely. Remove chuck key before starting drill.
- 6.7 Secure workpiece being drilled to prevent movement.
- 6.8 Slow the rate of feed just before breaking through the surface.
- 6.9 Drill a small "pilot" hole before drilling large holes.
- 6.10 For small pieces, clamp stock so work will not twist or spin. Do not drill with one hand while holding the material with the other.
- 6.11 Do not use a bent drill bit.
- 6.12 Do not exceed the manufacturer's recommended maximum drilling capacities.
- 6.13 Do not use a hole saw cutter without the pilot drill.
- 6.14 Do not use high speed steel (HSS) bits without cooling or using lubrication.
- 6.15 Do not attempt to free a jammed bit by starting and stopping the drill. Unplug the drill and then remove the bit from the work piece.

- 6.16 Do not reach under or around stock being drilled.
- 6.17 Do not overreach. Always keep proper footing and balance.
- 6.18 Do not raise or lower the drill by its power cord.

7.0 Planers

- 7.1 Wear safety glasses.
- 7.2 Disconnect the planer from the power supply before making any adjustments to the cutter head or blades.
- 7.3 Use blades of the same weight and set at the same height.
- 7.4 Ensure that the blade-locking screws are tight.
- 7.5 Remove adjusting keys and wrenches before turning on power.
- 7.6 Support the material (stock) in a comfortable position that will allow the job to be done safely and accurately.
- 7.7 Check stock thoroughly for staples, nails, screws, or other foreign objects before using a planer.
- 7.8 Start a cut with the infeed table (front shoe) resting firmly on the stock and with the cutter head slightly behind the edge of the stock.
- 7.9 Use two hands to operate a planer - one hand on the trigger switch and the other on a front handle.
- 7.10 Do not put your finger or any object in a deflector to clean out chips while a planer is running.
- 7.11 Disconnect the power supply when stopping to dump out chips.
- 7.12 Do not set a planer down until blades have stopped turning.
- 7.13 Keep all cords clear of cutting area.

8.0 Routers

- 8.1 Wear safety glasses.
- 8.2 Disconnect the power supply before making any adjustments or changing bits.
- 8.3 Ensure that the bit is securely mounted in the chuck and the base is tight.
- 8.4 Put the base of the router on the work, template or guide. Make sure that the bit can rotate freely before switching on the motor.
- 8.5 Secure stock. Never rely on yourself or a second person to support or hold the material. Sudden torque or kickback from the router can cause damage and injury.
- 8.6 Before using a router, check stock thoroughly for staples, nails, screws or other foreign objects.
- 8.7 Keep all cords clear of cutting area.
- 8.8 Always hold both hands on router handles, until a motor has stopped. Do not set the router down until the exposed router bit has stopped turning.
- 8.9 Do not overreach. Keep proper footing and balance.
- 8.10 When inside routing, start the motor with the bit above the stock. When the router reaches full power, lower the bit to two times the required depth.
- 8.11 When routing outside edges, guide the router counter clockwise around the work.
- 8.12 When routing bevels, moldings and other edge work, make sure the router bit is in contact with the stock to the left of a starting point and is pointed in the correct cutting direction.
- 8.13 Feed the router bit into the material at a firm, controlled speed.
- 8.14 With softwood, you can sometimes move the router as fast as it can go. With hardwood, knotty and twisted wood, or with larger bits, cutting may be very slow.

- 8.15 The sound of the motor can indicate safe cutting speeds. When the router is fed into the material too slowly, the motor makes a high-pitched whine. When the router is pushed too hard, the motor makes a low growling noise.
- 8.16 When the type of wood or size of the bit requires going slow, make two or more passes to prevent the router from burning out or kicking back.
- 8.17 To decide the depth of cut and how many passes to make, test the router on scrap lumber similar to the work.

9.0 Circular Saws

- 9.1 Wear safety glasses and hearing protection.
- 9.2 Check the retracting lower blade guard to make certain it works freely.
- 9.3 Ensure that the blade that you have selected is sharp enough to do the job. Sharp blades work better and are safer.
- 9.4 Check the saw for proper blade rotation.
- 9.5 Set the depth of the blade, while the saw is unplugged, and lock it at a depth so that the lowest tooth does not extend more than about 1/8 inch beneath the wood.
- 9.6 Keep all cords clear of cutting area.
- 9.7 Circular saws are designed for right-hand operation; left-handed operation will demand more care to operate safely.
- 9.8 Check the retracting lower blade guard frequently to make certain it works freely. It should enclose the teeth as completely as possible, and cover the unused portion of the blade when cutting.
- 9.9 Check that the retracting lower blade guard has returned to its starting position before laying down the saw.
- 9.10 Keep upper and retracting lower blade guard clean and free of sawdust.
- 9.11 Disconnect power supply before adjusting or changing the blade.
- 9.12 Allow the saw to reach full power before starting to cut.
- 9.13 Use two hands to operate saws - one on a trigger switch and the other on a front knob handle.
- 9.14 Keep the motor free from accumulation of dust and chips.
- 9.15 Select the correct blade for stock being cut and allow it to cut steadily. Do not force it.
- 9.16 Secure work being cut to avoid movement.
- 9.17 Do not hold or force the retracting lower guard in the open position.
- 9.18 Do not place your hand under the shoe or guard of the saw.
- 9.19 Do not over tighten the blade-locking nut.
- 9.20 Do not twist the saw to change, cut or check alignment.
- 9.21 Do not use a saw that vibrates or appears unsafe in any way.
- 9.22 Do not force the saw during cutting.
- 9.23 Do not cut materials without first checking for obstructions or other objects such as nails and screws.
- 9.24 Do not carry the saw with a finger on the trigger switch.
- 9.25 Do not overreach. Keep proper footing and balance.
- 9.26 Do not rip stock without using a wedge or guide clamped or nailed to the stock.

10.0 Other Saws

- 10.1 Wear safety glasses.
- 10.2 Disconnect power supply before changing or adjusting blades.

- 10.3 Use lubricants when cutting metals.
- 10.4 Keep all cords clear of cutting area.
- 10.5 Position the saw beside the material before cutting and avoid entering the cut with a moving blade.
- 10.6 Make sure guards, if present, are installed and are working properly.
- 10.7 Remember sabre saws cut on the upstroke.
- 10.8 Secure and support stock as close as possible to the cutting line to avoid vibration.
- 10.9 Keeps the base or shoe of the saw in firm contact with the stock being cut.
- 10.10 Select the correct blade for the material being cut and allow it to cut steadily. Do not force it. Clean and sharp blades operate best.
- 10.11 Set the blade to go no further than 1/8 to 1/4 inch deeper than the material being cut.
- 10.12 Do not start cutting until the saw reaches its full power.
- 10.13 Do not force a saw along or around a curve. Allow the machine to turn with ease.
- 10.14 Do not insert a blade into or withdraw a blade from a cut or lead hole while the blade is moving.
- 10.15 Do not put down a saw until the motor has stopped.
- 10.16 Do not reach under or around the stock being cut.
- 10.17 Maintain control of the saw always. Avoid cutting above shoulder height.
- 10.18 **External Cuts**
- 10.18.1 Make sure that the blade is not in contact with the material or the saw will stall when the motor starts.
- 10.18.2 Hold the saw firmly down against the material and switch the saw on.
- 10.18.3 Feed the blade slowly into the stock, maintaining an even forward pressure.
- 10.19 **Internal Cuts**
- 10.19.1 Drill a lead hole slightly larger than the saw blade. With the saw switched off, insert the blade in the hole until the shoe rests firmly on the stock.
- 10.19.2 Do not let the blade touch the stock until the saw has been switched on.

S3NA-306-PR Highway and Road Work

1.0 Purpose and Scope

- 1.1 To address potential hazards that may occur during highway construction and during work within the right of way of a public or private roadway.
- 1.2 This procedure applies to all AECOM North America-based employees and operations.

2.0 Terms and Definitions

- 2.1 **Personal Protective Equipment (PPE):** Safety clothing and equipment worn by workers in traffic areas to provide protection and heightened visibility from physical hazards including moving vehicles and construction equipment.
- 2.2 **Traffic areas:** Any work area where workers are located within 20 feet of moving traffic, existing or anticipated.
- 2.3 **Traffic Control Plan:** A written document containing drawings and text that describes the physical controls to be established to isolate workers from moving vehicles.
- 2.4 **WOF:** Workers on foot.

3.0 Attachments

- 3.1 S3NA-306-FM Equipment Checklist

4.0 Procedure

4.1 Roles and Responsibilities

- 4.1.1 **Project/Lead Manager or Resident Engineer** is responsible for administering the procedure and for determining the measures and configuration of the temporary traffic control zone in accordance with specifications for workers, motorists, and pedestrians and the protection of AECOM employees within the contract. The Lead Manager will also see that employees assigned to work in traffic areas are trained in the use of traffic control systems and PPE.
- 4.1.2 **Site Safety Coordinator** is responsible to the lead manager for the implementation of safety and the internal traffic control plan within a highway construction/demolition worksite. The Site Safety Coordinator will
 - Be responsible for traffic safety coordination on office projects.
 - Be appointed by each office that has any field work involving AECOM staff working in or near traffic. This is not a dedicated role and may be a committee member.
 - Receive training in the requirements of the governing transportation authority and the applicable OH&S legislation through training sanctioned by the respective authorities.
 - Be involved in conducting hazard assessments, developing the mitigating strategies and Safe Job Procedures, and reviewing their implementation for any project where traffic is identified as a hazard to our team members.

4.2 Personal Protective Equipment

- 4.2.1 High visibility safety vest /apparel
- 4.2.2 Retro-reflective stripes (for night work)
- 4.2.3 Protective headwear (hard hat)
- 4.2.4 Two-way radio or other means of effective communication
- 4.2.5 Traffic Accommodation equipment, as required by the traffic protection plan:

- A rooftop beacon light for the vehicle, where required
- Pylons, Glo-posts, flags, barricades and/or flagging tape, warning lights, flashing light boards
- Signage
- Flagging equipment, as required:
 - Daytime:
 - Flag person's "Stop and Slow" paddle
 - A blaze orange flag person's vest over white coveralls
 - Safety head protection (hard hat)
 - Drinking water
 - Bug repellent and/or sun screen as conditions warrant
 - Optional radio communication (if required)
 - Night time (additional requirements):
 - A retro-reflective "Stop and Slow" paddle
 - A flashlight fitted with a red signaling baton
 - Flashing yellow beacons set up in advance of the flag person

4.3 **Restrictions**

- 4.3.1 Applicable legislated requirements governing all aspects of traffic safety, including directing traffic, signage, PPE, traffic control devices in temporary construction, maintenance and utility work zones, will be reviewed in preparation for the site-specific traffic accommodation.
- 4.3.2 No personnel will be allowed onto the site without first reviewing the project-specific traffic protection plan.

4.4 **Training**

- 4.4.1 All staff will receive on-site orientation to the hazards and controls.
- 4.4.2 Only staff with appropriate flag person training will act as a flag person.

4.5 **Traffic Control Plan**

- 4.5.1 Transportation incidents and workers struck by vehicles or mobile equipment account for many fatal construction work injuries. Workers in highway construction activities including flagging, demolition, surveying, utility, clean-up, emergency responders, and others in areas where traffic exists are exposed to being struck by moving vehicles. Work zones are used to move traffic in an approved direction and are typically identified by signs, cones, barrels, and barriers.
- 4.5.2 The procedures appropriate for work in traffic areas will vary depending on the work environment. Very simple procedures are needed in an inactive parking lot, and more complex procedures are needed when working in a construction zone on a highway. Each AECOM project team shall prepare a project HASP or SWP addressing traffic controls and worker protection appropriate for the team's project and exposures. Plans shall address the following if applicable:
- Attenuator vehicles
 - Closures within a closure
 - Communications
 - Driving: seatbelts and rollover protection should be used on equipment and vehicles as stated by the manufacturer
 - Night operations and work within traffic controls
 - PPE
 - Sanitation

- Traffic control plans and permits
 - Training
 - Work zone protections: various styles of concrete, water, sand, collapsible barriers, crash cushions, and truck mounted attenuators are available to limit motorist intrusions into the construction work zone
 - Worker: heavy equipment interface
- 4.5.3 A Traffic Control Plan will be completed for the movement of vehicles in areas where workers are conducting other tasks.
- 4.5.4 Drivers, workers on foot (WOF), and pedestrians will be able to see and understand the routes they are to follow.
- 4.5.5 Where there are several projects, coordinated vehicle routes and communication between contractors will reduce vehicular struck-by incidents.
- 4.5.6 Hazard identification and plan development shall be performed in accordance with this procedure. The plans shall include the identification of the responsibility for personnel and implementation of the safety program under highway construction activities.
- 4.5.7 Other requirements for supporting activities such as excavations, heavy equipment usage, personal protective equipment, etc. shall be applicable and addressed in accordance with other Standard Operating Procedures.
- A traffic protection plan will be an integral part of the Health and Safety Plan (HASP) or Safe Work Plan (SWP) whenever staff will be exposed to the hazards of vehicular traffic during project work (this may include surveys, drilling and soils inspections, bridge or overpass inspections, inspection of roadway construction projects).
 - Work duration, road width, and traffic volume are some of the key considerations to be contemplated when designing a traffic protection plan. The traffic protection plan will address the specific vehicular hazards and describe the measures that will be implemented to protect employees.
 - Traffic accommodation plans will be developed in consultation with a qualified supervisor or manager experienced in traffic control. In addition, a supervisor will be designated to oversee the implementation of the protection plan until work is completed.
 - OH&S regulations and associated standards or guidebooks provide instruction on the use of traffic control devices in temporary construction, maintenance, and utility work zones for worker and motorist safety and to minimize the disruption of traffic flow.
 - Schedule work to avoid periods of heavy traffic.
 - Alert traffic of work ahead, by placing signs or cones well ahead of the work area.
 - If the work area is being managed under a Traffic Control Plan or Traffic Accommodation Plan, obtain copies of these plans before commencing work.
 - Traffic accommodation that is adequate in good weather conditions and daylight may not be adequate under adverse weather conditions and/or hours of darkness. Reassess the accommodation based on conditions.
 - Traffic accommodation will be planned to provide safe conditions for the protection and safe passage of motorists, pedestrians, and employees at all work sites. It will include all areas located within the traveled portion of a roadway including shoulders, ditches, and boulevards.
- 4.6 **Short-Term Traffic Protection**
- 4.6.1 Always wear the appropriate PPE to maintain your visibility to vehicular traffic. Wear a tear-away fluorescent reflective vest (and retro-reflective stripes on the arms and legs for night work or during periods of limited visibility) at all times.
- 4.6.2 Pull your vehicles off as far to the right of the traveled portion of the road as possible. Confirm that the shoulder of the highway or street where you will park your vehicle is wide enough to allow for safe access to and egress from the vehicle.
- 4.6.3 Always park your vehicle at least 30 metres from the flag person station. The vehicle should be positioned between the flag person and the work crew.

- 4.6.4 Activate the four-way flashers for your vehicle prior to exiting the vehicle.
- 4.6.5 Plan an escape route prior to exiting the vehicle.
- 4.6.6 Load and unload materials or equipment from the passenger side of the vehicle.
- 4.6.7 Avoid turning your back to oncoming traffic.
- 4.6.8 Be aware of mobile equipment that may be operating in the work area.
- 4.6.9 Do not enter onto the traveled portion of the road except to cross the road. Road crossings should be made at a 90 degree angle to the direction of the road.

4.7 **Long-Term Traffic Protection**

- 4.7.1 Traffic accommodation will be provided BEFORE the work starts and will be maintained until the work is completed. This may mean 24 hours a day, 7 days a week.
- 4.7.2 Generally, for long-term duration work activities that are performed at construction projects, the Constructor for the project is required to develop a traffic protection plan.
- 4.7.3 If AECOM has assumed the role of Constructor for the project, the traffic protection plan will be developed and implemented prior to the commencement of work activities at the project.
- 4.7.4 If AECOM is not the Constructor for the project, the traffic protection plan for the project will be developed by our Client or a Constructor designated by the Client.
- 4.7.5 The traffic protection plan should be reviewed with AECOM employees during orientation to the Project. If the traffic protection plan is not discussed at the project-specific orientation, employees should discuss the issue with the Site Supervisor or Client contact for the Project.

4.8 **Signage**

- 4.8.1 Standard highway signs for information, speed limits, and work zones will assist drivers in identifying designated traffic paths.
- 4.8.2 Provide appropriate instructional signage such as: EVACUATION ROUTE; DO NOT ENTER; REDUCED SPEED AHEAD; ROAD CLOSED; and NO OUTLET.
- 4.8.3 Using standard highway signs for internal construction worksite traffic control will assist workers in recognizing the route they are to use at the construction site.
- 4.8.4 Traffic Signs
 - Signage will be of acceptable standards, in good condition, clean, legible, and suited to the purpose.
 - Signage will be secured or weighted.
 - Routinely inspect signage for placement, cleanliness, and physical damage.
 - Cover road traffic control signage when no activity is present.

4.9 **Traffic Control Devices**

- 4.9.1 Standard traffic control devices, signals, and message boards will instruct drivers to follow a path away from where work is being done.
- 4.9.2 The authority in charge will determine the approved traffic control devices such as cones, barrels, barricades, and delineator posts that will be used as part of the traffic control plan.
- 4.9.3 These standard devices should also be used inside the work zone.

4.10 **Work Zone Protections**

- 4.10.1 Various styles of concrete, water, sand, collapsible barriers, crash cushions, and truck-mounted attenuators shall be used to limit motorist intrusions into the construction work zone, as appropriate.
- 4.10.2 All AECOM staff shall be made aware of controls established by the Contractor.
- 4.10.3 AECOM staff shall wear the required safety equipment at all times including a hard hat, work boots, eye protection, and a high-visibility safety vest as a minimum and shall observe all project rules and requirements.

4.10.4 In the absence of a contractor, when AECOM staff are in the field alone—e.g., investigations, surveys—all appropriate DOT traffic control standards and devices shall be observed and placed in position.

4.10.5 The work zone shall be made safe by its separation from traffic.

4.11 **Flagging**

4.11.1 Flaggers and others providing temporary traffic control will wear high visibility clothing with a background of fluorescent yellow-green or orange-red and white, silver, yellow-green, orange, or yellow retro-reflective material.

4.11.2 In areas of traffic movement, PPE will make the worker visible for at least 1,000 feet so that the worker can be seen from any direction and will make the worker stand out from the background. Check the label or packaging to confirm that the garments are performance Class 2 or 3 (class requirement may be project-specific).

4.11.3 Drivers should be warned in advance with signs that there will be a flagger ahead.

4.11.4 Flaggers should use STOP/SLOW paddles, paddles with lights, or flags (flags should be used only in emergencies.). The STOP sign should be octagonal with a red background and white letters and border. The SLOW sign should be octagonal with an orange background and black letters and a border.

4.11.5 **Flag Persons**

- A traffic control person (flag person) will stand in a safe position, preferably on the driver's side of the lane under control, be clearly visible, have an unobstructed view of approaching traffic, and be positioned at least 25 m (80 ft) away from the work area unless circumstances or space requirements, such as working at or near an intersection, dictate otherwise.
- Flag persons will be trained and competent and will use appropriate PPE.
- Flag persons will be instructed in traffic control and flagging procedures, will be provided with sufficient breaks, and will not be permitted to work alone for extended periods as per local regulations.
- Flag persons will not get involved in needless conversation and will stay alert at their points of duty until relieved.
- Except for brief flagging operations, or in an emergency, "Flag Person Ahead" signs will be posted in advance of each flag person's station. Such signs will be removed promptly when the flagging operation terminates.

4.12 **Lighting**

4.12.1 Flagger stations should be illuminated. Lighting for workers on foot and equipment operators is to be at least 5 foot-candles or greater.

4.12.2 Where available lighting is not sufficient, flares or chemical lighting should be used.

4.12.3 Glare affecting workers and motorists should be controlled or eliminated.

4.13 **Training**

4.13.1 Flaggers should be trained/certified and will use the signaling methods required by the authority in charge.

4.13.2 WOF, equipment operators, and drivers in internal work zones need to know the routes that construction vehicles will use.

4.13.3 Equipment operators and signal persons need to know the hand signals used on the worksite.

4.13.4 Operators and WOF need to know the visibility limits and the "blind spots" for each vehicle on site.

4.13.5 WOF should wear high visibility safety garments designated as Class 1, 2 or 3.

4.13.6 Workers should be made aware of the ways in which shift work and night work may affect their performance.

4.14 Driving

- 4.14.1 Seatbelts and rollover protection will be used on equipment and vehicles as stated by the manufacturer.
- 4.14.2 When pulling off to the side of the road, AECOM personnel will park their vehicles at minimum of 20 feet or the width of two traffic lanes from moving traffic.

4.15 Night Operations and Work Within Traffic Controls

- 4.15.1 Night work on roadways should not be done unless absolutely necessary and unless the work area is adequately lit.
- 4.15.2 Operations with night activities will have a written plan that addresses the safety issues of working at night. The plan will address, but is not limited to:
- Reflectivity
 - All equipment used in the work zone shall have DOT-approved reflective material placed to increase the visibility of the equipment.
 - All reflective surfaces shall be cleaned as required so that the reflectivity of the material is not degraded. Any areas of reflective surface that is damaged or obscured will be replaced.
 - Personnel working at night will have reflective tape on their hardhats and will wear retro-reflective vests at a minimum. The reflective bands on vests will be vertical and horizontal around the entire upper body.
 - Additional measures such as white disposable coveralls, reflective bands, and personal battery-operated strobe lights may be used when practical.
 - Illumination
 - Whenever feasible and practical, light plants will be used to illuminate the work area.
 - On mobile operations, additional lighting on equipment may be used to illuminate the work area.
 - All equipment shall, at a minimum, have working strobe or warning beacon lights.
 - All equipment shall have working lights confirmed through daily visuals.
 - All flag persons will be placed in illuminated areas only.
 - All lighting is to be checked after setup to confirm that it is not blinding approaching traffic or other equipment in the work zone.
 - Hazard Analysis and Communication
 - Prior to the start of any night operation, a detailed Hazard Analysis will be made addressing the possible hazards of night work. The Hazard Analysis will be reviewed with the crews and updated as needed. At the start of each shift, the Daily Safety Reminder will be used to reaffirm the provisions of the night work requirements as found in the hazard analysis and this policy.
 - The hazard analysis should also provide for:
 - The selection of a competent person responsible for maintaining surveillance on the work area to alert other workers of vehicles encroaching on the work zone.
 - A method to signal workers when vehicles encroach on the work zone.
 - A system to account for workers at all times, which may include a buddy system.
 - Emergency communication or warning signals used by a worker such as a radio, signal horn, or whistle, which will be used to call for help.

4.16 Attenuator Vehicles

- 4.16.1 Although not required, it is good construction practice to place an attenuator truck or pick-up truck (minimum) immediately ahead of workers in a work zone.
- 4.16.2 The vehicle of choice should be placed to provide the best protection for workers.
- 4.16.3 The tires should be placed so that when struck the vehicle will turn away from workers.

4.17 Closures within a Closure

4.17.1 On occasion, satellite operations may be performed under full freeway traffic closures. For this type of work, special precautions referred to as a "closure within a closure" is to be implemented in accordance with the following:

- Posted speed limits within closures should be set at 15 miles per hour.
- Signs are to be installed approximately 250 feet in advance of and behind the work zone to alert drivers who may approach from either direction of the upcoming work zone.
- The work area is to be completely delineated with Type 1 barricades (candlesticks).
- Any vehicle used for AECOM field work shall be equipped with a functioning rotating beacon placed on the roof of the vehicle.

5.0 Records

5.1 Traffic Protection Plans and completed Equipment Checklists will be maintained in project files.

COMMENTS:

S3NA-307-PR Housekeeping, Worksite

1.0 Purpose and Scope

- 1.1 This procedure provides AECOM's work practices as well as personal hygiene and work site sanitation standards for housekeeping.
- 1.2 Applies to all AECOM North America-based staff and field worksites.

2.0 Terms and Definitions

- 2.1 None

3.0 Attachments

- 3.1 None

4.0 Procedure

4.1 Roles and Responsibilities

- 4.1.1 **Project Manager (Field Task Manager, Supervisor)** is responsible for the procedure's implementation and the details of addressing housekeeping policy within the construction/demolition worksite.
- 4.1.2 **SH&E Department** personnel will monitor, assess, and report on project housekeeping when visiting locations.
- 4.1.3 **Employees** are responsible for reporting any areas of concern to the Site Supervisor for prompt resolution as well as for maintaining worksites that are free from debris, clutter, and slipping or tripping hazards.

4.2 Smoking, Eating, and Drinking

- 4.2.1 Eating and drinking will be permitted in designated areas at AECOM project sites and as specified on client sites. Smoking will be permitted only in areas designated in compliance with applicable local laws, regulations, legislation, and ordinances, by the Field Supervisor and situated in locations that are not in the immediate vicinity of activities associated with work site activities. Additionally, Field Supervisor will designate each smoking area giving primary consideration to those personnel who do not smoke.
- 4.2.2 Personnel involved in the performance of certain activities will not be permitted to smoke, eat, drink, or use smokeless tobacco, except during breaks (e.g., HAZWOPER-controlled work areas).
- 4.2.3 Site personnel will first wash hands and face after completing work activities and prior to eating or drinking.

4.3 Water Supply

- 4.3.1 Water supplies will be available for use on site and will comply with the following requirements:
- 4.3.2 **Potable Water:** An adequate supply of drinking water will be available for site personnel consumption. Potable water can be provided in the form of approved well or city water, bottled water, or drinking fountains. Where drinking fountains are not available, individual use cups will be provided as well as adequate disposal containers. Potable water containers will be properly identified in order to distinguish them from nonpotable water sources.
- 4.3.3 **Nonpotable Water:** Nonpotable water will not be used for drinking purposes. Nonpotable water may not be used for hand washing or other personal hygiene activities but may be used for other types of cleaning activities. All containers/supplies of nonpotable water used will be properly identified and labeled as such.

4.4 Toilet Facilities

- 4.4.1 Toilet facilities will be available for site personnel and visitors. Should subcontractor personnel be located on-site for extended periods, it may become necessary to obtain temporary toilet facilities.

Exceptions to this requirement will apply to mobile crews where work activities and locations permit transportation to nearby toilet facilities.

- 4.4.2 A minimum of one toilet will be provided for every 20 site personnel, with separate toilets maintained for each sex, except where there are less than five total personnel on site. For mobile crews where work activities and locations permit use of nearby toilet facilities (e.g., gas station, or rest stop), on-site facilities are not required.

4.4.3 Washing Facilities

- 4.4.4 Hand and Face: Site personnel will wash hands and face after completing work activities and prior to breaks, lunch, or completion of workday.

- 4.4.5 Personal Cleaning Supplies: Cleaning supplies at AECOM project sites will consist of soap, water, and disposable paper towels or items of equal use/application (e.g., anti-bacterial gels, wipes, etc.).

4.5 Clothing and Personal Protective Equipment (PPE)

- 4.5.1 All PPE will be kept clean at all times and maintained in accordance with the manufacturer's, AECOM's, and applicable regulatory, legislative, or provincial requirements.

4.5.2 General Work Areas

- 4.5.3 At all times work areas will be kept free of dirt and debris that may impact the safety of site personnel and visitors. All trash receptacles will be emptied regularly.

4.5.4 Break Areas and Lunchrooms

Site personnel will observe the following requirements when using break areas and lunchrooms at AECOM project sites:

- 4.5.5 All food and drink items will be properly stored when not in use.
- 4.5.6 Food items will not be stored in personal lockers for extended periods in order to prevent the potential for vermin infestation.
- 4.5.7 Perishable foods will be refrigerated whenever possible.
- 4.5.8 All waste food containers will be discarded in trash receptacles.
- 4.5.9 All tables, chairs, counters, sinks, and similar surfaces will be kept clean and free of dirt, waste food, and food containers at all times.
- 4.5.10 Refrigerators used to store food items will be maintained at 45 degrees Fahrenheit and emptied of all unclaimed food items weekly. Refrigerators used to store food will be labeled as such so that only food and drinks are stored within the refrigerator.
- 4.5.11 Routine cleaning of refrigerators will also be performed on a regular basis.

4.6 Vermin Control

- 4.6.1 Every enclosed workplace shall be constructed, equipped, and maintained, so far as reasonably practicable, to prevent the entrance or harborage of rodents, insects, and other vermin.
- 4.6.2 A continuing and effective extermination program shall be instituted where the presence of rodents, insects, or other vermin is detected.

4.7 General Housekeeping

- 4.7.1 All work areas shall be kept clean to the extent that the nature of the work allows.
- 4.7.2 Every work area shall be maintained, so far as practicable, in a dry condition. Where wet processes are used, drainage shall be maintained and platforms, mats, or other dry standing places shall be provided, where practicable, or appropriate waterproof footwear shall be provided.
- 4.7.3 Protruding objects or placement of materials on paths or foot traffic areas present a problem with regard to slips, trips, falls, and puncture wounds. Personnel will use a reasonable amount of effort to keep slip, trip, and fall hazards to a minimum.
- 4.7.4 Excess debris and trash will be collected and stored in an appropriate container (e.g., plastic trash bags, garbage can, roll-off bin) prior to disposal.
- 4.7.5 At no time will debris or trash be intermingled with waste PPE or contaminated materials.

- 4.7.6 Material and equipment must be placed, stacked, or stored in a stable and secure manner. Stacked material or containers must be stabilized as necessary by interlocking, strapping, or other effective means of restraint to protect the safety of workers.
- 4.7.7 An area in which material may be dropped, dumped, or spilled must be guarded to prevent inadvertent entry by workers or protected by adequate covers and guarding.
- 4.7.8 Floors, platforms, ramps, stairs, and walkways available for use by workers must be maintained in a state of good repair and kept free of slipping and tripping hazards. If such areas are taken out of service, the employer must take reasonable means for preventing entry or use.
- 4.7.9 Hazardous areas not intended to be accessible to workers must be secured by locked doors or equivalent means of security and must not be entered unless safe work procedures are developed and followed.

4.8 **Worksite Offices and Trailers**

Worksite offices and trailers will be maintained in accordance with *S3NA-103-PR Housekeeping, Office*.

5.0 **Records**

- 5.1 None

6.0 **References**

- 6.1 None

S3NA-308-PR Manual Lifting, Field

1.0 Purpose and Scope

- 1.1 This procedure provides the requirements for use when performing manual materials handling activities (e.g., lifting/handling of items or materials).
- 1.2 This procedure applies to all field staff for AECOM North America-based operations.

2.0 Terms and Definitions

- 2.1 **Manual Materials Handling:** Moving or handling things by lifting, lowering, pushing, pulling, carrying, holding, or restraining.
- 2.2 **Team Handling:** Team handling occurs when more than one person is involved during the lift.

3.0 Attachments

- 3.1 S3NA-308-WI Manual Lifting Safe Work Practices

4.0 Procedure

4.1 Roles and Responsibilities

- 4.1.1 The **Project Manager** will effectively implement the procedure, providing resources as required, and providing direction on proper lifting/handling techniques.
- 4.1.2 The **Region SH&E Manager** will assist in identifying activities with a high potential for lifting/handling strains/injuries as well as the associated mitigation strategies and training on proper lifting/manual materials handling techniques.
- 4.1.3 **Employees** are responsible for reviewing and following *S3NA-308-WI Manual Lifting Safe Work Practices*.

4.2 Mechanical Controls

- 4.2.1 Mechanical equipment or assistance such as dollies, carts, come-alongs, or rollers are preferable to be used whenever possible rather than the employee physically moving materials.
- 4.2.2 Mechanical assistance will be of proper size, have wheels sized for the terrain, and be designed to prevent pinching or undue stress on wrists.
- 4.2.3 Objects to be moved will be secured to prevent falling and properly balanced to prevent tipping.

4.3 Administrative Controls

- 4.4 When significant, sustained lifting work is required, it is desirable to rotate employees to spread the work load among several people and thereby avoid fatigue.
- 4.5 Rotation is not simply performing a different job but instead is performing a job that utilizes a completely different muscle group from the ones that have been overexerted.

5.0 Records

- 5.1 None

S3NA-308-WI Manual Lifting Safe Work Practices

1.0 General

1.1 Before Performing a Lift:

- 1.1.1 Check to see if mechanical aids such as hoists, lift trucks/dollies, or wheelbarrows are available.
- 1.1.2 Do not lift if you are not sure that you can handle the load safely.
- 1.1.3 Confirm that, based on your own physical capabilities and medical limitations, you can lift the load without overexertion. Get help with heavy or awkward loads.
- 1.1.4 Confirm that the load is “free” to move.
- 1.1.5 Check that the planned destination of the load is free of obstacles and debris.
- 1.1.6 Confirm that the path to the planned destination of the load is clear. Grease, oil, water, litter, and debris can cause slips and falls.
- 1.1.7 Particular handling and lifting techniques are needed for different kinds of loads or materials being handled (for example, compact loads, small bags, large sacks, drums, barrels, cylinders, and sheet materials like metal or glass). See Section 2.0 for additional guidance.

1.2 General Tips for Lifting

- 1.2.1 Prepare for the lift by warming up the muscles.
- 1.2.2 Make certain that your balance is good. Feet should be shoulder width apart, with one foot beside and the other foot behind the object that is to be lifted.
- 1.2.3 Bend the knees; do not stoop. Keep the back straight, but not vertical. There is a difference. Tucking in the chin straightens the back.
- 1.2.4 Grip the load with the palms of your hands and your fingers. The palm grip is much more secure. Tuck in the chin again to make certain your back is straight before starting to lift.
- 1.2.5 Use your body weight to start the load moving, then lift by pushing up with the legs. This makes full use of the strongest set of muscles.
- 1.2.6 Keep the arms and elbows close to the body while lifting.
- 1.2.7 Carry the load close to the body. Do not twist your body while carrying the load. To change direction, shift your foot position and turn your whole body.
- 1.2.8 Watch where you are going!
- 1.2.9 To lower the object, bend the knees. Do not stoop. To deposit the load on a bench or shelf, place it on the edge and push it into position. Confirm that your hands and feet are clear when placing the load.

1.3 Engineering Controls:

- 1.3.1 Material handling tasks should be designed to minimize the weight, range of motion, and frequency of the activity.
- 1.3.2 Alter the task to eliminate the hazardous motion and/or change the position of the object in relation to the employee's body—such as adjusting the height of a pallet or shelf.
- 1.3.3 Work methods and stations should be designed to minimize the distance between the person and the object being handled.
- 1.3.4 High-strength push-pull requirements are undesirable, but pushing is better than pulling. Material handling equipment should be easy to move, with handles that can be easily grasped in an upright posture.
- 1.3.5 Workbench or workstation configurations can force people to bend over. Corrections should emphasize adjustments necessary for the employee to remain in a relaxed upright stance or fully supported seated posture. Bending the upper body and spine to reach into a bin or container is highly

undesirable. The bins should be elevated, tilted, or equipped with collapsible sides to improve access.

- 1.3.6 Repetitive or sustained twisting, stretching, or leaning to one side are undesirable. Corrections could include repositioning bins and moving employees closer to parts and conveyors.

- 1.3.7 Store heavy objects at waist level.

- 1.4 Whenever possible, utilize hand holds or other lifting attachments on objects being handled:**

- 1.4.1 Use the “hook grip” on loads with cut-out handholds.
- 1.4.2 Curl your fingers around the edge.
- 1.4.3 Do not hold the load with your fingertips.
- 1.4.4 Use containers with handles located more than halfway up the side of the container.
- 1.4.5 Use the “ledge grip” to handle regularly shaped objects without handles.

- 1.4.6 Use vacuum lifters to handle sheet materials or plates.
- 1.4.7 Hold the object with hands placed diagonally.
- 1.4.8 Wear gloves where practical.

2.0 Specific Handling Techniques

The following guidance will be used when performing manual materials handling for various types of materials.

2.1 Square or Rectangular Objects

- 2.1.1 Place one foot slightly in front of the other.
- 2.1.2 Squat as close to the object as possible.
- 2.1.3 Grasp one of the top corners away from the body and the opposite bottom corner closest to the body.
- 2.1.4 Tilt the object slightly away from the body, tilt forward at the hips, keep the back straight, and tuck in the chin.
- 2.1.5 Test to confirm that the object is loose from floor and will lift without snagging.
- 2.1.6 Straighten the legs, keeping the backbone straight, pull the object into the body, and stand up slowly and evenly without jerking or twisting.

2.1.7 If turning or change of direction is required, turn with feet without twisting the torso and step in the direction of travel.

2.1.8 To set an object down, reverse the sequence, being sure not to trap the bottom hand between the object and the surface on which the object is set.

2.2 Cylindrical Objects

2.2.1 When lifting/moving round or cylindrical objects, the objects should be rolled wherever possible. Rolling must be controlled by chute, tagline, or other means of limiting acceleration. Workers must not be positioned downhill from rolled objects. Use of the legs for pushing and tagline control of rolled objects must be stressed.

2.2.2 Cylindrical objects, such as drums that must remain upright, are to be handled manually by slightly tilting the object, using the legs for control, and balancing the object on the bottom edge. The handler then walks besides the object, with the object tilted toward the body, positioning the hands on the top edge away from the body and moving so they do not cross, thus maintaining balance and a steady, controlled, forward motion. Motion must be controlled so that ceasing to walk and moving the hands will stop forward motion.

2.2.3 Use carts or tracks to transport cylinders. Make sure that two people transport a cylinder if carts cannot be used, use lifting straps to improve grip.

- Technique for one person lifting a cylinder onto a platform:
 - Roll the cylinder to within 3 feet of the platform.
 - Position the forward foot around the cylinder, the back foot about 1 foot behind the cylinder.
 - Bend knees slightly.
 - Place one hand on the valve protective cap, the other hand underneath the cylinder about 1 foot from the ground.
 - Tilt the cylinder onto the thigh of the back leg.
 - Balance the cylinder on the thigh by pressing down with the back hand while lifting the cylinder with the forward hand.
 - Extend both knees to initiate forward movement of the cylinder and continue by pushing up and forward with the arms until the cylinder is located on the platform.
 - Climb on the platform.
 - Straddle the cylinder at the valve end.
 - Grasp the valve protective cap of the cylinder with both hands between the thighs.
 - Lean forward and straighten the knees to set the cylinder upright.

2.3 Bags and Sacks

2.3.1 The best way to handle a bag depends on its size, weight, and how far it is to be carried. When lifting, remember to

- Straddle the end of the bag.
- Bend the hips and knees.
- Keep the back straight.
- Grasp the bag with both hands under the closer end. Keep elbows inside the thighs.
- Lean forward, straightening the knees to set the bag upright.
- Readjust the straddle position moving feet closer to the bag.
- Readjust the grasp, with one hand clasping the bag against the body and the other under it.
- Stand up by thrusting off with the back leg and continuing in an upward and forward direction.
- Thrust the bag up with the knee while straightening the body.
- Put the bag on the shoulder opposite the knee used to thrust the bag up.
- Stabilize the bag on the shoulder.

- Move off without bending sideways.
- 2.3.2 Avoid unloading a bag from the shoulder directly to floor level. Use an intermediate platform or get help from a coworker.
- Stand close to the platform.
 - Place one foot in front of the platform.
 - Bend hips and knees.
 - Keep the back straight.
 - Ease the bag off the shoulder and put it upright on the platform.
 - Pull the bag slightly over the edge of the platform.
 - Stand close to the platform with the bag touching the chest.
 - Clasp the bag against the body with one hand, the other hand holding bottom of the bag.
 - Step back.
 - Bend hips and knees, keeping back straight.
 - Ease the bag onto the floor.
- 2.3.3 Bulkier sacks are easier to carry on your back. Lift the sack onto your back from a platform:
- Move the sack to the edge of the platform.
 - Put your back against the sack.
 - Grasp with both hands on the upper corners of the sack.
 - Ease the sack onto the back, bending hips and knees before taking the weight.
 - Keep the back straight.
 - Stand up and straighten the hips and knees.
 - Stabilize the sack.
 - Move away without bending sideways.
- 2.3.4 Two-person handling of a sack:
- Position one person on either side of the sack.
 - Squat with one foot balancing behind the sack.
 - Keep back straight.
 - Grasp with the outer hand on the upper corner, the other hand holding the bottom of the sack.
 - On one person's command:
 - Stand up and straighten the hips and knees.
 - Move toward the stack.
 - Put the sack on the stack.
- 2.4 Sheet Materials**
- 2.4.1 When lifting sheet materials:
- Stand close to the pile of sheets in a walking stance.
 - Grasp sheet firmly at the midpoint of its long side with the closer hand.
 - Pull sheet up and toward the body.
 - Change grip using your other hand and put your fingers on top of the sheet.
 - Pull sheet up to the vertical position and to the side until one half is off the pile.
 - Grasp the lower edge of the sheet with the free hand and support the hand by placing it on your knee.
 - Stand up without bending or twisting body.

- Whenever moving sheet materials, be cognizant of wind conditions.
- 2.4.2 To carry sheets:
- Use drywall carts to carry sheet materials.
 - Get help from another person where carts are not available.
 - Apply carrying handles for manual carrying.
 - Always use gloves and carrying handle for glass and other materials with sharp edges.
- 2.4.3 Use team lifting and carrying where other solutions are inappropriate.
- Remember that the combined strength of the team is less than the sum of individual strength.
 - Select team members of similar height and strength.
 - Assign a leader to the team.
 - Determine a set of commands to be used such as "lift," "walk," "stop," and "down." Make sure that everyone knows what to do when they hear the command.
 - Follow the commands given by the team leader.
 - Practice team lifting and carrying together before attempting the task.

2.5 Material Storage

- 2.5.1 When storing materials on site:
- Store materials at a convenient height.
 - Leave the lowest shelf unused if necessary.
 - Use vertically mobile shelves to avoid bending and overhead reaching.
 - Use bin racks for storing small items.
 - Store heavy and frequently used materials at waist height.
 - Do not store materials at floor level.
 - Use hand trucks with elevating devices in storage and loading areas.
 - Use trucks with a tilting device to avoid bending.
 - Use elevating platforms to avoid overhead reaching.

S3NA-309-PR Mobile or Heavy Equipment

1.0 Purpose and Scope

- 1.1 Outline the safe working requirements for working with and near mobile equipment and heavy equipment operation.
- 1.2 This procedure applies to all AECOM North America based employees and operations.

2.0 Terms and Definitions

- 2.1 **Heavy equipment:** All excavating equipment include scrapers, loaders, crawler or wheel tractors, excavators, backhoes, bulldozers, off-highway trucks, graders, agricultural and industrial tractors, and similar equipment.
- 2.2 **Operator:** Any person who operates the controls while the heavy equipment is in motion or the engine is running.
- 2.3 **Ground personnel/workers:** Personnel performing work on the ground around heavy equipment (note: operators are considered ground personnel when outside of the equipment cab).

3.0 Attachments

- 3.1 S3NA-309-FM1 Certification of Machinery and Mechanized Equipment
- 3.2 S3NA-309-FM2 Heavy Machinery Pre-Operation Checklist
- 3.3 S3NA-309-WI Brokk180 Safety Card

4.0 Procedure

- 4.1 For work under AECOM's control, Project Managers are responsible for ensuring all equipment is in good working order and all equipment operators are qualified on the piece of machinery they are assigned.
- 4.2 Staff will confirm that all rented equipment arrives in proper working order with the manufacturer's operating manual before acceptance from the supplier.
- 4.3 The operator of mobile equipment is the only worker permitted to ride the equipment unless the equipment is a worker transportation vehicle.
- 4.4 A person will not operate mobile equipment unless the person has received adequate instruction and training in the safe use of the equipment, has demonstrated to a qualified supervisor or instructor competency in operating the equipment.
- 4.5 The operator of mobile equipment will operate the equipment safely, maintain full control of the equipment, and comply with the laws governing the operation of the equipment

4.6 Communication

- 4.6.1 Communication between site supervisors/managers, heavy equipment operators, and other site personnel is a key method of preventing serious injury or death during heavy equipment operations.
- 4.6.2 The following outline the communication requirements during heavy equipment operations:
 - Site supervisors/managers shall confirm that all operators are notified/informed of when, where, and how many ground personnel will be working on site.
 - Site supervisors/managers shall inform all ground personnel before changes are made in the locations of designated work areas.
 - Prior to work initiating onsite the site supervisor/manager is to confirm all operators and ground personnel are trained on the hand signals that will be used to communicate between operators and ground personnel.
 - Personnel working around heavy equipment operations are to maintain eye contact with operators to the greatest extent possible (always face equipment). Never approach equipment from a blind spot or angle.

- All heavy equipment whose backup view can be obstructed shall be equipped with reverse warning devices (i.e., backup alarms) that can be significantly heard over equipment and other background noise. Reverse signaling lights shall be in working order.
- When feasible, two-way radios shall be used to verify the location of nearby ground personnel.
- When an operator cannot adequately survey the working or traveling zone, a guide shall use a standard set of hand signals to provide directions. Flags or other high visibility devices may be used to highlight these signals.

4.7 **Ground Personnel**

4.7.1 Ground clearance around heavy equipment may significantly reduce hazards posed during heavy equipment operations.

4.7.2 The following outline the clearance requirements during heavy equipment operations:

- Ground personnel shall always yield to heavy equipment.
- Ground personnel shall maintain a suitable “buffer” area of clearance from all active heavy equipment.
- A job-specific hazard analysis that identifies any special precautions shall be completed and communicated to all AECOM personnel.
- Site supervisors/managers shall designate areas of heavy equipment operation and confirm that all ground personnel are aware of designated areas. Designated areas shall include boundaries and travel routes for heavy equipment. Travel routes shall be set up to reduce crossing of heavy equipment paths and to keep heavy equipment away from ground personnel.
- When feasible, site supervisors/managers shall set up physical barriers (e.g., caution tape, orange cones, concrete jersey barriers) around designated areas and confirm that unauthorized ground personnel do not enter such areas.
- Operators shall stop work whenever unauthorized personnel or equipment enter the designated area and only resume when the area has been cleared.
- Operators shall only move equipment when aware of the location of all workers and when the travel path is clear.
- Ground personnel shall never stand between two pieces of heavy equipment or other objects (i.e., steel support beams, trees, buildings, etc.).
- Ground personnel shall never stand directly below heavy equipment located on higher ground.
- If working near heavy equipment, ground personnel shall stay out of the travel and swing areas (excavators, all-terrain forklifts, hoists, etc.) of all heavy equipment.
- Ground personnel shall never work near heavy equipment.
- Personnel shall keep all extremities, hair, tools, and loose clothing away from pinch points and other moving parts on heavy equipment.
- Personnel shall not talk on a cell phone while standing or walking on a roadway or other mobile equipment path.

4.7.3 At a minimum, all ground personnel and operators outside of heavy equipment shall wear the following:

- High visibility, reflective (Class 2) safety vest that is visible from all angles and made of fluorescent material and orange, white, or yellow reflective material (confirm that vest is not faded or covered with outer garments, dirt, etc.).
- Retro-reflective striping for arms and legs (night work)
- ANSI-CSA approved hard hat
- ANSI-CSA approved safety glasses with side shields
- ANSI-CSA approved work boots (unless project requirements are more stringent)
- ANSI-CSA approved hearing protection as needed
- Appropriate work clothes (i.e., full length jeans/trousers and a sleeved shirt; no tank, crew tops or other loose clothing permitted).

4.8 Prior to work commencing

- 4.8.1 All mobile equipment will be regularly inspected pre-shift and then regularly as required with the details of the inspection recorded in a log book.
- 4.8.2 The operator will report defects and conditions affecting the safe operation of the equipment to the supervisor or employer. Any repair or adjustment necessary for the safe operation of the equipment will be made before the equipment is used.
- 4.8.3 Exposed moving parts on mobile equipment which are a hazard to the operator or to other workers will be guarded and if a part will be exposed for proper function it will be guarded as much as is practicable consistent with the intended function of the component.
- 4.8.4 An approved Underwriter's Laboratories (UL) 4A40BC fire extinguisher should be present on all mobile equipment.
- 4.8.5 Inform the operators of the equipment that AECOM employees are in the area and inquire if there are any restricted areas or specific rules or requirements. In some industrial facilities, mobile equipment has the 'right of way'.
- 4.8.6 Where the operator will not have a full view of the path of travel, a signal person will be used on the ground that has a full view of the load, the operator, and the path.
- 4.8.7 Mobile equipment in which the operator cannot directly or by mirror or other effective device see immediately behind the machine will have an automatic audible warning device which activates whenever the equipment controls are positioned to move the equipment in reverse, and if practicable, is audible above the ambient noise level.

4.9 Operation

- 4.9.1 The operator of mobile equipment will operate the equipment safely, maintain full control of the equipment, and comply with the laws governing the operation of the equipment.
- 4.9.2 A supervisor will not knowingly operate or permit a worker to operate mobile equipment which is, or could create, an undue hazard to the health or safety of any person.
- 4.9.3 The operator of mobile equipment will not leave the controls unattended unless the equipment has been secured against inadvertent movement such as by setting the parking brake, placing the transmission in the manufacturer's specified park position, and by chocking wheels where necessary.
- 4.9.4 The operator will maintain the cab, floor and deck of mobile equipment free of material, tools or other objects which could create a tripping hazard, interfere with the operation of controls, or be a hazard to the operator or other occupants in the event of an accident.
- 4.9.5 If mobile equipment has seat belts required by law or manufacturer's specifications, the operator and passengers will use the belts whenever the equipment is in motion, or engaged in an operation which could cause the equipment to become unstable.
- 4.9.6 When approaching or crossing the intended path of travel of mobile equipment, establish eye contact with the operator of the mobile equipment and confirm that it is safe to proceed.
- 4.9.7 Have vehicle headlights on at all times when driving in the area.
- 4.9.8 Park motor vehicles off the haul roads, or away from the work areas.
- 4.9.9 Do not wear loose clothing where there is a danger of entanglement in rotating equipment.
- 4.9.10 Do not enter the swing area of machines such as cranes, mobile drill rigs, or excavators, without first making eye contact with the operator, and receiving permission to do so.
- 4.9.11 Stay out of the blind areas around mobile equipment and never assume that the equipment operators have seen them or are aware of their presence.
- 4.9.12 Maintain a distance of 60 cm (2 ft.) between the counterweight of swing machines and the nearest obstacle. If this distance cannot be maintained, the area will be barricaded or guarded to prevent access.
- 4.9.13 Vibration from moving traffic or mobile equipment can cause excavations or spoil piles to become unstable. Be aware of the risk and keep clear.
- 4.9.14 All heavy equipment shall be operated in a safe manner that will not endanger persons or property.
- 4.9.15 All heavy equipment shall be operated at safe speeds.

- 4.9.16 Always move heavy equipment up and down the face of a slope. Never move equipment across the face of a slope.
- 4.9.17 Slow down and stay as far away as possible while operating near steep slopes, shoulders, ditches, cuts, or excavations.
- 4.9.18 When feasible, operators shall travel with the "load trailing", if the load obstructs the forward view of the operator.
- 4.9.19 Slow down and sound horn when approaching a blind curve or intersection. Flagmen equipped with 2-way radio communications may be required to adequately control traffic.
- 4.9.20 Operators shall remain in cab while heavy equipment is being loaded.
- 4.9.21 Equipment shall be shut down prior to and during fueling. Do not smoke or use electrical devices while fueling. Fuel shall not be carried in or on heavy equipment, except in permanent fuel tanks or approved safety cans.
- 4.9.22 Turn off heavy equipment, place gear in neutral and set parking brake prior to leaving vehicle unattended. Buckets and blades are to be placed on the ground and with hydraulic gears in neutral. Heavy equipment parked on slopes shall have the wheels chocked.
- 4.9.23 Never jump on to or off of a piece of heavy equipment, always maintain 3-points of contact at a minimum.
- 4.9.24 Never exit heavy equipment while it is in motion.
- 4.9.25 Passengers shall only ride in heavy equipment designed for occupancy of passengers.
- 4.9.26 Never ride on the outside of a piece of heavy equipment (e.g., tailgates, buckets, steps, etc.).
- 4.9.27 Site vehicles will be parked in a designated parking location away from heavy equipment.
- 4.9.28 Operators shall never push/pull "stuck" or "broken-down" equipment unless a spotter determines that the area is cleared of all personnel around and underneath the equipment.
- 4.9.29 If designated for work in contaminated areas/zones, equipment shall be kept in the exclusion zone until work or the shift has been completed. Equipment will be decontaminated within designated decontamination areas.
- 4.9.30 Equipment left unattended at night adjacent to traveled roadways shall have appropriate lights or reflectors, or barricades equipped with appropriate lights or reflectors, to identify the location of that equipment, and shall not be closer than 6 feet (or the regulatory requirement for the work location) to the active roadway.
- 4.9.31 Pneumatic-tired earthmoving haulage equipment, with a maximum speed exceeding 15 miles per hour, shall be equipped with fenders on all wheels.
- 4.9.32 Lift trucks shall have the rated capacity clearly posted on the vehicle, and the ratings are not exceeded.
- 4.9.33 Steering or spinner knobs shall not be attached to steering wheels.
- 4.9.34 High lift rider industrial trucks shall be equipped with overhead guards.
- 4.9.35 When ascending or descending grades in excess of 5%, loaded trucks shall be driven with the load upgrade.
- 4.9.36 All belts, gears, shafts, pulleys, sprockets, spindles, drums, flywheels, chains, or other reciprocating, rotating or moving parts of equipment shall be guarded when exposed to contact by persons or when they otherwise create a hazard.
- 4.9.37 All hot surfaces of equipment, including exhaust pipes or other lines, shall be guarded or insulated to prevent injury and fire.
- 4.9.38 All equipment having a charging skip shall be provided with guards on both sides and open end of the skip area to prevent persons from walking under the skip while it is elevated.
- 4.9.39 Platforms, foot walks, steps, handholds, guardrails, and toeboards shall be designed, constructed, and installed on machinery and equipment to provide safe footing and access ways.
- 4.9.40 Substantial overhead protection shall be provided for the operators of fork lifts and similar equipment.
- 4.10 **Utilities**

- 4.10.1 When contacted by heavy equipment, aboveground and underground utilities may cause severe injuries or death as a result of electrocution, explosion, etc.
- 4.10.2 The following outline the requirements while performing heavy equipment operations that may lead to contact with aboveground or underground utilities:
- Always be aware of surrounding utilities.
 - Confirm all equipment (i.e., dump trailers, loaders, excavators, etc.) is lowered prior to moving underneath of aboveground utilities.
 - Confirm utilities are cleared and identified prior to beginning any earthmoving operation. Contact the local utility service providers for clearance prior to performing work. Confirm documentation of the contact is made; date, number; contact name, organization, etc.

4.11 **Training**

- 4.11.1 The operator or other qualified supervisor will provide all on-site personnel with an orientation to the mobile equipment and its associated hazards and controls.
- 4.11.2 Only designated, qualified personnel shall operate heavy equipment.
- 4.11.3 Operators shall have all appropriate local, state, or federal licenses or training to operate a designated piece of heavy equipment.
- 4.11.4 Operators shall be evaluated through documented experience and routine monitoring of activities unless the equipment is operated by an AECOM operator in which case a practical evaluation is needed. Operators shall be knowledgeable and competent in the operation of a designated piece of heavy equipment.

4.12 **Inspection and Maintenance**

- 4.12.1 Maintenance records for any service, repair or modification which affects the safe performance of the equipment will be maintained and be reasonably available to the operator and maintenance personnel during work hours.
- 4.12.2 Maintenance records will be maintained on the site or project for mobile equipment.
- 4.12.3 Servicing, maintenance and repair of mobile equipment will not be done when the equipment is operating, unless continued operation is essential to the process and a safe means is provided.
- 4.12.4 All heavy equipment shall have a documented inspection and if necessary, repaired prior to use. Operators shall not operate heavy equipment that has not been cleared for use. All machinery and mechanized equipment will be certified to be in safe operating condition (certification form attached) by a competent individual seven days prior to on-site operation, and is valid for one year.
- 4.12.5 All heavy equipment shall be inspected at a minimum to the manufacturer's recommendations prior to each work shift. All defects shall be reported to the site supervisor/manager immediately. Inspection records shall be maintained at the site. If a manufacturer's or company-specific inspection checklist is not provided, use the Heavy Equipment Pre-Operation Inspection Checklist (attached).
- 4.12.6 Defective heavy equipment shall be immediately taken out of service until repaired.

4.13 **Fueling and batteries**

- 4.13.1 A well-ventilated area shall be used for refueling.
- 4.13.2 Only the type and quality of fuel recommended by the engine manufacturer shall be used.
- 4.13.3 Fuel tanks shall not be filled while the engine is running. All electrical switches shall be turned off.
- 4.13.4 No one shall spill fuel on hot surfaces. Any spillage should be cleaned before starting an engine.
- 4.13.5 Spilled fuel shall be cleaned with cotton rags or cloths; do not use wool or metallic cloth.
- 4.13.6 Open flames, lighted smoking materials, or sparking equipment shall remain well away from the fueling area.
- 4.13.7 Heaters in carrier cabs shall be turned off when refueling the carrier or the drill rig.
- 4.13.8 Portable fuel containers shall not be filled completely to allow expansion of the fuel during temperature changes.

- 4.13.9 The fuel nozzle shall be kept in contact with the tank being filled to prevent static sparks from igniting the fuel.
- 4.13.10 Portable fuel containers shall not travel in the vehicle or carrier cab with personnel.
- 4.13.11 Fuel containers and transfer hoses shall be kept in contact with a metal surface during travel to prevent buildup of a static charge.
- 4.13.12 Batteries shall be serviced in a ventilated area while wearing appropriate PPE.
- 4.13.13 When a battery is removed from a vehicle or service unit, the battery shall be disconnected ground post first.
- 4.13.14 When installing a battery, the battery shall be connected ground post last.
- 4.13.15 When charging a battery, cell caps shall be loosened prior to charging to permit gas to escape.
- 4.13.16 When charging a battery, the power source shall be turned off to the battery before either connecting or disconnecting charger loads to the battery posts.
- 4.13.17 Spilled battery acid shall be immediately flushed off the skin with a continuous supply of water.
- 4.13.18 Should battery acid get into the eyes, the eyes shall be flushed immediately with copious amounts of water and medical attention sought immediately.
- 4.13.19 To avoid battery explosions, the cells shall be filled with electrolytes. A flashlight (not an open flame) shall be used to check water electrolyte levels. Avoid creating sparks around battery by shorting across a battery terminal. Lighted smoking materials and flames shall be kept at least 25 feet away from battery-charging stations.

5.0 Records

- 5.1 Inspection records shall be maintained with the equipment.

6.0 References

- 6.1 S3NA-205-PR Equipment Inspections & Maintenance

S3NA-309-FM1 Certification of Machinery and Mechanized Equipment

1.0 General Guidelines

- 1.1 Subcontractor equipment shall comply with all applicable requirements for motor vehicles and material handling heavy equipment contained in 29 CFR 1926 Subpart O. Heavy equipment includes, but is not limited to, drill rigs, front end loaders, backhoes, trackhoes, bulldozers, forklifts, and similar equipment used for the implementation of the project Statement of Work.

2.0 Equipment Safety Inspections

- 2.1 The following presents general guidelines for certifying equipment is in safe operating condition before activities commence at the site and during site operations. The following guidelines are not meant to be all-inclusive.
- 2.1.1 All machinery and mechanized equipment will be certified to be in safe operating condition (using the attached form) by a competent individual seven days prior to onsite operation. This certification is valid for one year.
- 2.1.2 Equipment will be inspected on a daily basis by the owner/operator and daily logs will be maintained. All discrepancies shall be corrected prior to placing the equipment in service.
- 2.1.3 Inspections shall include, but are not limited to, all hydraulic lines and fittings for wear and damage, all cable systems and pull ropes for damage and proper installation, exhaust systems, brake systems, and drill controls, etc.
- 2.1.4 Drill rigs and related support equipment and vehicles shall be inspected by the driller in charge on a daily basis. These inspections shall be recorded on the Daily Drill Rig Checklist or on equivalent subcontractor forms.
- 2.1.5 Exhaustive preventive maintenance shall be conducted for all equipment according to manufacturer recommendations and/or the subcontractor's internal policies, schedules, and equipment SOPs.
- 2.1.6 Only designated qualified persons shall operate machinery and mechanized equipment.
- 2.1.7 The contractor shall maintain records of tests and inspections at the site and shall make the records available upon request of the designated authority; the records shall become part of the official project file.
- 2.1.8 Equipment found to not be in safe operating condition or to have a deficiency that affects the safe operation of the equipment shall immediately be taken out of service and its use shall be prohibited until safe conditions have been corrected.
- 2.1.9 All equipment shall be kept in the exclusion zone until work or the shift has been completed. Equipment will be decontaminated within designated decontamination areas.
- 2.1.10 Equipment with an obstructed rear view must have an audible alarm that sounds when equipment is moving in reverse.

TO: AECOM

S3NA-309-WI Brokk180 Safety Card

1.0 Objective/Overview

The Brokk 180 is an electric-powered hydraulic device used for demolishing concrete structures and refractory linings as well as excavating. This machine includes attachments designed exclusively for demolishing work (e.g., grapple, bucket, hydraulic hammer, etc.). By using the remote control unit, an operator can move the machine and attachments in different directions and speeds from afar.

2.0 Safe Operating Guidelines

- 2.1 Prior to use, complete a pre-operation inspection to determine if the unit is in safe working condition.
- 2.2 Position the unit to safely perform the intended task, then deploy the outriggers to stabilize the unit.
- 2.3 Confirm that the operator knows what the lifting capacity is; do not exceed the lifting capacity.
- 2.4 Complete a subsurface utility clearance prior to excavating.
- 2.5 Establish a minimum 15-foot clearance around the unit.
- 2.6 Do not allow debris to build-up around the unit. Maintain good housekeeping practices.
- 2.7 Prior to removing debris from under the boom, stop, disengage the unit, and position the boom so that the attachment is at rest on the ground.
- 2.8 Personnel operating the unit with the remote control device will be properly trained and certified by a competent person.
- 2.9 The operator will be able to maintain line of sight visual contact with the unit at all times to assess hazards and site security.
- 2.10 Maintenance in excess of preventive maintenance activities (e.g., lubrication, replenishing fluids, etc.) will be performed by manufacturer personnel ONLY.
- 2.11 All operations will comply with the manufacturer's recommended policies.

3.0 Potential Hazards

- 3.1 Flying debris.
- 3.2 Crush/impact/pinch from extendable boom, tracks, and tipping over.
- 3.3 Electrocution from subsurface utilities (when excavating).
- 3.4 Hearing loss.

4.0 Training Requirements

- 4.1 Review of applicable SOPs.
- 4.2 Complete knowledge and understanding of remote control functions.
- 4.3 Review and follow manufacturers' recommended policies and practices.

5.0 Personal Protective Equipment (Level D ensemble)

- 5.1 Reflective traffic safety vest.
- 5.2 Hearing protection (ear plugs and/or ear muffs).
- 5.3 Leather gloves.

6.0 Other Safety Tips

- 6.1 Never stand under a raised boom.
- 6.2 Maintain a clearance of 15 feet around the unit while operating.
- 6.3 Pay close attention to power cords for potential tripping hazard and equipment entanglement.
- 6.4 Maintain line of sight visual contact with unit at all times (especially when operating from a distance).

S3NA-310-PR Rigging, Hoisting, Cranes, and Lifting Devices

1.0 Purpose and Scope

- 1.1 Establishes the minimum requirements for rigging, hoisting, and crane operations.
- 1.2 This procedure applies to all AECOM North America- based employees and operations.

2.0 Terms and Definitions

- 2.1 **ASME:** American Society of Mechanical Engineers
- 2.2 **Assembly/Disassembly Director(A/D Director):** An individual who meets this subpart's requirements for an A/D director, irrespective of the person's formal job title or whether the person is nonmanagement or management personnel. Assembly/disassembly will be directed by a person who meets the criteria for both a competent person and a qualified person or by a competent person who is assisted by one or more qualified persons. If the assembly/disassembly is being performed by only one person, that person will meet the criteria for both a competent person and a qualified person. For purposes of this standard, that person is considered the A/D director.
- 2.3 **Crane:** Any power-operated equipment that can hoist, lower, and horizontally move a suspended load.
- 2.4 **Critical lifts:** Hoisting operations in which a critical item or load is hoisted or moved, or in which a noncritical item is hoisted or moved in an area where critical systems or equipment could be affected. Critical lifts are lifting operations that exceed 75 percent of the crane's rated capacity or any activity involving a part, component, assembly, or piece of equipment ("item") whose dropping, upset, or collision could cause or result in the following:
 - Damage that would result in serious economic consequences.
 - Damage that would result in an unacceptable delay to schedule or other significant deleterious programmatic impact (such as the loss of vital data).
 - Undetectable damage that would jeopardize the future operations or safety of a facility.
 - A significant release of hazardous material to the environment or the creation of an undesirable condition.
 - Personnel injury or significant adverse health impact, either onsite or offsite.
- 2.5 **Controlling Entity:** An employer that is a prime contractor, general contractor, construction manager or any other legal entity that has the overall responsibility for the construction of the project, including planning, quality, and completion.

3.0 Attachments

- 3.1 S3NA-310-FM1 Crane Pre-Operation Inspection
- 3.2 S3NA-310-FM2 Critical Lift Checklist

4.0 Procedure

4.1 Roles and Responsibilities

- 4.1.1 **Project Managers (includes Supervisors)** are responsible for confirming that all aspects of this procedure are followed and adhered to on all AECOM sites and locations for critical lifts for which AECOM is the controlling entity.

4.2 General Requirements

- 4.2.1 AECOM personnel will not operate powered cranes and/or tuggers without approval from the **Project Manager, Region SH&E Manager, and legal.**

4.2.2 Some AECOM project sites may require the setup and use of tower cranes, hydraulic cranes, boom trucks, or helicopters to facilitate movement of equipment or materials on the site or project. The hazards and controls associated with these activities will be documented on the Project Safety Plan and communicated to all site personnel before work commences.

4.2.3 Prior to mobilization, **PMs** will confirm that cranes and crane operators, signal persons, and riggers are certified/qualified and that a Crane Pre-Operational Inspection Checklist (see *S3NA-310-FM1 Crane Pre-Operation Inspection* or its equivalent) is completed and reviewed prior to each use/shift.

4.3 **Assembly/Disassembly**

4.3.1 Prior to assembly of any cranes, all crews will confirm:

- Their tasks.
- The hazard associated with their tasks.
- Hazardous locations they need to avoid.

4.3.2 Should a crew member change a task then that crew member will be instructed that the above requirement will be met.

4.3.3 No assembly/disassembly of cranes shall be performed underneath power lines.

4.4 **Addressing Specific Hazards**

4.4.1 The assembly/disassembly director supervising the operation will address the following hazards associated with the operation:

- Site and ground bearing conditions will be adequate for safe operation and to support the equipment.
- Blocking material will be sufficient in size, amount, condition, and method of stacking to sustain loads and maintain stability.
- Proper location of blocking. When used to support lattice booms or components, blocking will be appropriately placed to protect the structural integrity of the equipment and prevent dangerous movement and collapse.
- Verifying assist crane loads. Loads that will be imposed on the assist crane at each phase will be verified before operations begin.
- Boom and jib pack points. The attachment points of rigging to a boom/ boom sections, or to jib/jib sections, will be suitable for preventing structural damage and for facilitating safe handling of the components.
- The center of gravity will be identified, if necessary, for the method used for maintaining stability.
- Measures designed to prevent unintended dangerous movement will be used where there is insufficient information.
- Stability upon pin removal. Boom sections, boom suspension systems, and components will be rigged or supported to maintain stability upon the removal of the pins.
- Snagging. Suspension ropes and pendants will not be able to catch on the boom or jib connection pins or cotter pins (including keepers and locking pins).
- Struck by counterweights. The potential for unintended movement from inadequately supported counterweights and from hoisting counterweights.
- Boom hoist brake failure. The brake will be tested prior to each time reliance is to be placed on the boom hoist brake to prevent boom movement.
- If found to be insufficient, a boom hoist pawl, other locking/back-up braking device, or another method of preventing dangerous boom movement (such as blocking or using an assist crane) from a boom hoist failure will be used.
- Loss of backward stability. Backward stability before swinging upward, during travel, and when attaching or removing equipment components.
- Wind speed and weather. The effect of wind speed and weather on the equipment.

4.5 **Prerequisites and Physical Qualifications**

- 4.5.1 Operators, riggers, and inspectors shall meet the minimum requirements established by this procedure as it relates to their work.
- 4.5.2 As part of this procedure, all site-specific training shall be in accordance with procedure *S3NA-209-PR Project Hazard Assessment and Planning* and 29 CFR Part 1926.1400 Cranes and Derricks in Construction.
- All sling and hoist systems used on AECOM sites will be operated, inspected, and maintained in compliance with regulations.
 - AECOM will only employ qualified/certified licensed equipment operators, signal persons, and riggers (for cranes, helicopters, etc.).

4.6 Personal Protective Equipment

- 4.6.1 All AECOM personnel operating lifting or hoisting equipment and/or functioning as riggers or signal persons shall wear a reflective equipment.
- Hard hats
 - Steel-toed boots
 - Reflective vest
- 4.6.2 Class II high visibility vest in addition to their normal personal protective Power Line Safety gear.
- 4.6.3 All cranes shall maintain the following minimal clearance distance from power lines.

Voltage (nominal, kV, alternating current)	Minimum clearance distance (feet)
Up to 50	10
Over 50 to 200	15
Over 200 to 350	20
Over 350 to 500	25
Over 500 to 750	35
Over 750 to 1000	45
Over 1000	As established by the utility owner/operator.

4.7 Training Programs

- 4.7.1 Power Line Safety Training
- Each operator and crew member assigned to work with the equipment will be trained on Power Line Safety.
 - Spotter: Workers as dedicated spotters will be trained to enable them to effectively perform their task under section 29 CFR 1926. 1430(g) as applicable in the US.
 - Fall Protection: Any AECOM employee will be trained who may be exposed to fall hazards while on or hoisted when exposed to a fall greater than 6 feet.
 - Crush/Pinch points: All AECOM employees who work with the equipment shall be trained to keep clear of holes and crush/pinch points (i.e., work area controls).

4.8 Basic Operator Training

- 4.8.1 Topics to be included in the basic certification criteria operator training programs shall include as a minimum the requirements listed below:
- The individual knows the information necessary for safe operation of the specific type of equipment the individual will operate, including the following:

- The controls and operating/performance characteristics.
- Use of and the ability to calculate (manually or with a calculator) load/capacity information on a variety of configuration of the equipment.
- Procedure for preventing and responding to power line contact.
- Technical knowledge:
 - Wire rope.
 - Rigging devices and their use.
 - Technical limitations of protective measure against electrical hazards.
 - The effects of load share and load transfer in multi-crane lifts.
 - Basic crane terms.
 - The basics of machine power flow systems.
 - The significance of the instruments and gauge reading.
 - The effects of thermal expansion and contraction in hydraulic cylinders.
 - Background information necessary to understand preoperation and inspection requirements.
 - How to use the safety devices and operation aids required under 29 CFR 1926.1415 and 1416.
 - How to calculate net capacity for every possible configuration of the equipment using the manufacturer's load chart.
 - How to use manufacturer-approved attachments and their effect on the equipment.
 - How to obtain dimensions, weight, and center of gravity of the load.
 - The effect of dynamic loading from wind, stopping and starting, impact loading, and moving with the load.
 - The effects of side loading.
 - The principles of backward stability.
 - Site information.
 - How to identify the suitability of the supporting ground.
 - Proper use of mats, blocking/cribbing, outriggers, stabilizers, or crawlers.
 - Identification of site hazards.
 - How to review operation plans with supervisors and other workers.
 - How to determine if there is adequate room for extension of cralers or outriggers/stabilizers and counterweights.
 - How to pick up, carry, swing, and place the load smoothly and safety on rubber tires and on outriggers/stabilizer or crawlers.
 - Proper procedure and methods of reeving wire ropes.
 - How to react to change in conditions.
 - How to shut down and secure the equipment properly while leaving it unattended.
 - Know how to apply the manufacturers' specification for operating in various weather conditions and understand how environmental conditions affect the safe operation of the equipment.
 - How to properly lever the equipment.
 - How to verify the weight of the load and rigging prior to initiating the lift.
 - How to determine where the load is to be picked up and placed and how to verity the radii.
 - Know basic rigging procedures.

- How to carry out the shift inspection.
- Know that the following operations require specific procedures and skill levels:
 - Multi crane lifts.
 - Hoisting personnel.
 - Clamshell/dragline operations.
 - Pile driving and extracting.
 - Demolition operations.
 - Operations on water.
 - Multi drum operation.
- Know the proper procedure for load control and the use of handheld tag lines.
- Know the emergency response site procedures.
- Any necessary repairs or adjustments needed for the equipment will be communicated to all affected employees at the beginning of the shift.
- Other topics identified by the training or operating organizations.

4.9 **Basic Training for Signal Person**

4.9.1 Topics to be included in the basic certification criteria signal person training programs shall include as a minimum the requirements listed below:

- Know and understand the type of signal used.
- Know and understand the standard method of hand signaling.
- Have a basic understanding of equipment operation and limitations, including the crane dynamics involved in swinging and stopping loads and boom deflection from hoisting load.
- Demonstrate that the signal person meets the requirements of 29 CFR 1926, 1400 through an oral or written test and through a practical test.

4.10 **Basic Training for Special Equipment Operators**

4.10.1 Operators of special equipment will first complete training requirements for the most applicable equipment category, such as overhead, gantry, and polar cranes; hoists; or mobile cranes. The operator of special equipment will then complete any additional classroom instruction required specific to that equipment, and will complete an on-the-job (OJT) training program for the special equipment.

4.11 **Rigger Training Programs**

4.11.1 It is recommended that training for riggers be divided into two categories:

- Training for personnel who do rigging as a major part of their job assignment.
- Training for personnel who do simple rigging jobs as an incidental part of their job assignment.

4.11.2 Topics in both categories shall include the same basics but the depth of detail shall match the job assignment.

4.11.3 Topics shall include the requirements listed below:

- Equipment operating characteristics, capabilities, and limitations.
- Use and inspection of slings, wire rope, chain, and synthetic fiber.
- Effect of sling angles on resultant sling loads.
- Restriction on use of come-alongs.
- Determination of load weights, load-weight calculations, and individual sling loads.
- Use of load-indicating devices.
- Safe work practices.
- Hand signals and communications between the signal person and operator.

- Use and inspection of all major rigging accessories or assemblies.
- Critical lift classifications and requirements.
- Use of spreader bars and other below-the-hook lifting devices.

4.12 **Crane Inspection Training**

4.12.1 Inspector training shall be established to train personnel in the inspection categories listed below.

- Overhead, gantry, and polar cranes.
- Monorail, jib, and other hoists.
- Mobile cranes.
- Wire rope.
- Rigging and rigging hardware.
- Special equipment.

4.13 **Inspector Training Subcategories**

4.13.1 To meet the needs of the discipline, the training may divide these categories into subcategories. For example, an inspector may be trained to inspect only mechanical portions of monorail hoists.

4.14 **Scope of Inspector Training**

4.14.1 Inspector training shall include basic inspection techniques and the application of manufacturer-supplied information, OSHA, ASME, and acceptance/rejection criteria.

4.15 **Testing and Examination**

4.15.1 Testing Phases

- Testing for operator, rigger, and inspector classifications shall include, as a minimum, a written examination comprised of questions covering training topics and a practical examination to demonstrate knowledge of equipment operating characteristics and practical application. A qualified instructor shall grade the practical examination. Documentation of training shall be maintained on site.

4.15.2 Examination Scores

- Scope standards shall be set for each examination by the training organization. The minimum passing score shall depend on the subject, testing technique, and test difficulty. A candidate may be given additional opportunities to take and pass the examination if the materials have been reviewed and the employee tests satisfactorily.

4.16 **Qualification, Requalification, or Disqualification**

4.16.1 Training Certificate

- After the training, testing, and OJT (if required) is successfully completed, a certificate shall be issued to the operator, rigger, or inspector. The operator's certificate shall list the equipment the operator is qualified to operate.

4.16.2 Qualification Period

- Operator, signal person, rigger, and inspector qualifications may be dependent on state or local regulations.

4.16.3 Refresher Training

- AECOM will provide refresher training on relevant topics for each employee based on the employee's conduct or an evaluation of the employee's knowledge or another indication that retraining is warranted. If for any reason the employee's manager determines that the employee should be disqualified, the manager shall write a letter of disqualification. This written statement of disqualification shall state the reason for disqualification and when, or if, the employee will be eligible to requalify.

4.17 **Critical Lift Procedure**

4.17.1 Critical Lift Plan

- Prior to commencing any critical lift activity, the PM will confirm that a Crane Pre-Operational Inspection Checklist and a Critical Lift Checklist (see attachments) are prepared for all critical lifts.
- 4.17.2 Critical Lift Plan Approval
- The Crane Operator and the Rigging Site Supervisor will review and approve the Critical Lift Plan (procedure); on projects that AECOM controls, the SH&E Department will also review and approve the Critical Lift Plan.
 - Revisions to the procedure will be reviewed and approved in the same manner as the original procedure.
- 4.17.3 Pre-Lift Meeting
- Before the Critical Lift is performed, a safety meeting with participating personnel will be held. During this meeting, the relevant portions of the applicable Task Hazard Analysis (THA) will be covered, the Critical Lift procedure will be reviewed, and questions/concerns related to personnel involved in the lift and operation of equipment will be resolved. The safety meeting will be documented on a Tailgate Safety Briefing Form as required by *S3NA-210- PR Project Safety Meetings*.
- 4.17.4 Critical Lift Plan Documentation
- Once completed, the SH&E Department will maintain copies of the Critical Lift Plan. Documentation of a critical lift will include the following:
 - The Critical Lift Checklist, recording job completion with approval signatures.
 - Documentation of the safety meeting including, at a minimum, the meeting date and list of attendees.
 - Any additional documentation deemed appropriate by the SH&E Department or other responsible personnel (e.g., lessons learned).
- 4.17.5 Preparing for Rigging & Hoisting
- The passing of loads over client facility equipment, trailers, public roads, and sidewalks shall only be done if the necessary precautions have been taken for the safety of all workers and other persons.
 - When operating conditions are such that the boom of the crane swings over property lines or operating transportation systems for the site or project, the owners of adjacent properties or systems shall be consulted. A diagram should be prepared detailing the proposed swing paths for the crane.
 - All rigging equipment, fittings, and devices will be of adequate strength for the application. All components will be capable of supporting at least five times the maximum load to which they may be subjected. If the load exceeds 85 percent of the equipment capacity or involves multi-lifts, hoisting and rigging operations will be approved by a professional engineer.
 - At no time is the operator of the equipment to perform lifts that exceed the load rated capacity of the equipment.
 - Only loads that have been properly rigged or have been placed in containers designed for hoisting may be lifted.
 - Loads should only be rigged for hoisting by qualified persons.
 - Inspect all slings before each use and maintain them in good condition. All ropes, hardware, and other fittings will be inspected regularly for wear, cracks, severe corrosion, kinks, bird caging, broken strands, burn marks, chemical damage, deformation, or other signs of obvious damage.
 - Use slings of proper reach. Never shorten a line by twisting or knotting or with chain slings. Never use bolts and nuts.
 - Estimate the center of gravity or point of balance. The lifting device should be positioned immediately above the estimated center of gravity.
 - Select shackle and sling sizes that exceed the minimum working load limits.
 - The signaller will be properly identified and will understand proper signaling techniques.

- Hoisting areas will be secured with a barrier in areas where public access is a concern. Appropriate warning signage will be posted to indicate that overhead work is being performed in the area.
- Wire ropes will be lubricated to reduce friction between wires and strands.
- Tag lines will be used to control loads.
- When two or more slings are to be connected to a hook, a shackle should be used.

4.18 **During Transport of the Load**

- When being assisted by a signal person ("spotter"), the equipment operator will maintain continuous communication with the signal person. If communication with the signal person is lost, the operator will not continue until communication has been restored.
- All personnel will be clear of the load being lifted and the load will be double-checked to ensure that it is secure before it is lifted.
- No one shall be permitted to ride the lifting hook, ball, or load.
- At no time are loads to be passed over any workers or other persons.
- No one shall pass under any part of a suspended load. Always try to anticipate the movement of the load and avoid entering the swing path of the load.
- Prepare a place to land the load and lower the load gently to keep it stable before slackening the sling or chain.
- Stay clear of loads when slings are being pulled out from underneath.
- Loose loads will be blocked before unhooking.
- If you are using a sling, a significant amount of electrical charge is generated by a helicopter and rain or light blowing snow can increase this electrical charge. To avoid receiving a stunning (but not harmful) shock, the hookup person (who is trying to unhook the load) should resist reaching up to the machine or the cable as it hovers over the load. It is important to let the load or the cable ground itself first. Under some conditions the current can arc up to 20 centimeters.

5.0 **Records**

- 5.1 All training records shall be maintained in accordance with *S3NA-003-PR SH&E Training*.
- 5.2 All inspection records will be maintained on site with the machine.

S3NA-310-FM1 Crane Pre-Operation Inspection

PROJECT INFORMATION	
Project Name:	
Project/Contract Number:	Date:
Site Safety Coordinator:	Crane Operator:
Crane Model No:	Crane Manufacturer:
Crane Number:	Hours:
GENERAL REQUIREMENTS	
1. Safety Manager has reviewed and accepted work platform use	<input type="checkbox"/> Yes <input type="checkbox"/> No
2. Job Hazard Analysis completed and attached.....	<input type="checkbox"/> Yes <input type="checkbox"/> No
3. Critical Lift Checklist completed and attached	<input type="checkbox"/> Yes <input type="checkbox"/> No
4. Area barricaded or otherwise secured from unauthorized personnel entrance.....	<input type="checkbox"/> Yes <input type="checkbox"/> No
CRANE REQUIREMENTS	
5. Load lines are capable of supporting 5 times maximum intended load (10 times for rotation-resistant wire rope)	<input type="checkbox"/> Yes <input type="checkbox"/> No
6. Total weight of loaded platform and related rigging does not exceed 50 percent of rated capacity per boom angle and radius.....	<input type="checkbox"/> Yes <input type="checkbox"/> No
7. Crane does not have live boom; load line hoist is regulated with a device other than the hoist brake that regulates lowering speed.	<input type="checkbox"/> Yes <input type="checkbox"/> No
8. Crane has a positive acting anti-two-block device that deactivates hoisting action	<input type="checkbox"/> Yes <input type="checkbox"/> No
9. Boom angle indicator is functional and readily visible to the operator	<input type="checkbox"/> Yes <input type="checkbox"/> No
RIGGING REQUIREMENTS	
10. Wire rope, shackles, and other rigging hardware are capable of supporting 5 times the maximum intended load.....	<input type="checkbox"/> Yes <input type="checkbox"/> No
11. Lifting bridles are four legs of equal length connected by common ring.....	<input type="checkbox"/> Yes <input type="checkbox"/> No
12. All eyes in wire rope slings are fabricated with thimbles	<input type="checkbox"/> Yes <input type="checkbox"/> No
13. Shackle bolts are secured against displacement (pinned or moused)	<input type="checkbox"/> Yes <input type="checkbox"/> No
14. Safety line passes through the eye of each bridle leg and is attached above the headache ball or to the crane hook.....	<input type="checkbox"/> Yes <input type="checkbox"/> No
15. Hook throat opening has been closed by pinning, bolting, or mousing safety latch.....	<input type="checkbox"/> Yes <input type="checkbox"/> No
16. Rigging is dedicated for platform use and is not used for any other purpose when not hoisting personnel.....	<input type="checkbox"/> Yes <input type="checkbox"/> No
PLATFORM REQUIREMENTS	
17. Platform is posted with its weight and rated load capacity or maximum intended load	<input type="checkbox"/> Yes <input type="checkbox"/> No
18. A grab rail is installed inside the entire perimeter of the platform.....	<input type="checkbox"/> Yes <input type="checkbox"/> No
19. Access gates, if installed, do not swing outward and have a device to prevent accidental opening	<input type="checkbox"/> Yes <input type="checkbox"/> No
20. In addition to hard hats, employees are afforded overhead protection by the platform when exposed to falling objects.....	<input type="checkbox"/> Yes <input type="checkbox"/> No
21. All edges exposed to employee contact are smoothed to prevent injury from punctures or lacerations.....	<input type="checkbox"/> Yes <input type="checkbox"/> No
PLATFORM LOADING	
22. The platform is not loaded in excess of its rated capacity	<input type="checkbox"/> Yes <input type="checkbox"/> No
23. The number of employees does not exceed the number required for the work to be performed.....	<input type="checkbox"/> Yes <input type="checkbox"/> No
24. The platform is not used to hoist tools or materials except for those necessary for employees to perform the work.....	<input type="checkbox"/> Yes <input type="checkbox"/> No
25. Personnel, tools, and materials are evenly distributed within the platform	<input type="checkbox"/> Yes <input type="checkbox"/> No

PROOF-TESTING, TRIAL LIFT, AND INSPECTION

26. The platform and rigging has been proof tested to 1.25 times the rated capacity (minimum duration, 5 minutes) ☐ Yes ☐ No
27. After proof testing, the platform has been inspected for deficiencies ☐ Yes ☐ No
28. Loaded at least to anticipated weight, a trial lift from the ground to each location the platform is to be hoisted and positioned has been conducted (may be done concurrently with proof testing and must be repeated if the crane is repositioned). ☐ Yes ☐ No
29. After trial lift and prior to hoisting employees, an inspection has been made to ensure that the hoist rope is free of kinks, that multiple lines (if used) are not twisted around each other, that the primary attachment is centered over the platform, and that the load rope is properly stated on drums and sheaves. ☐ Yes ☐ No

OTHER

30. Tag lines are attached and ready for use, or a determination has been made that the use of tag lines creates an unsafe condition ☐ Yes ☐ No
31. A pre-lift meeting with all affected employees has been conducted ☐ Yes ☐ No
32. There is no adverse weather condition, winds are less than 15 mph, and there is no electrical storm activity or heavy rain ☐ Yes ☐ No
33. Employees will remain in continuous sight of and in communication with the operator or signal person. If radios are used, they have been tested..... ☐ Yes ☐ No
34. Employees have been tied off with full body harness above the headache ball, or to the load block ☐ Yes ☐ No

S3NA-310-FM2 Critical Lift Checklist

A critical lift is any lift that exceeds 75% of the crane's rated capacity, involves more than one crane, involves unusual or severe hazards, or any lift the PM identifies as Critical.

ADMINISTRATIVE INFORMATION:	
PROJECT NAME:	
PROJECT MANAGER (PM):	DATE:
SUBCONTRACTOR NAME:	SUBCONTRACTOR PM:
SUPERVISOR IN CHARGE:	CRANE OPERATOR:
SIGNAL PERSON 1:	SIGNAL PERSON 2:
CRITICAL LIFT REQUIREMENTS:	
1. <u>LIFT CONDITIONS:</u> a. Crane pad level, firm & stable <input type="checkbox"/> Yes <input type="checkbox"/> No b. Has longest lift radius been identified <input type="checkbox"/> Yes <input type="checkbox"/> No c. Have special hazards been identified <input type="checkbox"/> Yes <input type="checkbox"/> No i. Power lines <input type="checkbox"/> Yes <input type="checkbox"/> No ii. Obstructions in lift path <input type="checkbox"/> Yes <input type="checkbox"/> No iii. Location of utilities and structures <input type="checkbox"/> Yes <input type="checkbox"/> No iv. Weather conditions <input type="checkbox"/> Yes <input type="checkbox"/> No d. Has a lift sequence been established and reviewed <input type="checkbox"/> Yes <input type="checkbox"/> No e. Are personnel clear of lift area <input type="checkbox"/> Yes <input type="checkbox"/> No	
2. <u>LOAD CONDITIONS:</u> a. Is exact load weight known <input type="checkbox"/> Yes <input type="checkbox"/> No _____ Pounds b. Is weight of rigging known <input type="checkbox"/> Yes <input type="checkbox"/> No _____ Pounds c. Is the weight of the load block and line known <input type="checkbox"/> Yes <input type="checkbox"/> No _____ Pounds d. Has the center of gravity of the load been established <input type="checkbox"/> Yes <input type="checkbox"/> No e. Is rigging adequate and in good condition <input type="checkbox"/> Yes <input type="checkbox"/> No	
3. <u>COMMUNICATIONS:</u> a. Have hand signals been reviewed <input type="checkbox"/> Yes <input type="checkbox"/> No b. Has location of spotters been established <input type="checkbox"/> Yes <input type="checkbox"/> No c. If radios are used: <input type="checkbox"/> Yes <input type="checkbox"/> No i. Have they been tested from location of use <input type="checkbox"/> Yes <input type="checkbox"/> No ii. Is frequency clear of other radio traffic <input type="checkbox"/> Yes <input type="checkbox"/> No	
4. <u>CONDITION OF CRANE (CHECKED BY OPERATOR):</u> a. Is pad blocking adequate and substantial <input type="checkbox"/> Yes <input type="checkbox"/> No b. Is the crane level <input type="checkbox"/> Yes <input type="checkbox"/> No c. Are ropes and pendants in good condition <input type="checkbox"/> Yes <input type="checkbox"/> No d. Are adequate parts of line being used <input type="checkbox"/> Yes <input type="checkbox"/> No e. Is line revved properly <input type="checkbox"/> Yes <input type="checkbox"/> No f. Are controls in good working condition to insure smooth operation <input type="checkbox"/> Yes <input type="checkbox"/> No g. Is the load within chart limits for the above conditions <input type="checkbox"/> Yes <input type="checkbox"/> No h. What is the boom length i. What is the maximum boom angle j. What is the maximum load radius	
5. <u>PRE-LIFT MEETING:</u> Has a pre-lift meeting been conducted with all persons involved to review this information <input type="checkbox"/> Yes <input type="checkbox"/> No	
6. <u>LIFT DIAGRAM (INCLUDE CRANE SETUP, RADIUS, LOAD, ETC.):</u> 	

APPROVAL SIGNATURES:	
SUBCONTRACTOR SUPERVISOR IN CHARGE:	SUBCONTRACTOR PM:
AECOM PROJECT MANAGER:	AECOM SAFETY REPRESENTATIVE:

S3NA-313-PR Wildlife, Plants and Insects

1.0 Purpose and Scope

- 1.1 Communicates the requirements and precautions to be taken by AECOM employees to protect against the biological hazards associated with insects, arachnids, snakes, poisonous plants, and other animals referred to herein collectively as “biological hazards”.
- 1.2 This procedure applies to all AECOM North America (NA) based employees and operations.

2.0 Terms and Definitions

- 2.1 **Field Work:** Field work is defined as any activity conducted at a site that contains brush, overgrown grass, leaf litter, poisonous plants, or is located near mosquito breeding areas and includes work in structures where animals might exist that harbor fleas or ticks or where spiders and mites could be present. Field work includes, but is not limited to, Phase I, Phase II, Operations Monitoring & Maintenance (OM&M), biological surveys, and other work that meets the definition of field work.
- 2.2 **Poisonous:** Capable of harming or killing by or as if by poison; toxic or venomous.
- 2.3 **Phase I Environmental Site Assessment:** Investigation of real property to determine the possibility of contamination, based on visual observation and property history, but no physical testing. Under new Environmental Protection Agency regulations that went into effect on November 1, 2006, a Phase I, as it is called for short, will be mandatory for all investors who wish to take advantage of CERCLA defenses that will shield them from liability for future cleanup, should that prove necessary. The new Phase I rules, called “All Appropriate Inquiry” or AAI, also require more investigation than previously mandated. Investors can expect to see dramatic price increases over prior experiences.
- 2.4 **Phase II Environmental Site Assessment:** Investigation of real property through physical samplings and analyses to determine the nature and extent of contamination and, if indicated, a description of the recommended remediation method.

4.0 Procedure

4.1 Roles and Responsibilities

4.1.1 Project Managers and Supervisors

- **Project Managers** and **Supervisors** responsible for managing field work will work with employees conducting the work to see that a Task Hazard Analysis (THA) for the work to be conducted has been performed prior to the beginning of the field work and that it includes an assessment of potential biological hazards.
- If biological hazards are identified as an exposure risk in the workplace, control measures that may be applied at the project site will be implemented to reduce the potential for employees to be exposed to injuries and illnesses while working.
- If the exposures cannot be eliminated or managed with engineering controls, the **Project Manager** or **Supervisor** will approve the use of PPE and protective repellents and lotions and ensure that exposed employees have and use these products.

4.1.2 District Operations Manager

- Approve the costs associated with the PPE and materials necessary to protect employees from the biological hazards covered by this Procedure.
- During the performance of project site visits, managers will assess the precautions being taken against the requirements of this Procedure.

4.1.3 Region SH&E Manager

- Participate in incident reporting and investigations when appropriate.
- Work with office SH&E Department and project Safety Professionals, provide training and guidance to employees consistent with this procedure.
- Assist project teams in identifying hazards and selecting appropriate control measures.

4.1.4 Operational Managers

- Assure implementation of this procedure in their regions and offices.
- Participate in incident reporting and investigations when appropriate.

4.1.5 Employees

- Participate in required training on this procedure.
- Participate in the development of THAs for the project, identify control measures to limit exposure and request PPE, repellents, and protective lotions required by this Procedure.
- Obtain approval from **Project Managers** and/or **Supervisors** to purchase selected PPE prior to purchasing.
- Implement the precautions appropriate to prevent exposure to the hazardous wildlife, insects and plants.
- Observe requirements for reporting as detailed within the Procedure.
- Participate in incident reporting and investigations when appropriate.

4.2 Overview

4.2.1 The procedures discussed below are detailed because these hazards have historically posed the most significant risk to AECOM **employees**. Note that this discussion is not a fully encompassing list of hazards and as part of the Task Hazard Analysis conducted by the project team, additional consideration must be given to other biological hazards.

4.2.2 Departments of Public Health local to the worksite, as well as the Centers for Disease Control (CDC) can serve as a resource for identifying biological hazards not discussed in this Procedure.

4.2.3 If additional biological hazards are identified, the project team should contact the **Region SH&E Manager** to discuss the hazards and identify effective control measures that can be implemented at the project site.

4.3 Planning and Hazard Assessment

- 4.3.1 The AECOM project team shall ensure that the potential for exposure to specific biological hazards are assessed prior to the commencement of work and that the procedures specified by this SOP are integrated into the project planning process and conveyed to AECOM employees conducting the field work. This information shall be communicated in the site specific Safe Work Plan (SWP), Health and Safety Plan (HASP), the THA, pre-project kickoff meetings, and tailgate meetings at the project site.
- 4.3.2 It is important to note that the precautions to be taken by AECOM **employees** to decrease the risk of exposure to biological hazards can directly increase the risk of heat-related illness due to thermal stresses. Therefore, heat stress monitoring and precautions shall be included as a critical component of the project-specific hazard assessments in accordance with *S3NA-511-PR Heat Stress*.
- 4.3.3 During the preparation of the project specific Safe Work Plan (SWP), HASP and project specific THA, **Project Managers, Supervisors**, and the project staff will determine what biological hazards might be encountered during the project and will prescribe the precautions to be taken to reduce the potential for exposure and the severity of resulting illnesses. Consideration will be given to conditions such as weather, proximity to breeding areas, host animals, and published information discussing the presence of the hazards.
- 4.3.4 It should be assumed that at least one of the biological hazards exists whenever working on undeveloped property. This can include insect activity any time that local temperatures exceed 40°F for a period of more than 24 hours. The stubble and roots of poisonous plants can be a hazard any time of year, including when some plants are dormant or mown.
- 4.3.5 The hazard assessments must also consider the additional hazards posed by vegetative clearing such as the increased risk of coming in contact with poison ivy, oak or sumac and hazards associated with the use of tools and equipment to remove vegetation.
- 4.3.6 **Employees** in the field where biological hazards exist will not enter the hazard areas unless they are wearing the appropriate protective clothing, repellents, and barrier creams specified below. If the hazard is recognized in the field but was not adequately assessed during the THA, the affected employees shall stop work and not proceed until the THA has been amended and protective measures implemented.
- 4.3.7 A decision flow chart and table for determining the potential for biological hazards in US states has been provided in *S3NA-313-WI1 Biological Hazard Assessment Decision Flow Chart Hazard Assessment (US States)*.

4.4 Restrictions

- 4.4.1 Staff with life-threatening reactions shall not undertake work in areas infested with the allergen (e.g., wasps, poison ivy), unless precautions are met which satisfy a medical practitioner's requirements.

4.5 Employee Sensitivity

- 4.5.1 Sensitivity to toxins generated by plants, insects and animals varies according to dosage and the ability of the victim to process the toxin, therefore it is difficult to predict whether a reaction will occur, or how severe the reaction will be. Staff should be aware that there are a large number of organisms capable of causing serious irritations and allergic reactions. Some reactions will only erupt if a secondary exposure to sunlight occurs. Depending on the severity of the reaction, the result can be severe scarring, blindness or even death.
- 4.5.2 **Employees** also need to consider whether they are sensitive to the use of insect repellents.

4.6 Personal Protective Equipment

- 4.6.1 The selection of Personal Protective Equipment is dependent on the hazard present and a PPE Hazard Analysis should be conducted to determine situation specific PPE required. (refer to SOP *S3NA-208 Personal Protective Equipment Program*)
- 4.6.2 At a minimum, in addition to any project specific PPE, long sleeves and pants should be worn on field projects where the risk of biological encounter exists.
- 4.6.3 PPE for insects should include sunscreen, bug nets, bug jackets, or insect repellent. Socks should be pulled over pant legs and rubber boots should be worn where the threat of exposure is anticipated.

- 4.6.4 Epi-pens¹ or other personal medication should be carried by those staff that are aware that anaphylactic shock is a possibility for them.

4.7 Remedies

- 4.7.1 If you suspect exposure to an irritant, identify the cause including obtaining a specimen if possible. Document the occurrence as a safety precaution if the exposure should lead to complications.
- 4.7.2 Go to a doctor or call WorkCare for advice if necessary.

4.8 Training

- 4.8.1 Field staff must learn to recognize organisms that represent a threat in the regions in which they work – experienced field staff must provide on the job training to assist staff with hazard recognition.
- 4.8.2 Staff who have severe allergic reactions are strongly recommended to notify their project manager, field supervisor, and co-workers of the potential for a reaction and demonstrate what medication they might need and how it is administered.

4.9 Insects

- 4.9.1 Insects for which precautionary measures should be taken include but are not limited to: mosquitoes (potential carriers of disease aside from dermatitis), black flies, wasps, bees, ticks, Fire Ants and European Fire Ants.
- 4.9.2 Wasps and bees will cause a painful sting to anyone if they are harassed. They are of most concern for individuals with allergic reactions who can go into anaphylactic shock. Also, instances where an individual is exposed to multiple stings can cause a serious health concern for anyone. These insects are most likely to sting when their hive or nest is threatened.
- 4.9.3 Ticks can be encountered when walking in tall grass or shrubs. They crawl up clothing searching for exposed skin where they will insert mouthparts to drink blood. The most serious concern is a possibility of contracting Lyme disease which is spread by the Black-legged or Deer Tick. The larger Wood Ticks are widespread in the west but these rarely carry diseases. Occasionally a tick can cause Tick Paralysis if it is able to remain feeding for several days. Full recovery usually occurs shortly after the tick is removed.
- 4.9.4 The Fire Ant (southern and western US) and the European Fire Ant (northeastern US and eastern Canada) is often very abundant where it is established. It is very aggressive and commonly climbs up clothing and stings unprovoked when it comes into contact with skin. Painful irritations will persist for an hour or more.

4.10 Ticks

- 4.10.1 Data from the CDC indicates that tick-borne diseases have become increasingly prevalent. At the same time, tick repellents have become both safe and effective so it is possible to prevent the vast majority of bites and therefore most related illnesses.
- 4.10.2 The most common and severe tick-borne illnesses in the U.S. are Lyme disease, Ehrlichiosis, and Rocky Mountain spotted fever. A summary table listing CDC informational resources for these diseases is provided in *S3NA-313-W/2 Ticks* along with a listing of CDC information resources and maps showing the distribution of common tick-borne diseases in the U.S.
- 4.10.3 When working in areas where ticks may occur, it is recommended that clothes are turned inside out and shaken at the end of day; do not wear the same clothes two days in a row.
- 4.10.4 To remove ticks that are embedded in skin, use tweezers or fingers to carefully grasp the tick as close to the skin as possible and pull slowly upward, avoiding twisting or crushing the tick. Do not try to burn or smother the tick. Cleanse the bite area with soap and water, alcohol, or household antiseptic. Note the date and location of the bite and save the tick in a secure container such as an empty pill vial or film canister. A bit of moistened paper towel placed inside the container will keep ticks from drying out.

¹ Epi-pens must be prescribed by a personal physician. Renew epi-pens on a regular schedule to ensure effectiveness and make sure your field companions know where it is and how to use it if you cannot self administer the dose.

- 4.10.5 Familiarize yourself with the characteristic bulls-eye pattern of Lyme disease infection surrounding the bite. If noted, report to medical help for inoculation.
- 4.10.6 If possible, submit any ticks found or captured to the following laboratories for species identification.
- Canada – National Microbiology Laboratory (NML) (Phone: (204) 789-2000; email: ticks@phac-aspc.gc.ca). The NML will conduct diagnostic testing for the Lyme disease agent as well as several other disease-causing agents. The NML results will not only benefit anyone bit by the tick, but will also assist the NML in their goal to accurately map the distribution of the tick species and associated diseases in Canada.
 - US – IGeneX, Inc. (Phone: (800) 832-3200; www.igenex.com). IGeneX will test the tick for the presence of the Lyme bacteria. They also test ticks for *Babesia microti* and/or *Babesia duncani* (formerly WA-1), Ehrlichia, Bartonella henselae and Rickettsia (Rocky Mountain Spotted Fever). These diseases are also carried by ticks. The testing request form is attached as *S3NA-313-FM Tick Test Request Form*.
- 4.10.7 If you experience symptoms such as fever, headache, fatigue, and a skin rash, you should immediately visit a medical practitioner as Lyme disease is treated easily with antibiotics in the early stages, but can spread to the heart, joints, and nervous system if left untreated.
- 4.11 **Chiggers**
- 4.11.1 Chiggers are mite larvae, approximately ½ mm in size, and typically invisible to the naked eye. While chiggers are not known to carry infectious diseases, their bites and resulting rashes and itching can lead to dermatitis and a secondary infection.
- 4.11.2 Chiggers are typically active from the last hard freeze in the winter or spring to the first hard freeze. They are active all year in the Gulf Coast and tropical areas.
- 4.12 **Spiders**
- 4.12.1 Spiders can be found in derelict buildings, sheltered areas, basements, storage areas, well heads and even on open ground. Spiders can be found year round in sheltered areas and are often present in well heads and valve boxes.
- 4.12.2 Most spider bites produce wounds with localized inflammation and swelling. The Black Widow and Brown Recluse spiders in the US and others outside the US inject a toxin that causes extensive tissue damage and intense pain.
- 4.12.3 Additional information on spider identification can be found in attachment *S3NA-313-WI3 Poisonous Spider Identification*.
- 4.13 **Mosquitoes**
- 4.13.1 Mosquitoes can transmit the West Nile Virus and other forms of encephalitis after becoming infected by feeding on the blood of birds which carry the virus. Positive cases of West Nile Virus have been confirmed throughout North America since 2007.
- 4.13.2 Most people infected with the virus experience no symptoms or they have flu-like symptoms. Sometimes though, the virus can cause severe illness, resulting in hospitalization and even death, so proper precautions should be taken. Consult a medical practitioner if you suspect you have West Nile Virus.
- 4.13.3 When a mosquito bites, it injects an enzyme that breaks down blood capillaries and acts as an anticoagulant. The enzymes induce an immune response in the host that results in itching and local inflammation. The tendency to scratch the bite sites can lead to secondary infections.
- 4.13.4 CDC data indicates that mosquito-borne illnesses, including the strains of encephalitis, are a health risk to employees working in outdoor environments. At least one of the Encephalitis strains listed below is known to exist in every area of the U.S. and in many other countries as well:
- Eastern Equine encephalitis (EEE)
 - Western Equine encephalitis (WEE)
 - West Nile Virus
 - St. Louis encephalitis (SLE)
 - La Crosse (LAC) encephalitis

- 4.13.5 Other diseases including Dengue Fever and Malaria are spread by mosquitoes in the sub-tropic and tropical parts of the world. See *S3NA-313-WI4 Mosquito Borne Diseases* for information on the locations where mosquito borne diseases are known to be present.

4.14 **Bees and Hornets**

- 4.14.1 Bees, hornets, and wasps may be found in derelict buildings, sheltered areas, and even on open ground. The flying/stinging insects are not specifically included in the scope of this procedure and the PPE and other protective measures are not normally effective against aggressive, flying insects. Avoid reaching into areas where visibility is limited.
- 4.14.2 If stung by a wasp or bee or hornet, notify a co-worker or someone who can help should you have an allergic reaction. Stay calm and treat the area with ice or cold water. Seek medical attention if you have any reactions to the sting such as developing a rash, excessive swelling or pain at the site of the bite or sting, or any swelling or numbness beyond the site of the bite or sting.
- 4.14.3 Employees with known allergies to insect stings should consult their personal physician for advice on any immediate medications that they should carry with them. AECOM highly recommends that employees with known allergies inform their co-workers of the allergy and the location of the medications they might carry for the allergy.

4.15 **Poisonous Plants**

- 4.15.1 Poisonous plants including poison ivy, oak and sumac, which contain the oil urushiol that produces a rash, can lead to dermatitis and infections. Exposure to urushiol produces a rash that can be irritating and cause the exposed employee to scratch the affected area, increasing susceptibility for an infection. It should be noted that each time an employee is exposed to urushiol the severity of the reaction increases. In cases that involve severe rashes, medical treatment may be necessary to control the rash.
- 4.15.2 Wild parsnip is found throughout the U.S. and contains a poison that produces a rash similar to poison oak and ivy. Unlike poison oak and ivy, the active oil will not be present on unbroken leaves. See *S3NA-313-WI6 Wild Parsnip Identification* for additional information and photos of wild parsnip.
- 4.15.3 Plants that field staff should recognize and take precautions to avoid include: Poison Sumac, Poison Ivy (terrestrial and climbing), Poison Oak, Giant Hogweed² (or Giant Cow Parsnip), Wild Parsnip, Devil's Club and Stinging Nettle. Many others are extremely poisonous to eat (e.g., Poison Hemlock; Water Parsnip) – do not eat anything that has not been identified.
- 4.15.4 See *S3NA-313-WI5 Plants of Concern* for information on locations where some of these poisonous plants are found in the US.
- 4.15.5 Of the toxic plants in the cashew family, Poison Ivy (*Rhus radicans*) is most widespread occurring across southern Canada. It is usually a low sprawling shrub or ground cover but in southwestern Ontario it also grows as a thick woody vine that grows high into the tree canopy. Poison Oak (*Rhus diversiloba*) is a low shrub that grows only in southwestern British Columbia and Poison Sumac (*Rhus vernix*) is a tall shrub that grows in southern Ontario but is quite rare. All of these plants possess urushiol oils in nearly all parts of the plant. Touching the plant causes an itchy skin rash that shows up several days following contact. People have a wide range of reactions which in severe cases can lead to oozing blisters on large parts of the body. Some people apparently never react and others may develop an allergy after no reaction after years of frequent contact.
- 4.15.6 Several plants in the carrot family contain toxic sap that causes severe dermatitis if it comes into contact with skin that is then exposed to sunlight. The most serious reaction is caused by the Giant Hogweed (*Heracleum mantegazzianum*), a garden that is spreading in southern Ontario and is also present in southwestern British Columbia. The plant is enormous, attaining up to 5 m in height, which it does in one growing season. Contact causes painful blistering that can cause permanent disfigurement. It is to be avoided. Similar but less serious reactions can be caused by Meadow Parsnip (*Pastinaca sativa*) and Cow Parsnip (*Heracleum lanatum*). Meadow Parsnip can be very abundant on disturbed sites.
- 4.15.7 Nettles, particularly Stinging Nettle (*Urtica dioica*) and Wood Nettle (*Laportea canadensis*) contain urticating hairs on the leaves and stems that cause sharp pain or itchiness on contact with skin. The irritation is immediate and normally lasts no more than an hour and there are no lasting consequences.

² *Phytophotodermatitis* producer: keep skin covered and wash well after exposure

- 4.15.8 Some plants contain abundant stiff spines that can present a safety hazard, particularly if one is to fall into them. Fragile Prickly Pear cactus (*Opuntia fragilis*) is common in semi arid areas of the southern Prairie Provinces and interior British Columbia. Pieces will break off and imbed into one's ankle by scarcely brushing them. Devils Club (*Oplopanax horridum*) can form dominant understorey in humid forests among the western mountains. It contains semi-soft spines on the stems that will break off in the skin causing considerable irritation for days. In some areas of Ontario, Prickly-ash (*Zanthoxylon americanum*) a tall shrub with sturdy spines, sometimes forms dense single stands that are nearly impenetrable.
- 4.15.9 A large number of plants are not harmful to touch but may contain poisonous berries or foliage that could cause serious complications or death if they are ingested. It goes without saying not to eat any berries or plants if you are not absolutely sure of their identity.
- 4.15.10 Of all the plants, Giant Hogweed presents the most serious health risk. Field staff should learn to recognize and avoid it if encountered.
- 4.15.11 Employees who develop a rash as a result of exposure to poisonous plants shall report the exposure immediately to their **Supervisor** or **Project Manager** who will then forward the report to the **Regional SH&E Manager**.
- 4.16 **Additional Biological Hazards**
- 4.16.1 Additional Work Instructions are provided for protection and prevention from the following:
- S3NA-313-WI11 Large Carnivores
 - S3NA-313-WI12 Bear Safety
 - S3NA-313-WI13 Small Mammals
 - S3NA-313-WI14 Snakes
 - S3NA-313-WI15 Alligators
- 4.17 **Habitat Avoidance, Elimination, and/or Control**
- 4.17.1 Ticks, Spiders and Insects
- The most effective method to manage worker safety and health is to eliminate, avoid and/or control hazards. Clearing the project site of brush, high grass and foliage reduces the potential for exposure to biological hazards. Clearing will not eliminate the exposure to flying insects and there might be an increased exposure to ticks, spiders, and poisonous plants during the clearing process.
 - AECOM projects such as subsurface environmental assessment or remediation are often candidates for brush and overgrown grass to be cleared. In these instances, the AECOM **project manager** shall either request that the client eliminate vegetation, or request approval from the client to have vegetation clearing added to the scope of work.
 - When projects must be conducted in areas that cannot or may not be cleared of foliage, personal precautions and protective measures outlined in this SOP shall be prescribed.
 - Mosquitoes breed in stagnant water and typically only travel a quarter mile from their breeding site. Whenever possible, stagnant water should be drained to eliminate breeding areas. **Project Managers** and client site managers should be contacted to determine whether water can be drained and the most appropriate method for draining containers, containment areas, and other objects of standing water.
 - If water cannot be drained, products similar to Mosquito Dunks® can be placed in the water to control mosquitoes. Once wet, the Mosquito Dunks® kill the immature, aquatic stage of the mosquito. The active ingredient is a beneficial organism that is lethal to mosquito larvae, but harmless to fish, humans, and other animals. Mosquito Dunks® provide long-term protection for 30 days or more.
- 4.17.2 Poisonous Plants
- If poisonous plants are identified in the work area, **employees** will mark the plants using either flags or marking paint, and discuss what the specific indicator will be to signal to other **employees** to avoid the designated area. If **employees** decide to use ground-marking paint to identify poisonous plants, they should discuss this tactic with the **Project Manager** and/or Client to gain approval.

- If removal of the plants is considered, it should be subcontracted to a professional landscaping service that is capable and experienced in removing the plant. If herbicides are considered for use, a discussion will need to occur with the **Project Manager** and Client to determine whether it is acceptable to apply herbicides at the work site. Application of herbicides may require a license.
- AECOM **employees** shall not attempt to physically remove poisonous plants from the work area unless a clearing procedure including PPE is prepared in advance and approved by the **Region SH&E Manager**. If a SWP or HASP is prepared for the project, the clearing procedure should be included and the required PPE specified.

4.17.3 Bird Droppings

- Bird excrement may be encountered due to the nesting of pigeons and other birds and winged animals (e.g., bats) on or in structures. Substantial accumulations of droppings can pose physical and health risks as slippery surfaces (if wet) and if the material is disturbed and becomes airborne, it can be inhaled or ingested if personal hygiene practices are not implemented. Inhalation of airborne droppings can cause diseases such as histoplasmosis. Exposure to surfaces with bird droppings shall be safeguarded by implementing proper work practices, training employees for awareness and using PPE. See *S3NA-313-W110 Bird Droppings Safe Work Practices*.

4.18 Personal Precautions and Personal Protective Measures

4.18.1 Precautions

- Be aware of the potential irritants in your area and know how to recognize them.
- Modify activities to avoid encounters (diurnal rhythms, seasonal rhythms).
- Wear protective clothing.
- When working in areas where there may be small insects that “hitchhike” (e.g., ticks, spiders, scorpions), it is recommended that clothes are turned inside out and shaken at the end of day; do not wear same clothes two days in a row.
- Staff should always be aware of where they are placing their hands, or where they are sitting in order to avoid contact with potential toxins.

4.18.2 PPE

- The following recommendations may be considered by the project team to determine if the use of PPE is necessary for the type of work planned: Disposable gloves may be cotton, leather, or synthetic materials and must not be reused after removing.
- Clearing activities present the greatest risk of employee exposure but reduce the risks once completed. Recommendation – AECOM employees actively participating in clearing will use full protection from ticks and insects during the clearing activities including insect repellents, Tyvek® coveralls, and gloves.
- If the foliage being cleared includes poisonous plants, exposed skin will be treated with a dermal barrier cream such as Tecnu®’s Oak ‘n Ivy Armor or Enviroderm’s Ivy Block and either a full face respirator or a half face respirator (with goggles) fitted with a P-100 (HEPA) dust filter.
- Work in habitats with direct exposure to ticks, mosquitoes, and poisonous plants is likely and the scope of work does not allow for worksite control measures like vegetative clearing: Recommendation – Full protection from biological hazards including insect repellents, Tyvek® coveralls or full length clothing, poisonous plant barrier creams and wipes, and gloves.
- Work in habitats with direct exposure to ticks and mosquitoes and no exposure to poisonous plants is likely and the scope of work typically does allow for worksite control measures like vegetative clearing: Recommendation – Protection including insect repellents and Tyvek® coveralls or full length clothing.
- Work in habitats with direct exposure to poisonous plants and no exposure to ticks or insects is likely and the scope of work does not allow for worksite control measures like vegetative clearing: Recommendation – Full protection from poisonous plants including insect repellents, Tyvek® coveralls or full length clothing, poisonous plant barrier creams and wipes, and gloves.
- Industrial/Commercial/Office Facilities – Direct contact with biological hazards is considered unlikely or low risk: Recommendation – PPE for biological hazards are not required; however, Tyvek coveralls and insect repellent should be available if exposure to spiders, flying insects, or other biological hazards is encountered.
- Work in areas where no biological hazards are expected because of the local environment, winter weather, or property development: Recommendation – PPE for biological hazards is not required;

however, Tyvek® coveralls and insect repellent should be available if exposures to spiders, flying insects, or other biological hazards are encountered.

- The following precautions and protective measures shall be implemented by AECOM **employees** conducting field work where the biological hazards covered by this SOP exist:

4.18.3 Insects, Spiders, and Ticks

- Chemically-treated field clothing, full-length clothing, or Tyvek® coveralls.
- Application of insect repellent to clothing and/or exposed skin.
- Routine personal checks.
- Exercise care when collecting samples and avoid reaching into areas where visibility is limited. If stung by an insect or bitten by a spider or tick, attempt to identify the attacker and notify a co-worker or someone who can help should the bite site become painful, discolored, or swollen. Stay calm and treat the area with ice or cold water. Seek medical attention if you have any reactions to the sting such as developing a rash, excessive swelling or pain at the site of the bite, or any swelling or numbness beyond the site of the bite.
- Oil of lemon eucalyptus, DEET, and Permethrin have been recommended by the Centers for Disease Control and Prevention for effective protection against mosquitoes that may carry the West Nile virus and related diseases.
- Note that DEET will reduce the effectiveness of Fire Resistance Clothing (FRC) and should not be applied to this clothing. If working in FRC, **employees** can apply DEET to their skin and let dry prior to putting FRC on, or use Permethrin as it has been shown not to reduce the effectiveness of FRC. Permethrin will need to be applied to FRC well in advance of the planned work.

4.18.4 Poisonous Plants

- **Employees** working in areas where poisonous plants exist shall wear either long sleeve clothing or Tyvek® coveralls, and disposable cotton, leather or synthetic gloves. **Employees** must not touch exposed skin (neck and face) with potentially contaminated gloves. Tyvek® and gloves worn to protect from exposure to poisonous plants will be treated as contaminated, removed from the body in a manner that the contamination is not spread, and placed in plastic bags for disposal.
- Personal clothing that has been exposed to poisonous plants shall be decontaminated with a poisonous plant cleanser such as Tecnu® or removed in a careful manner, bagged and washed separately from other clothing to remove urushiol.
- Work boots will be decontaminated with either soap and water or a cleansing agent such as Tecnu® cleanser.
- Remember that in the fall and winter the hazard still exists in the form of stubble and roots.
- Employees who develop a rash as a result of exposure to poisonous plants shall report the exposure immediately to their **Supervisor** or **Project Manager** who will forward the report to the RSHEM.
- For dermatitis caused by Poison Ivy, Poison Oak, or Poison Sumac, calamine lotion is effective.

4.19 Selection and Configuration of Field Clothing

4.19.1 At a minimum, **employees** will wear long legged pants and long sleeve shirts or Tyvek® coveralls to reduce the amount of exposed skin when biological hazards are identified at the work site. Gloves will also be worn consistent with the recommendations of the site-specific SWP, HASP and/or THA to minimize hand exposure.

4.19.2 Where ticks, chiggers, and spiders are presumed to exist, the Tyvek® or chemically-treated clothing will be taped to the work boots.

4.19.3 See *S3NA-313-WI7 Configuration Clothing for Protection* against ticks and insects for illustrations and instructions for configuring, taping, and tucking clothing.

4.19.4 Chemical Treatment of Field Clothing

- Oil of lemon eucalyptus, DEET, and Permethrin have been recommended by the Centers for Disease Control and Prevention for effective protection against mosquitoes that may carry the West Nile virus and related diseases.
- Note that DEET will reduce the effectiveness of Fire Resistance Clothing (FRC) and should not be applied to this clothing. If working in FRC, **employees** can apply DEET to their skin prior to putting FRC on, or use Permethrin as it has been shown not to reduce the effectiveness of FRC. Permethrin will need to be applied to FRC well in advance of the planned work.

4.19.5 Permethrin

- When selected as part of a project's PPE requirements, the AECOM **Project Manager** shall ensure that field teams wear clothing treated with the chemical Permethrin, which is an insecticide with repellent properties registered with the U.S. Environmental Protection Agency (EPA), and recommended by the CDC. Information regarding the toxicity and product safety of Permethrin is provided in *S3NA-313-W18 Insect Repellent Active Ingredient Product Information*. Permethrin is highly effective in preventing tick bites when applied to clothing, but is not effective when applied directly to the skin. Two options are available for Permethrin treatment of clothing worn during field work: 1) pre-treatment of fabric by the clothing manufacturer; or 2) employee treatment of their personal clothing using 0.5% Permethrin spray. AECOM strongly recommends the first option (employees obtaining pre-treated clothing) to avoid the time required, potential risk, and housekeeping issues involved with manually treating the clothing with spray. Purchase pre-treated clothing in accordance with *S3NA-208-PR Personal Protective Equipment Program* and with the approval of your **Supervisor**. For more information visit the AECOM NA SH&E website.
- The Permethrin pre-treatment is odorless and retains its effectiveness for approximately 25 washings. After 25 washings, the pre-treated clothing will be considered no longer effective and removed from service. Clothing that has been manually treated by employees will be considered effective for 5 wash cycles.
- Also, use of clothing that has been pre-treated with Permethrin offers a reduction in the use and application of other insect repellents that must be applied directly to the skin.. Costs for clothing shall be charged to projects as a consumable item. If charging to the project is not possible, the charges should be managed as a department expense. **Supervisor** or **Department Manager** approval is required prior to purchase.
- If an employee opts not to utilize chemically pre-treated clothing while potentially exposed to insects, spiders and/or ticks, they must either: 1) wear Tyvek® coveralls taped to the boots, 2) full length clothing consisting of long legged pants and long sleeved shirts treated with an insect repellent containing Permethrin, DEET, or an organic alternative to their work clothing.

4.19.6 Manual Treatment of Field Clothing

- If clothing pre-treated with Permethrin is not available or not purchased prior to field work, employees may manually treat their clothing with Permethrin spray. The outer surfaces of all external clothing to be worn during field work should be treated with 0.5% Permethrin spray a minimum of 2 to 4 hours prior to field work (boots, trousers, shirt, jackets, rain gear; refer to Section 4.16 for selection of field clothing) in accordance with recommendations provided by the New York State Department of Health presented in *S3NA-313-W19 New York Department of Health Recommendations for Permethrin Application*. This will likely require treatment at home or the office prior to field mobilization. Caution should be used when applying Permethrin as it is highly toxic to fish and house cats. Clothing treatment will last for approximately 5 wash cycles (check the specific instructions for the product used.)

4.19.7 Lemon Eucalyptus

- Lemon Eucalyptus is a plant-based insect repellent on the market as Repel Lemon Eucalyptus. The products have been proven to be effective against mosquitoes, deer ticks, and no-see-ums for up to six hours. Derived from Oil of Lemon Eucalyptus, this non-greasy lotion or spray has a pleasant scent and is not known to be toxic to humans. The spray or lotions will be effective for approximately two to six hours and should be reapplied every two hours to sustain protection. Lemon Eucalyptus products cannot be applied to fire retardant clothing.

4.19.8 Purchase of PPE and Repellents and Lotions

- Costs for clothing, repellents, lotions, and other PPE shall be charged to projects as a consumable item. If charging to the project is not possible, the charges should be managed as a department expense. **Supervisor** or **Department Manager** approval is required prior to purchase.
- Material Safety Data Sheets (MSDS) for the repellents, lotions, and cleansers discussed in this Procedure are not required because the repellents, lotion, and clothing are consumer products used in the manner intended for the general public. Although not required, a MSDS should be obtained for the products used and placed into the office MSDS library and site-specific health and safety plans. Selected MSDSs are available on the AECOM NA SH&E web site.

4.20 Personal Hygiene and Body Checks

- 4.20.1 Tick-borne diseases typically require that the tick be imbedded for four hours to begin disease transfer. The oils from poisonous plants can take up to 4 hours after exposure to penetrate the skin and react with the live proteins under the skin.
- 4.20.2 It is recommended that exposed skin be checked frequently for the presence of ticks, insects, rashes, or discolorations. External clothing should also be checked for the presence of ticks and insects; these should be retained for identification and to determine if medical treatment is needed.
- 4.20.3 **Employees** will shower as soon as practical after working in the field and examine their bodies for the presence of ticks, insect bites, rashes, or swollen areas. If imbedded ticks are found, they should be removed using the technique described in *S3NA-313-WI2 Ticks*, the tick should be preserved with the date and location of the bite noted, and retained for identification if medical treatment is needed as described in Section 4.13.1 of this Procedure.
- 4.20.4 The presence of an imbedded tick, rash, or abnormal reactions will be reported as an SH&E Incident to the **Project Manager** or **Supervisor** who will forward the report to the **RSHEM** for follow up.

S3NA-313-FM Tick Test Request Form

IGeneX, Inc.
795 San Antonio Road
Palo Alto, CA 94303
800/832-3200
www.igenex.com

TICK TEST REQUEST FORM

Revised: JUNE 2008

TO SEND A TICK:

- Place ticks (up to 20) in a small tube or plastic baggy with a small piece of moist cotton.
 - Place container in a sealed plastic bag.
 - Fill out lower portion of this form.
 - Place form, check and sealed plastic bag in padded envelope or box.
 - Send to IGeneX, Inc. and mark front of envelope or box with "TT".
 - IGeneX does not "TYPE" or determine the species of the ticks. If you want to "TYPE" your tick, please contact your local Vector Control Center.
 - Once your tick(s) have been processed, the tick can not be returned to you.
 - For Multiple Ticks: up to 20 ticks will be tested together at one time unless indicated otherwise.
- If ticks are tested separately, the charge is per tick. Please test my ticks separately. Yes ☐

Please test the tick by PCR for:

<input type="checkbox"/>	Test 140	Lyme Disease (<i>B. burgdorferi</i>)	\$65.00
<input type="checkbox"/>	Test 689	Babesiosis (<i>B. microti</i> and/or <i>B. duncani</i>)	\$65.00
<input type="checkbox"/>	Test 148	Ehrlichiosis (<i>Ehrlichia</i>)	\$65.00
<input type="checkbox"/>	Test 290	<i>Bartonella henselae</i>	\$65.00
<input type="checkbox"/>	Test 975	<i>Rickettsia</i>	\$65.00

Name and Address of Sender:

If you would like results faxed or called, please indicate below. Otherwise, results will be mailed by USPS.

_____ Please fax my completed results to:
() -

Phone: () _____

_____ Please call me with my results at:
() -

☐ Check enclosed payable to IGeneX, Inc.

☐ Please charge my credit card for the above tests:

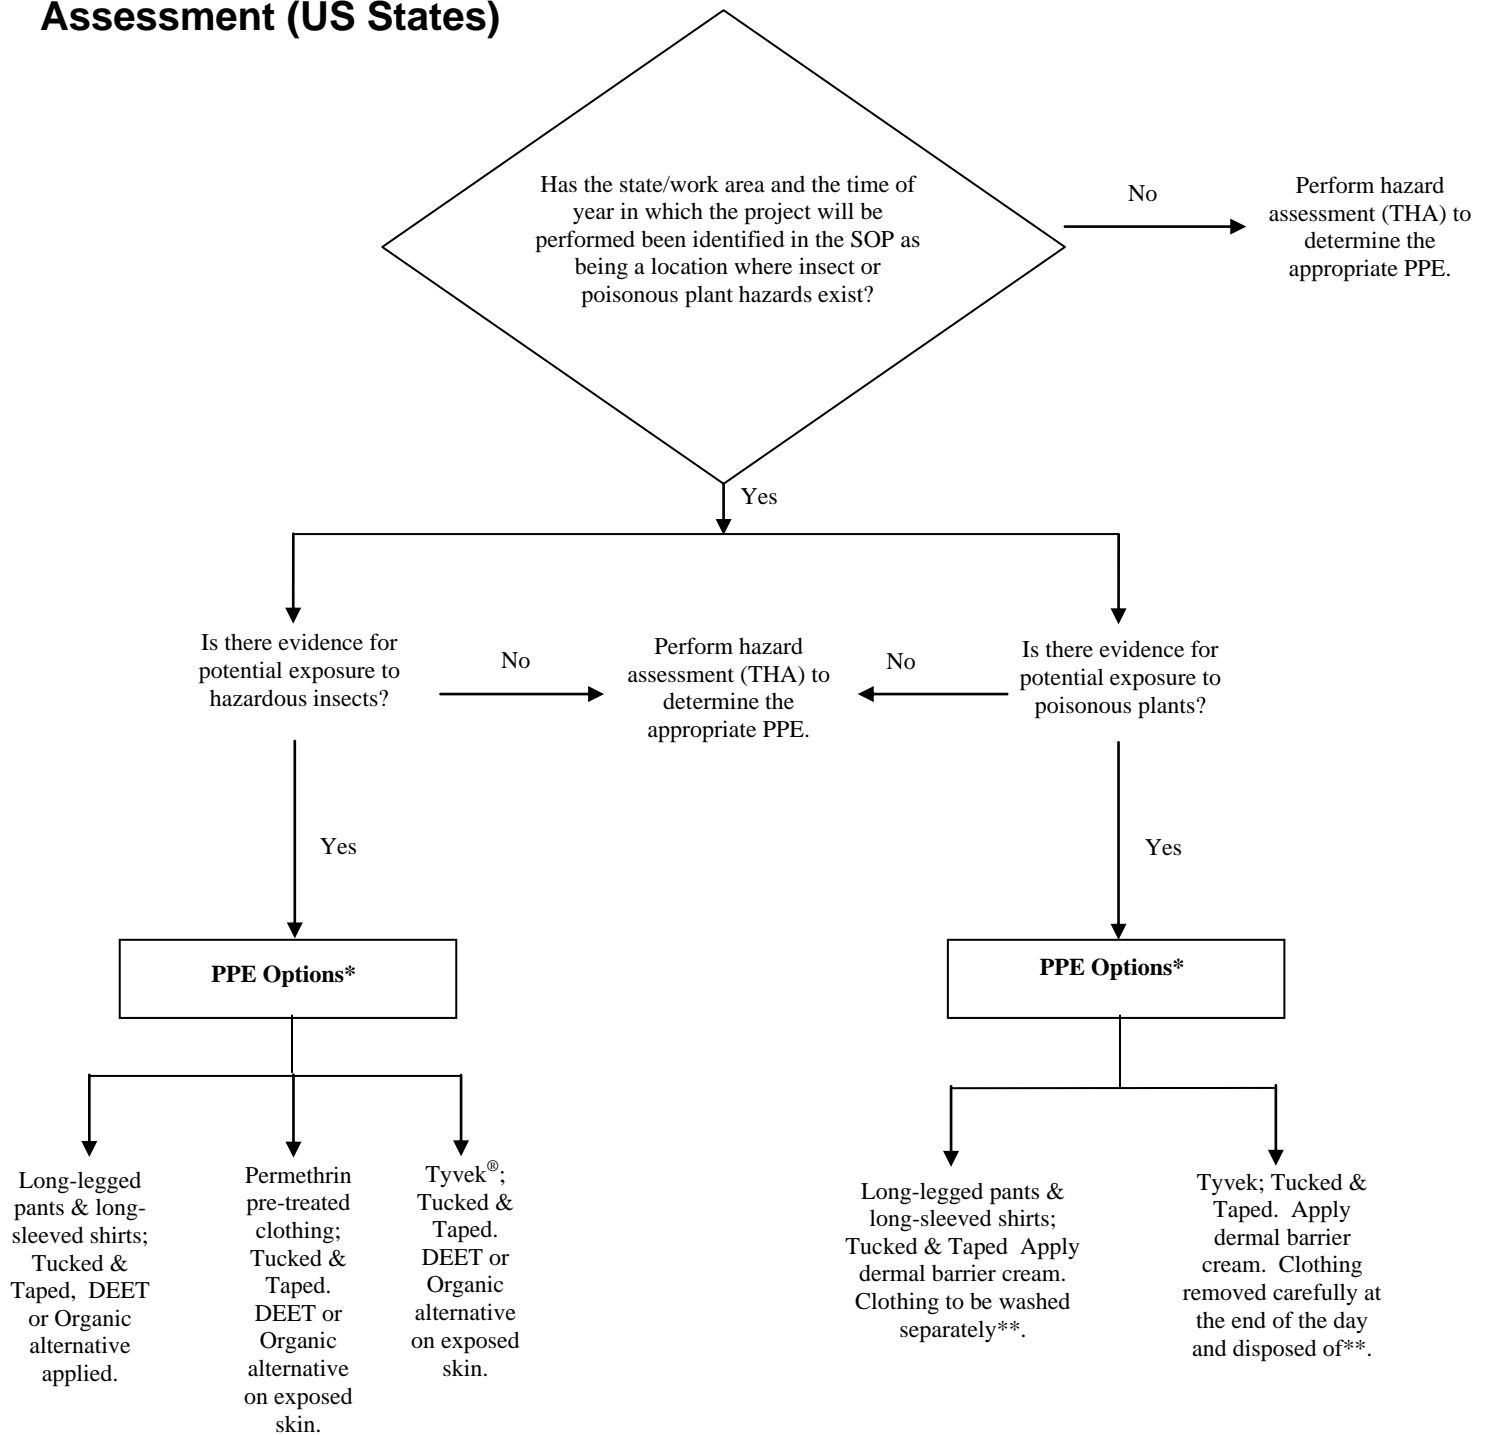

☐ Visa ☐ Mastercard ☐ Discover

Signature _____

S3NA-313-WI1 Biological Hazard Assessment Decision Flow Chart Hazard Assessment (US States)

* indicates that when both insect and poisonous plant hazards are recognized hazards at a project site, the most conservative combination of the available PPE choices will be selected.

** indicates that clothing that has been known or suspected to have come in contact with poisonous plants must be washed before it can be worn again. Similarly, Tyvek® that has been known or suspected to have come in contact with poisonous plants will be disposed of rather than reused during a subsequent day or project.

State by State Guideline for Exposure

States	Tick-Borne Diseases	Mosquito-Borne Diseases	Poisonous Plants
Alabama	Year Round Low Risk	Year Round	Year round
Alaska	No Risk	No Risk	No Risk
Arizona	No Risk	March - July	March - November
Arkansas	March - November	March - November	March - November
California	Low Risk	March - November	Year Round
Colorado	Low Risk	March - November	No Risk
Connecticut	March - November	Low Risk March - November	March - November

S3NA-313-WI2 Ticks

1.0 Background

- 1.1 The Public Health Agency of Canada (PHAC) works with the provinces, health authorities and other experts on research to define and monitor the occurrence of the ticks that carry *Borrelia burgdorferi*, the bacterium that causes Lyme disease. In Canada, the blacklegged tick (*Ixodes scapularis*; often referred to as a deer tick) and the western blacklegged tick (*Ixodes pacificus*) are the species known to transmit this disease-causing agent, as well as other less common agents.
- 1.2 In Quebec, blacklegged tick populations are becoming established in parts of the Monteregie and Estrie regions in the southeast of the province. In Ontario, populations can be found in Long Point; Point Pelee National Park; Rondeau Provincial Park; Turkey Point; Prince Edward Point National Wildlife Area and St. Lawrence Islands National Park in the Thousand Islands region of eastern Ontario. In Nova Scotia, blacklegged tick populations are found in the Lunenburg, Bedford and Shelburne areas. An established population has also been found in the southeastern corner of Manitoba. Western blacklegged ticks, on the other hand, are found in British Columbia; they are fairly widely distributed but populations are largest in the lower mainland, on Vancouver Island, and in the Fraser Valley.
- 1.3 Although the distribution of blacklegged ticks in Canada appears to be limited, surveillance indicates that some of the established populations are spreading within certain areas of southern Canada. The potential expansion of localized tick populations makes it difficult to precisely define the geographic limits of any given population; however, people living in or visiting areas adjacent to established tick populations may have a greater chance of contact with blacklegged ticks. Although current evidence does not suggest a widespread distribution of blacklegged tick populations in Canada, the establishment of new populations appears to be an ongoing process. Hence, it is desirable to continue surveillance and to take precautions to reduce tick contact.
- 1.4 The rate of infection of ticks with the bacterium that causes Lyme disease varies. Infection rates are typically higher in adult ticks compared to the other stages (nymphs and larvae). Despite the lower rates of infection, people are most likely to acquire Lyme disease from a nymph because this stage is so small (see Figure 2) and thus more likely to go unnoticed and feed for a sufficient amount of time for the Lyme disease bacterium to be transmitted (24-36 hours). Infection rates are often greater in tick populations that have been established for long periods of time (such as Long Point) compared to newly established ones. As many as 60 percent of the adult ticks at Long Point are infected; however, infection rates in adults are more often between 10 and 25 percent at the other localities where ticks are established. Partly because of differences in the types of hosts that they feed upon, infection rates of the Lyme disease agent in *Ixodes pacificus* are much lower (1-3 percent) than *Ixodes scapularis*.
- 1.5 While there is a higher risk of coming in contact with infected blacklegged ticks in areas where populations are established, there is also a low risk of Lyme disease being contracted almost anywhere in Canada because migratory birds transport infected ticks over large geographic distances. Surveillance data indicates that about 12 percent of the ticks detected outside of areas where tick populations are established, and likely transported there on migratory birds, are infected with the agent of Lyme disease.
- 1.6 Source: <http://www.phac-aspc.gc.ca/id-mi/tickinfo-eng.php>

Figure 1**Reported Cases of Lyme Disease by Month of Illness Onset United States, 1992-2004**

Lyme disease patients are most likely to have illness onset in June, July, or August and less likely to have illness onset from December through March.

Lyme disease likelihood = April through November http://www.cdc.gov/ncidod/dvbid/lyme/ld_rptmthofill.htm

2.0 Tick removal tips from CDC

<http://www.cdc.gov/ncidod/dvrd/ehrlichia/Q&A/Q&A.htm>

3.0 To Remove Attached Ticks

- 3.1 Use fine-tipped tweezers or notched tick extractor, and protect your fingers with a tissue, paper towel, or latex gloves (see figure). Persons should avoid removing ticks with bare hands.
- 3.2 Grasp the tick as close to the skin surface as possible and pull upward with steady, even pressure. Do not twist or jerk the tick; this may cause the mouthparts to break off and remain in the skin. (If this happens, remove mouthparts with tweezers. Consult your health care provider if illness occurs.)
- 3.3 After removing the tick, thoroughly disinfect the bite site and wash your hands with soap and water.
- 3.4 Do not squeeze, crush, or puncture the body of the tick because its fluids may contain infectious organisms. Skin accidentally exposed to tick fluids can be disinfected with iodine scrub, rubbing alcohol, or water containing detergents.
- 3.5 Save the tick for identification in case you become ill. This may help your doctor make an accurate diagnosis of potential diseases by determining what type of tick it is. Place the tick in a sealable plastic bag and put it in your freezer. Write the date of the bite on a piece of paper with a pencil and place it in the bag.

4.0 Devices Designed for Removing Ticks

- 4.1 **The Tick Tool** - <http://www.ticktool.com/index.html>

5.0 Folklore Remedies Don't Work

- 5.1 Folklore remedies, such as the use of petroleum jelly or hot matches, do little to encourage a tick to detach from skin. In fact, they may make matters worse by irritating the tick and stimulating it to release additional saliva or regurgitate gut contents, increasing the chances of transmitting the pathogen. These methods of tick removal should be avoided.

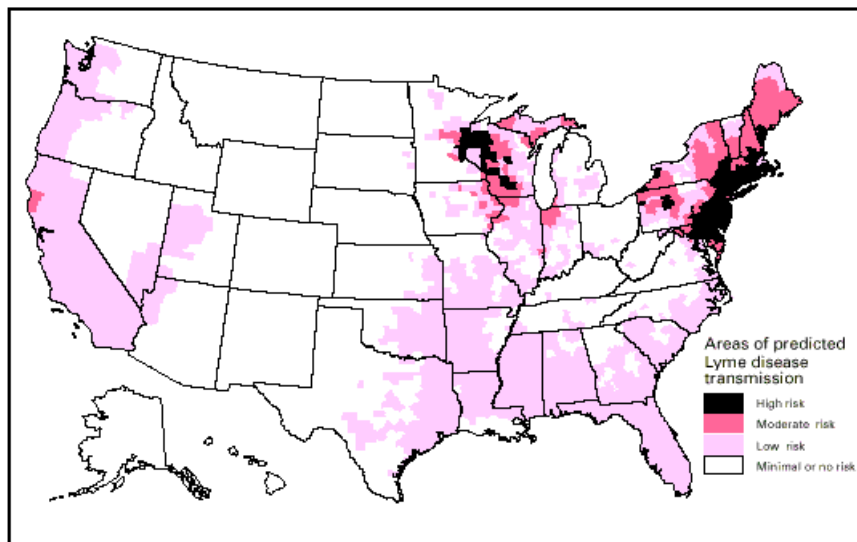

**Information Regarding Common Tick-Borne Diseases and
Tick Removal Procedures**

**Table 1
Common Tick-Borne Diseases in the U.S. and Information Resources**

Disease	Tick Species	CDC Informational Web Pages

S3NA-313-WI3 Poisonous Spider Identification

Black Widow Spider

- Abdomen usually shows hourglass marking.
- The female is 3-4 centimeters in diameter.
- Have been found in well casings and flush-mount covers.
- Not aggressive, but more likely to bite if guarding eggs.
- Light, local swelling and reddening of the bite are early signs of a bite, followed by intense muscular pain, rigidity of the abdomen and legs, difficulty breathing, and nausea.
- If bitten, see physician as soon as possible.

Brown Spiders (Recluse)

- Central and South U.S., although in some other areas, as well.
- ¼-to-½-inch-long body and the size of silver dollar.
- Hides in decaying wood, baseboards, ceilings, cracks, and undisturbed piles of material.
- Bite either may go unnoticed or may be followed by a severe localized reaction, including scabbing, necrosis of affected tissue, and very slow healing.
- If bitten, see physician as soon as possible.

Exercise care when collecting samples and avoid reaching into areas where visibility is limited. If bitten by a spider, attempt to identify the spider, notify a co-worker or someone who can help should the bite site become painful, discolored, or swollen. Stay calm and treat the area with ice or cold water. Seek medical attention if you have any reactions to the sting such as developing a rash, excessive swelling or pain at the site of the bite or any swelling or numbness beyond the site of the bite.

Additional USA Spider Identification charts are available at <http://www.termite.com/spider-identification.html>

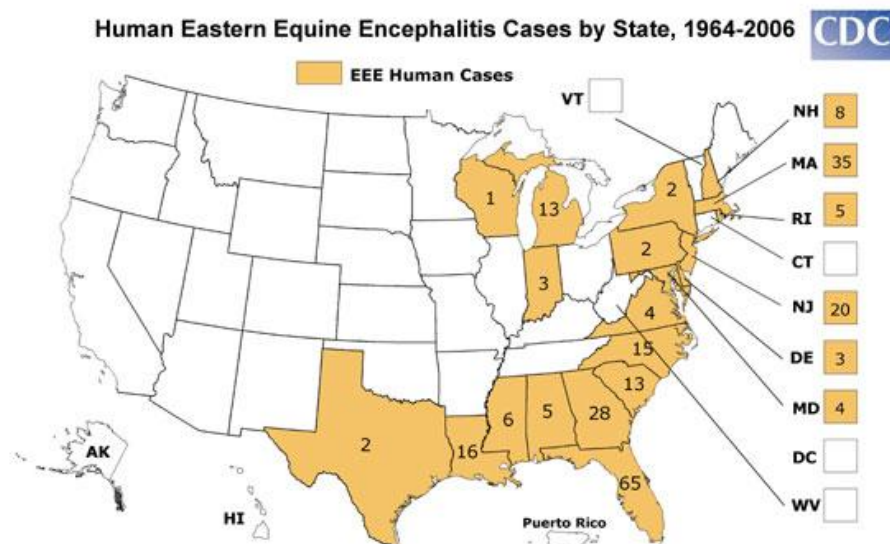

S3NA-313-WI4 Mosquito-Borne Diseases

1.0 Background

- 1.1 CDC data indicates that mosquito-borne illnesses, including encephalitis, are a health risk to employees working in outdoor environments.
- 1.2 Mosquitoes pose a risk of causing infection with various forms of encephalitis and other diseases in AECOM employees. This section will focus on the transmission of encephalitis. West Nile encephalitis is an infection of the brain that is caused by a virus known as the West Nile virus.
- 1.3 If other mosquito-borne diseases are identified in the project area, the local Public Health Department and CDC should be consulted to determine what diseases are present and exposure prevention recommendation.
- 1.4 According to the CDC, arboviral encephalitis is a virus that is “maintained in nature through biological transmission between susceptible vertebrate hosts by blood feeding arthropods”, e.g., mosquitoes. It exists in various forms in global distribution, and in four primary forms in the U.S.: 1) eastern equine encephalitis (EEE), 2) western equine encephalitis (WEE), 3) St. Louis encephalitis (SLE), and 4) La Crosse (LAC) encephalitis; all of which are transmitted by mosquitoes.
- 1.5 Mosquitoes are known to breed in standing water; therefore, when standing water is found at a job site, actions should be taken to drain the water. Typically, mosquitoes will fly only a quarter of a mile (400 meters) from their breeding location.

S3NA-313-WI5 Plants of Concern

1.0 Background

- 1.1 Poison ivy, oak and sumac (poisonous plants) pose a significant threat to AECOM employees due to the dermatitis that results from exposure to the oil on these plants, called urushiol.
- 1.2 Exposure to urushiol produces a rash that can be irritating and cause the exposed employee to scratch the infected area, increasing susceptibility for an infection to result from the rash.
- 1.3 It should be noted that each time an employee is exposed to urushiol, it increases the severity of the reaction they will have in subsequent exposures.

2.0 Treatment

- | | |
|-----|--|
| 2.1 | In cases that involve severe rashes, medical treatment may be necessary to control the rash. |
| 2.2 | Employees that develop a rash as a result of exposure to poison ivy, oak or sumac should report the exposure immediately to their Supervisor, Project Manager and RSHEM. |

Figure 1
Distribution Map for Poison Ivy

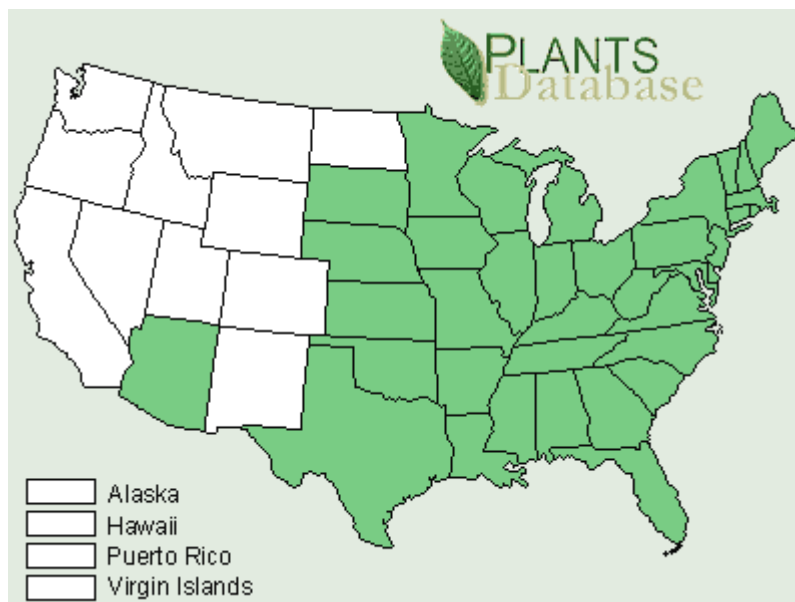

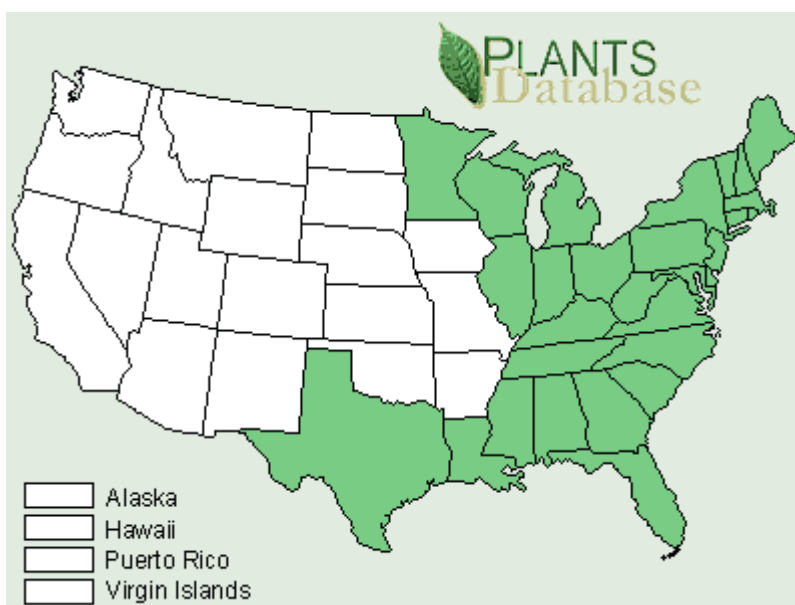

Figure 2
Distribution Map for Poison Oak

S3NA-313-WI6 Wild Parsnip Identification

1.0 Background

- 1.1 Wild Parsnip (also known as Poison Parsnip) looks similar to a large carrot plant and is found in open places along roadsides and in waste places throughout the United States and Canada.
- 1.2 This plant produces a compound that causes severe blistering and discoloration after being exposed to sunlight—a condition known as photodermatitis. That is, when the skin comes in contact with this plant's juice and then is exposed to UV light, a severe burn develops.

2.0 Hazard

- 2.1 Everyone can get burned by wild parsnip. Unlike poison ivy, you don't need to be sensitized by a prior exposure. However, wild parsnip is only dangerous when the juice from broken leaves or stems gets on your skin—therefore, you can touch and brush against the undamaged plant without any danger.
- 2.2 If one gets some of the sap of Hogweed (or Meadow Parsnip or Cow Parsnip) in contact with skin, it is critical that they stay out of the sun for 8 hours. If one needs to remove the plant they should be completely covered with overalls, gloves, hat and safety glasses.

More information can be found at www.co.becker.mn.us/dept/soil_water/wild_parsnip.aspx

S3NA-313-WI7 Configuration Clothing for Protection Against Ticks and Insects

1.0 Configuration of Clothing

- 1.1 Loose-cuff trousers must be tucked into socks, wrapped with duct tape (or equivalent) completely around the cuff of the sock up on to the surface of the pant leg to prevent entry of insects between the sock and pants, and preferably reverse-wrapped with “sticky” side out (see figure below).

S3NA-313-WI8 Insect Repellent Active Ingredient Product Information

1.0 Application of Insect Repellent

- 1.1 Immediately prior to the commencement of work in the field, an AECOM-approved insect repellent shall be applied to exposed skin, and to the outer surface of pant leg cuffs tucked into socks, shirt tails tucked into pants at the waist, and shirt cuffs.
- 1.2 Table 1 provides a list of AECOM-approved insect repellent active ingredients; employees may utilize any brand containing the minimum concentration of active ingredients as listed.
- 1.3 All products are registered with the EPA and recommended by the CDC.
- 1.4 Employees should select the AECOM approved repellent which is best for them based on skin sensitivity/allergies, and personal preference, but be aware that reapplication frequency will be greater for Picaridin and lemon eucalyptus products.
- 1.5 Employees shall carefully read and comply with manufacturer recommendations and instructions on product labels prior to application. Repellent shall not be applied beneath clothing to minimize the potential for irritation and/or allergic reaction.
- 1.6 The chemical N,N-diethyl-*m*-toluamide (DEET) shall not be applied to Nomex™ fire retardant clothing as it reduces the effectiveness of the fabric.

Table 1
Approved Insect Repellents

Active ingredient and minimum concentration	Products Available	Approximate Duration of Effectiveness	Notes and Web Link to Product Safety Information
Permethrin (0.5%)	-Repel® Permanone -Coulston's Duranon™	2 weeks ¹	-Application to clothing and equipment only
DEET (23.8%)	-Deep Woods Off!® -Repel® Sportsmen Formula®	5 hours ²	-Cannot be applied to Nomex™ fabric
Picaridin (7%)	-Cutter Advanced™	4 hours ³	-Protection equivalent to approximately 10% DEET
Oil of Lemon Eucalyptus (30%)	-Repel® Lemon Eucalyptus	2 hours ²	-Protection equivalent to approximately 7% DEET -Natural, plant based product

¹ – New York State Department of Health, 2007

² – Fradin and Day, 2002

³ – Spectrum Brands, 2007

- 1.7 Repellent shall be reapplied multiple times daily over the course of the day at a frequency identified during the hazard assessment based on manufacturers' recommendations, the approximate effective period provided in Table 1, and other factors such as perspiration, precipitation, etc.
- 1.8 All approved repellents are available at most department or sporting goods stores.

S3NA-313-WI9 New York Department of Health Recommendations for Permethrin Application

1.0 Application Recommendations

- 1.1 Source: New York State Department of Health, 2007. Health Advisory, Tick and Insect Repellents. <http://www.health.state.ny.us/nysdoh/westnile/pdf/2737.pdf>
- 1.2 Products containing permethrin are for use on clothing only—not on skin. Permethrin kills ticks and insects that come in contact with treated clothes. It is effective for two weeks or more if the clothing is not laundered.

2.0 Treat Clothing Only– DO NOT APPLY TO SKIN.

- 2.1 Read carefully and follow manufacturer's recommendations for application.
- 2.2 If you accidentally get the product on your skin, immediately wash with soap and water.
- 2.3 Apply to clothing in a well-ventilated outdoor area, protected from wind.
- 2.4 Only spray Permethrin products on the outer surface of clothing and shoes before you put them on - do not apply to clothing while it is being worn. Only spray enough product to lightly moisten the outer surface of the fabric causing a slight color change or darkening; do not saturate clothing. Do not exceed recommended spraying times. Pay special attention while treating socks, trouser cuffs and shirt cuffs to ensure proper coverage. Hang the treated clothing outdoors and allow clothing to dry for at least two hours (four hours under humid conditions) before wearing.
- 2.5 Do not treat clothing more than once every two weeks. Launder treated clothing separately from other clothing at least once before retreating.
- 2.6 Keep treated clothes in a separate bag. Those who frequent tick or mosquito habitats should consider having a set of clothes, preferably long-sleeved shirt, pants and socks that are used only in such settings. These clothes can be treated with a Permethrin-containing product according to the label directions, worn only when needed, and then placed in a separate bag when not in use. In hot weather, when long-sleeved shirt and pants may be uncomfortable, pants and jackets made of insect netting (either untreated or treated with repellent) can be worn. Such clothes are available in some sporting good stores and through outdoor equipment catalogs.

- 1. U. S. Environmental Protection Agency. 1999. Office of Pesticide Programs List of Chemicals Evaluated for Carcinogenic Potential-August 25, 1999. Office of Pesticide Programs. Washington, DC.

S3NA-313-WI10 Bird Droppings Safe Work Practices

1.0 Background

- 1.1 According to the National Institute for Occupational Safety and Health (NIOSH), histoplasmosis is an infectious disease caused by inhaling spores of a fungus called *Histoplasma capsulatum* (abbreviated *H. capsulatum*) that may inhabit accumulated masses of pigeon droppings and excrement of other birds and flying animals. Its symptoms vary greatly, but the disease primarily affects the lungs. Occasionally, other organs are affected. This form of the disease is called disseminated histoplasmosis, and it can be fatal if untreated. The acute respiratory disease form of histoplasmosis is characterized by respiratory symptoms, a general ill feeling, fever, chest pains, and a dry or non-productive cough. Distinct patterns may be seen on a chest x-ray. Chronic lung disease resembles tuberculosis and can worsen over months or years. If symptoms occur, they may start within 3 to 17 days of exposure, with an average of 10 days. On a positive note, histoplasmosis is not contagious.
- 1.2 Psittacosis, although primarily a respiratory disease, can cause a wide variety of clinical manifestations. Generally, about 10 days after infection occurs, the clinical illness begins abruptly with fever, chills, weakness, fatigue, muscle pain, anorexia, nausea, vomiting, excessive sweating and difficulty with breathing, headache, backache, and sensitivity to light.
- 1.3 Hypersensitivity pneumonitis is also known as pigeon breeder's disease.

2.0 Symptoms

- 2.1 The acute form of hypersensitivity pneumonitis is clinically characterized by chills, fever, cough, breathlessness without wheezing, and malaise 4-10 hours after exposure. In general, an acute attack subsides after 18 to 24 hours.

3.0 Treatment

- 3.1 If a person should develop any of the symptoms as noted above, or others, it is important to see a physician and inform him of an exposure to pigeon/bird or bat excrement. A failure to diagnose the preceding conditions could occur if a treating physician is unaware of a patient's exposure to pigeon/bird or bat excrement.

4.0 Prevention

- 4.1 Prior to work in any area where pigeons or other flying animals may nest, a written statement from the client shall be obtained in regards to the potential for, and extent of, accumulation of excrement on/in the structure from pigeons and other winged animals.
- 4.2 The client shall be asked to provide appropriate details as to the basis for their statement (e.g., date of last visual survey for pigeon/bird or bat excrement accumulation, date of last excrement removal effort, etc.).
- 4.3 In no case will an AECOM employee or contract employee be permitted to commence structure inspection procedures without project management having received and evaluated the aforementioned written statement from the client.
- 4.4 According to NIOSH, the best way to prevent exposure to *H. capsulatum* spores during survey and inspection work is to avoid situations where excrement and other potentially-contaminated material can become airborne and inhaled. Therefore, it is preferable that the efforts to determine if, and to what extent, there is an accumulation of pigeon/bird or bat excrement on/in structures, or the efforts to clean-up/removal/disposal of such contaminated material, be left to the client or subcontracted out.

5.0 Safe Work Practices

- 5.1 In those cases where AECOM employees or contract employees are contracted by the client to determine the extent of accumulation of animal excrement in/on structures, the following minimum safety and health precautions shall be taken. (NOTE: precautionary measures are based on

recommendations and best practices prescribed in the NIOSH 2004 public document titled *Histoplasmosis – Protecting Workers at Risk*).

- 5.2 All workers shall wear disposable protective clothing (Tyvek® coveralls). Disposable overalls with hoods shall be donned when working in areas where *H. capsulatum* spore-contaminated material is likely to fall from overhead.
- 5.3 All workers shall wear disposable shoe coverings fitted with ridged soles made of slip-resistant material to reduce the likelihood of slipping on wet or dusty surfaces. Gloves shall be worn.
- 5.4 All workers shall wear a full facepiece air purifying respirator fitted with P100 (HEPA) cartridges. If entering an enclosed area in which the extent of excrement contamination is unknown, additional protective measures shall be taken such that workers shall wear a powered air-purifying respirator (APR) with full facepiece fitted with P100 (HEPA) cartridges. Any variance from these requirements must be approved by the Regional SH&E Manager. Workers donning APRs shall be medically screened, cleared, and trained in their proper use in accordance with AECOM safety program standards.
- 5.5 If contaminated material must be disturbed for purposes of removal/disposal or during the structure inspect process, it shall be wetted down prior to all work and will be rewetted as necessary to minimize airborne dusting.
- 5.6 After working in *H. capsulatum* spore-contaminated areas and before removing any respiratory protective equipment, workers shall remove all protective clothing and shoe coverings and seal them in a heavy-duty plastic bag for disposal.
- 5.7 Workers shall observe a high degree of personal hygiene, even if the exposure is casual. Special care shall be taken to wash hands, face, and other areas of exposed skin thoroughly before eating, drinking or smoking.

S3NA-313-WI11 Large Carnivores

1.0 Hazard

- 1.1 Most wild carnivores in the feline family (cougars, lynx, and bobcat) or the canine family (wolves and coyotes) are more predictable than bears and are not predatory towards humans; however, all wild animals can be dangerous if they feel threatened or if they are sick or starving.
- 1.2 Most ungulates (deer, moose, elk, and caribou) will avoid humans and will flee as soon as a human is sighted; however, females with young (during May and June) and males during the mating season (September to November) can be very aggressive, especially if provoked.

2.0 Personal Protective Equipment

- 2.1 Noise makers such as bear bangers, whistles and bells can be used as deterrents for an approaching animal.
- 2.2 Pepper (bear) spray can be used to ward off an imminent attack.

3.0 Safe Work Practice

- 3.1 Most negative encounters with ungulates or carnivores can be avoided with a few key preventative measures:
 - 3.1.1 When working in wilderness isolation, always travel in pairs and make lots of noise.
 - 3.1.2 Always store food in air-tight containers away from sleeping areas (if camping) and never carry strong smelling foods which could attract animals.
 - 3.1.3 Keep your eyes open for fresh animal signs which may indicate a dangerous situation:
 - Extensive fresh rubbing on branches in the fall might indicate the presence of a rutting male ungulate that may become aggressive to defend a potential mate.
 - A fresh kill or carcass which might indicate the presence of a carnivore that may become aggressive to defend its food.
- 3.2 Maintaining a distance of at least 30 metres (100 feet) allows large animals an escape route. If you notice any signs of aggression or behavioral changes, you should move away to a safe location. Wildlife should not be enticed by reaching out or simulating calls.
- 3.3 Pets should be kept secure and away from wildlife as their actions can provoke an attack. Moose, deer and other wildlife may appear quite docile; however, if a dog makes them feel threatened, their behavior can become unpredictable.

3.4 If you are approached by a carnivore (wolf, coyote, or cougar):

- 3.4.1 Pick up small children immediately.
- 3.4.2 Try to appear bigger, hold your arms or an object over your head.
- 3.4.3 Face the animal and retreat slowly. Do not run or play dead.
- 3.4.4 Maintain steady eye contact with the animal.
- 3.4.5 If the animal continues to approach, deter an attack by yelling, waving a stick or throwing rocks.
- 3.4.6 If you are attacked, fight back. Hit the animal with a heavy stick or rock.

3.5 If you are approached by an ungulate (moose, elk, deer, bison or caribou):

- 3.5.1 An angry moose, elk or deer will face you with its head and ears lowered.
- 3.5.2 Back away slowly.
- 3.5.3 Look for something to get behind like a tree or a car. You can go faster around an obstacle than the ungulate can.

- 3.5.4 An ungulate is more likely to bluff charge but if it continues the charge and you are attacked in the open, curl up in a ball on the ground. Always protect your head with your arms and lie still.
- 3.5.5 Stay still after the attack until the ungulate moves away.

S3NA-313-WI12 Bear Safety

1.0 Hazard

- 1.1 An encounter with a bear of any species can have a wide variety of outcomes, ranging from a simple sighting, to a false charge, to a serious mauling or even death. Consequently, the risk of a bear encounter must be taken very seriously.
- 1.2 The hazard or risk associated with a bear encounter varies significantly depending on the location. It is important to research the project area before field work commences to determine the expected probability of encountering a bear. Remoteness from urbanized areas should not be a criterion, as bears have been encountered within city limits, especially near landfills.
- 1.3 The risk associated with a bear encounter also varies with the species of bear, the season, and the circumstances under which the bear is encountered.
- 1.4 Preparing staff for any type of encounter is key to managing the risk.

2.0 Personal Protective Equipment

- 2.1 The best deterrent of a “bad bear encounter” is knowledge: a good understanding of the ecology and the behavior of the bears that will likely be encountered.
- 2.2 **Bear Spray and Bear Bangers**
 - 2.2.1 Staff must have hands-on training for the safe use of bear spray (a pre-season practice run is a good use of expired bear spray).
 - 2.2.2 Prior to work commencing, staff must ensure that the bear spray they are carrying is still valid and not past its expiration date.
 - 2.2.3 During travel, bear spray must be sealed in an airtight container or bag and must not travel in the cab of a vehicle, aircraft, or helicopter.
- 2.3 **Firearms**
 - 2.3.1 Environments and conditions which pose a high risk of bear encounters, may warrant the use of an armed wildlife monitor. Project managers, in consultation with appropriate project staff and SH&E Management, are responsible for determining the level of risk for their projects and whether or not such measures are required.
 - 2.3.2 A person hired as an armed bear monitor must be properly trained in wildlife monitoring as well as certified in the expert usage of firearms.
 - 2.3.3 The usage of an armed bear monitor is intended only as an additional precautionary measure to be used in specific environments to ensure the protection of field staff; staff should still be equipped and trained appropriately for the risk.

3.0 Restrictions

- 3.1 Staff must not work alone in areas where there is a medium or high risk of a bear encounter.
- 3.2 Generally, AECOM personnel shall not carry a firearm and attempt to function as a wildlife monitor and/or perform their professional duties. This can only be over-ridden with expressed permission of Regional Management.

4.0 Training

- 4.1 In-house Bear Awareness training must be undertaken by all field staff who work in bear country every three years at a minimum, or more often as required.
- 4.2 The Bear Awareness training involves testing and improving the employee’s knowledge about bear encounters, watching videos regarding bear awareness and behavior, and participating in group discussions about how to avoid and how to respond to bear encounters.
- 4.3 Specific considerations are given to black bear, grizzly bear, and polar bear encounters.

5.0 Safe Work Practice

5.1 Staff must be aware of wildlife signs and avoid wildlife encounters.

5.2 Bear Sign

- 5.2.1 **Fresh tracks:** It is often better to see the bear's tracks than to see the actual bear. If you can tell the direction that the bear is travelling in, it is prudent to change your course of direction. Bears will travel down the same pathways as people or other large animals use. If you have a clear track you can determine which type of bear has passed through the area. If you see more than one track, you can tell that it is possibly a female with cubs. Avoid females with cubs!
- 5.2.2 **Scat:** Bear scat will look different depending upon the bear's diet. Close examination of bear scat can sometimes give you an indication of what the bears have been eating at that time of year. If the scat contains remnants of human garbage, there is a human food conditioned bear in the area. These bears associate people with food and can be the most dangerous type of bear to encounter.
- 5.2.3 **Animal carcasses:** IF YOU COME ACROSS A CARCASS, LEAVE THE AREA IMMEDIATELY. Grizzly bears will often cover their kills for a few days and let it rot, then come back and eat it. THE BEAR WILL STAY CLOSE BY. Grizzly bears will defend their kill and this is a situation that could prompt a defensive attack by a bear.
- 5.2.4 **Torn-Up Logs and Stumps:** Bears will forage for insects in dead logs and rotting trees. You will often see torn up logs and stumps, evidence of their foraging.
- 5.2.5 **Evidence of Digging:** Holes dug into the ground are often made by grizzly bears digging for roots or ground squirrels. In particular Grizzlies will dig for food in the early spring soon after they leave their dens.
- 5.2.6 **Claw Marks on Trees:** Claw marks can be left on trees by black bears when they have climbed up a tree. Grizzly bears will also leave claw marks on trees and on the ground. Bears will often chew a small tree or a sign-post, so watch for signs of chew marks along the trail.
- 5.2.7 **Hair on Trees:** Bears will rub against trees, usually trees with rough bark, to scratch themselves. You can find evidence of bears by the hair left in the tree's bark. The higher the hair left on the tree, the bigger the bear. Remember that the bear will often stand on its back legs to scratch its back on the tree.
- 5.2.8 **Daybeds:** Bears will be most active in the early morning and in the evening. It would be prudent for field staff to restrict their field activities during the bear's most active foraging times as much as possible. During the heat of the day, bears will rest in daybeds. These can be shallow depressions of piled up leaves in the forest, trampled vegetation, a shallow scrape or a hole. Daybeds are usually located in cool places. Bears will make daybeds along streams and rivers. Daybeds are often associated with feeding places and therefore should be avoided.

5.3 Prevention

- 5.3.1 Your best defense against bears is to actively practice bear avoidance techniques when working in the field. You can prevent chance encounters by taking the following precautions:
- Know the areas and habitats bears use at different times of the year, and attempt to avoid such areas or be extremely cautious if you have to travel through them.
 - Contact the local Fish & Wildlife Office to get current information on the bears in the area. Ask what other camps are in the area and if they are following good bear avoidance practices. (i.e., do they keep a clean camp?) If there are nearby human food sources available, e.g., an open dumpsite, the local bears may not be afraid to approach your camp.
 - Always be aware of your surroundings. Stay alert. Watch for signs of bears along your route.
 - Use binoculars to look around for bears when you are in open terrain.
 - Never approach a bear if you see one feeding in the distance.
 - Note the behavior of other wildlife in the area. Flocks of ravens can alert you to a possible animal carcass, and perhaps a bear. The area should be avoided. Bird or squirrel alarm calls might be telling you that a bear is near.
 - Whenever possible, travel in daylight and try to avoid areas with restricted visibility. (dense brush)

- Make lots of noise, especially when travelling in dense vegetation. Sing, shout, or talk loudly. You can carry portable air horns or cans of rocks. (Please note that bear bells are not effective – they do not make enough noise to warn a bear that you are approaching. You need to be loud so the bear can hear you coming!) Remember that the noise you make can be masked by loud natural sounds such as the wind or water. Therefore it is possible that the noise you make can go unnoticed by a bear whose attention is focused on feeding. You must make every attempt not to surprise a bear. In areas of loud natural noise, be louder!
- Stay together and travel in groups. Bears are less likely to attack groups of people. When travelling in groups, stay close together. Being in a group doesn't help if the individuals have spread apart along the trail!
- Pets should not accompany you when you are travelling in bear country. If you must take your pet, keep the animal on a short leash at all times. Unleashed dogs will harass bears and once scared, run back to their owner with an angry bear in pursuit.
- Do not wear perfumes or cosmetic products when you are travelling in bear country. Do not mask your human scent.
- Women should use internal sanitary protection, (i.e. tampons) when menstruating and burn all used sanitary products after usage. Keep all used sanitary supplies in sealed bags until you have a chance to burn.
- Children should be kept very close by in bear country.
- Carry bear deterrents and know their limitations. Be familiar with how to use the deterrents, how to transport the deterrent safely and under what conditions it is most effective. Carry the deterrent in a belt, out in front and ready to grab at a moment's notice, never in your backpack.

5.4 **Field Workers: Precautions in Bear Country**

- 5.4.1 Field workers should take extra precautions when working in bear country.
- 5.4.2 Make every effort to go out into the field with another person; you should not be working alone in the field. One person can act as a lookout for the other. Keep watch for bear signs.
- 5.4.3 Never approach a bear.
- 5.4.4 Report where you are going and when you will return every time you leave camp. Have a plan of action if someone does not report back to camp at a specified time.
- 5.4.5 Bears do get used to a camp's schedule and you will have fewer surprise encounters if everyone in the camp comes and goes at the same time every day.
- 5.4.6 Take a two-way radio with you when you go out into the field.
- 5.4.7 Always carry bear deterrents with you in the field and understand each deterrent's limitations. Carry your deterrents on a belt, out in front and ready to use instantly. Do not carry your deterrents in your backpack.
- 5.4.8 Keep any food that you take with you sealed in odor-proof/bear proof containers. Make every attempt to take odorless food with you, not something with a heavy scent.
- 5.4.9 Pack out any garbage in odor-proof containers and burn once you return to camp.
- 5.4.10 The noise of an ATV or skidoo can scare off a bear. Starting the machine and revving it up can scare off a curious bear. **DO NOT CHASE A BEAR WITH AN ATV OR SKIDOO.** You may need to drive the ATV around in circles to scare off the bear, but do not chase the bear.
- 5.4.11 Take extra precautions when travelling along lakes or stream beds; bears use streams and river beds as travel routes. Be sure to carry noise makers.
- 5.4.12 Limit your workday so you are not out in the early morning or evening when bears are most likely to be foraging.
- 5.4.13 All Field Workers should be proficient in First Aid. Do not go out into the field without first aid training.
- 5.4.14 All Field Camps should have a First Aid Kit.
- 5.4.15 All Field Camps should have means of communication with local ambulance or Air-ambulance personnel.
- 5.4.16 A person's best defense against bears is to avoid them. If this is not possible, then being heard, smelled, or seen may lessen your chances of surprising a bear and/or provoking an attack.

- 5.4.17 All wildlife should be respected, avoided, and not harassed at any time.
- 5.4.18 Cooking in remote areas should be avoided. Any food should be stored in airtight containers and all garbage should be managed appropriately: “pack it in, pack it out”.
- 5.4.19 A bear in camp or within human structures is not a chance encounter. If this bear challenges you, you must fight, scream, and do whatever is necessary to live, no matter what species the bear is!
- 5.4.20 In general, there are two types of bear encounters: Defensive and Non-defensive for grizzly bears and black bears. Your response will vary based on your assessment of the situation (your training will help you in identifying these situations and the appropriate response).

6.0 Encounters

6.1 General Recommendations When Encountering a Bear

- 6.1.1 Consider your surroundings and assess the situation before you act.
- 6.1.2 Remain calm. Do not turn your back to a bear.
- 6.1.3 DO NOT RUN – You will trigger the bear’s natural response to chase you. Bears are extremely fast and you cannot outrun a bear. (They are as fast as an Olympic sprinter, so if you are not faster than an Olympic sprinter, don’t run! They can run 40 km/hr and you can’t!) You cannot outswim a bear either.

6.2 Bear Encounters in the Field

- 6.2.1 Your response will depend upon the type of encounter.
- 6.2.2 There are several different encounters listed.
- 6.2.3 Bears are more predictable than once believed and you can determine your best course of action in a confrontation by understanding the bear’s characteristics and motivation. There are two pieces of information you should be aware of in any bear encounter:
- The type of bear you are dealing with; and
 - The reason for the encounter.
- 6.2.4 Some people believe that when you stand your ground against a predatory black bear attack, the bear will feel threatened and leave. This has been effective in some cases. HOWEVER, it is not effective against a grizzly bear predatory attack and it is very difficult to know when it will be effective against black bears. Polar bears do not follow the same behavioral patterns as grizzly and black bears, they are almost always aggressive and will not back down. Special considerations must be given to projects where polar bear encounters are anticipated.
- 6.3 **If you can leave undetected:**
- 6.3.1 Leave the area quietly in the same direction that you came from.
- 6.3.2 Move while the bear’s head is down. Stop moving when the bear lifts its head to check its surroundings.
- 6.3.3 Stay downwind so the bear will not pick up your scent.
- 6.3.4 When you have moved a safe distance away, you can either watch and wait until the bear leaves or make a wide detour around the bear.
- 6.3.5 If the bear is unaware of you and approaching: Allow the bear the right of way.
- 6.4 **If you cannot leave undetected:**
- 6.4.1 Let the bear know that you are present by smell first; therefore move upwind so they can pick up your scent.
- 6.4.2 If it is possible, try to keep the bear in your sight. Watch to see if the bear leaves when it smells that a person is nearby.
- 6.4.3 Attempt to move out of the way without being noticed by the bear. If you cannot do this, talk loudly to let the bear know where you are.

6.5 If the bear is aware of you but in the distance:

- 6.5.1 Remain calm.
- 6.5.2 Continue walking slowly in the same general direction, but head away from the bear.
- 6.5.3 DO NOT RUN. The bear can quickly outrun you if it is so inclined.
- 6.5.4 If the bear begins to follow you, drop your pack or some article, (not food) to distract the bear. This may distract the bear long enough for you to escape. If you drop food for the bear – you will help the bear associate food with humans and teach it that aggressive behaviour will be rewarded with food.
- 6.5.5 If it is a grizzly following you, climb a tree if there is a large tree around. Although grizzlies can climb trees, they are often not motivated enough to try. Very large grizzlies are not able to climb trees well. If grizzlies climb, they can go 3 to 4 meters. Grizzlies will try and push trees over so do not climb a small tree.

6.6 If the bear is aware of you and close:

- 6.6.1 A bear will feel threatened in a close confrontation. The bear's natural tendency will be to reduce or to remove the threat. Assist the bear by acting as non-threatening as possible.
- 6.6.2 Do not make direct eye contact with the bear.
- 6.6.3 Do not make any sudden moves.
- 6.6.4 Do not run!
- 6.6.5 The bear needs to identify you as a person, so talk in low tones and slowly wave your arms over your head.
- 6.6.6 Attempt to give the bear an opportunity to leave. Be sure the bear has an open escape route. Do not corner a wild animal.
- 6.6.7 Try to back away slowly and/or climb a tree if appropriate.
- 6.6.8 Attempt to deter the bear if you are in a safe position.

6.7 If the bear is close and threatening:

- 6.7.1 If you have a deterrent such as a bear banger or bear spray, be prepared to use it depending on how close the bear is. Try to scare the bear off.
- 6.7.2 If you do not have a deterrent, or if using the deterrent is not successful, act as non-threatening as possible.
- 6.7.3 Talk to the bear in a calm authoritative tone of voice.
- 6.7.4 Do not startle or provoke the bear by making sudden moves.
- 6.7.5 Never imitate the bear's aggressive sounds, signals or posture. The bear is attempting to establish dominance and imitating its moves is a challenge to its dominance.
- 6.7.6 Back slowly away from the bear and drop a pack or some other article in order to distract the bear momentarily.
- 6.7.7 Remember that the bear may be defending cubs that you have not yet seen or they have a food cache nearby. Attempt to look as non-threatening as possible.

6.8 If the bear is very close and approaching:

- 6.8.1 A distance of less than 50 meters in an open area and closer in a forested area.
- 6.8.2 If the bear continues to approach, use your deterrent.
- 6.8.3 If the bear does not respond to the deterrent you must now STAND YOUR GROUND!
- 6.8.4 If the bear continues to approach and is acting aggressive, YOU MAY HAVE TO SHOOT if you are carrying a firearm.

6.9 If the Bear Charges!

- 6.9.1 A bear will charge you at high speed down on all four legs and often crouched low to the ground.
- 6.9.2 Bears do not charge when standing up on its hind legs.

- 6.9.3 Many charges are bluffs and the bear will often stop or veer off just at the last minute. It is difficult to know if the bear is bluff charging or not until it gets very close.
- 6.9.4 When faced with a charging bear you have two options:
- Use your bear deterrent; or
 - Roll into a ball and cover your neck and head with your arms if you are unarmed and have no other choice.
- 6.10 **Playing Dead:**
- 6.10.1 Note: Playing dead is a very controversial topic among seasoned field personnel. Some will tell you to never play dead in any situation, others will swear that it is the only thing you should do. Playing dead is a personal choice that you will have to make.
- 6.10.2 If you play dead it is possible that you can prevent serious injuries if a chance encounter with a bear results in an attack. Playing dead may reduce the threat that you represent to the bear.
- 6.10.3 If you decide to play dead, it is important to protect your vital areas. The older information that is still found online states that the person should roll into a ball to protect their vital organs. This has been replaced and you are now advised to lie in the prone position. Lie flat on your stomach and lace your fingers behind your neck (to protect it), Spread your legs apart to provide stability if the bear tries to turn you over. Stay in this position. If the bear manages to roll you over, immediately roll back onto your stomach to protect your face, neck and vital areas. Do not try to resist or struggle as this will intensify or prolong the attack. Once the attack is over, DO NOT MOVE until the bear has left the area. Look around and be very sure that the bear is gone before moving. (If the bear is a female with cubs, she will leave and move her cubs to safety.) If the bear covers you with leaves and vegetation, it probably thinks you are dead. Grizzly's will often cover their prey with vegetation and leave the carcass to ripen for a few days.
- 6.10.4 It is important to note that if the bear attack is prolonged or if the bear begins to eat you, the attack has changed from what you may have first believed to be a defensive attack, to a predatory attack. Fight back in a predatory attack. Concentrate your efforts on the face, eyes and nose of the bear.

S3NA-313-WI13 Small Mammals

1.0 Hazard

- 1.1 Working in the field either directly or indirectly with small mammals has inherent risks of injury or exposure to zoonotic diseases (infectious diseases that can be transmitted from animals to humans) that all field staff need to protect themselves against.
- 1.2 The risks are usually higher when there is direct contact with a wild animal, either through a break in the skin (blood), saliva, or excrement; however, there are also risks through air-borne diseases (e.g., Hantavirus).
- 1.3 Obviously, wildlife biologists directly handling wildlife, dead or alive, or working with wildlife feces or in enclosed habitats (such as caves), have an increased risk of exposure to a wider range of zoonotic diseases and should take extra precautions.

2.0 Personal Protective Equipment

- 2.1 Full-length clothing (long sleeves and pants).
- 2.2 Insect repellent.
- 2.3 Respiratory equipment (when directly handling wildlife).
- 2.4 Gloves (when directly handling wildlife).

3.0 Restrictions

- 3.1 Wildlife handling must only be completed under direct supervision of an experienced individual.

4.0 Training

- 4.1 Any staff that will be handling wildlife must be adequately trained and/or supervised by a wildlife biologist experienced in the job task.

5.0 Safe Work Practice

- 5.1 Wild animals can carry a variety of diseases that humans can contract: viral, parasitic, bacterial, and protozoal. Basic PPE such as full-length clothing, gloves and a respiratory mask will greatly reduce the risk of exposure.
- 5.2 Whenever a wild animal must be handled, the procedure must be accomplished as safely and quickly as possible.
- 5.3 Proper techniques must be employed to avoid or minimize the risk of personal injury while, at the same time, avoiding or minimizing injury to the animal.
- 5.4 Gloves, catch sticks, caging, and other appropriate equipment may be necessary when handling a wild animal. Most of these animals will be extremely stressed, resisting every restraint attempt.
- 5.5 In the unfortunate circumstance that a person is bitten or scratched, he or she should cleanse the wound thoroughly with soap and flush with water immediately, providing for a mechanical removal of potentially infective organisms. This should be followed by cleansing under medical supervision and consultation with a physician to consider the potential exposure to the rabies virus.

6.0 Rabies

- 6.1 You will not be able to accurately determine if an animal has rabies simply by observation as traditional symptoms of rabies (foaming at the mouth, biting, etc.) do not occur in all animals nor at all stages. There are some mammals that are at a higher risk than others for the rabies virus, such as raccoons, skunks, stray cats and dogs, foxes, coyotes, rodents. and bats; however, any mammal can contract the virus.

- 6.2 Rabies is contracted by contact of an infected animal's saliva with an open wound – a bite or a scratch.
- 6.3 Symptoms of rabies in humans usually do not present themselves for a minimum of 10 days to a year or longer (the average is 30 to 50 days). Symptoms are typical of a flu, including malaise, loss of appetite, fatigue, headache, and fever. Over half of all patients have pain (sometimes itching) or numbness at the site of exposure. They may complain of insomnia or depression. Two to 10 days later, signs of nervous system damage appear; hyperactivity and hypersensitivity, disorientation, hallucinations, seizures, and paralysis.
- 6.4 Because rabies is so difficult to detect and positively identify, it is very important to consult a physician immediately. If rabies is a possibility, begin treatment with the rabies vaccine as soon as possible (unlike other vaccines, rabies vaccination begins after exposure because the virus takes a comparatively long time to induce disease).

7.0 Hantavirus

- 7.1 Rodents can carry a variety of diseases; of notable concern is the North American hantavirus which can cause Hantavirus Pulmonary Syndrome (HPS).
- 7.2 A common host of the hantavirus is deer mouse and related species (*Peromyscus spp.*), which are common throughout much of North America.
- 7.3 Although infection is rare, it can be fatal and; therefore, it is necessary that risk of exposure be minimized. Infection can be spread to humans when they:
 - 7.3.1 Breathe air contaminated by deer mouse saliva, urine or feces containing infectious hantaviruses; or
 - 7.3.2 Accidentally rub eyes, mouth or broken skin with hantavirus-infected deer mouse saliva, urine or feces.
- 7.4 The following precautions will be taken for all field operations:
 - 7.4.1 Limit exposure to soils handling and use gloves where appropriate.
 - 7.4.2 Wash or sanitize hands often throughout the day and before meals.
 - 7.4.3 Equipment bags, storage areas, and vehicles will be inspected daily for signs of deer mouse infestation.
 - 7.4.4 Rodent-proof storage containers will be used when practical.
 - 7.4.5 Do not enter buildings infested with deer mice without adequate respiratory protection.
 - 7.4.6 Droppings should never be removed by vacuuming or sweeping. Wetting down an area with a mixture of 1:9 household bleach and water solution will reduce risk of airborne exposure.
- 7.5 If flu-like symptoms develop three days to six weeks after exposure to rodents, a doctor should be contacted immediately (mechanical ventilation is the primary method of treatment).

- 8.1 Trapping and Tagging Small Mammals. A RIC Standard for British Columbia. 1993. Dr. Todd Zimmerling.

S3NA-313-WI14 Snakes

1.0 Hazard

- 1.1 **Snakes have the ability to inject venom.** A bite from a venomous snake, which may inject varying degrees of toxic venom, is rarely fatal but should always be considered a medical emergency.

2.0 Personal Protective Equipment

- 2.1 Long pants and shirts.
- 2.2 Heavy gloves if staff will be handling debris or be close to the ground.
- 2.3 Rubber boots, or boots that fully cover the foot (not sandals!) and preferably are at least 10" high.
- 2.4 Snake Chaps that cover at least the shin.
- 2.5 Personal first aid kit.

3.0 Restrictions

- 3.1 Staff must not work alone in areas where the risk of a snake encounter is high.

4.0 Training

- 4.1 Staff must be notified of the hazard before work commences.

5.0 Safe Work Practice

- 5.1 Staff working in areas known to be inhabited by venomous snakes should take extra precautions, be able to identify the local snake species, and understand the best practices for administering first aid.
- 5.2 Most snakes in Canada are non-venomous; and most snake bites are not fatal, only painful. Learning to identify snake species will assist you in responding appropriately to an encounter, and will assist medical professionals in determining if antivenin needs to be administered if anyone is bit.
- 5.3 Most snakes are non-aggressive and will only attack if immediately threatened.
- 5.4 **Prevention**
- 5.4.1 Before venturing out into the wilderness, familiarize yourself with the snakes in your area, both venomous and non-venomous species.
- 5.4.2 Learn which habitats the venomous species in your region are likely to be encountered in, and use caution when in those habitats.
- 5.4.3 Try as much as possible not to take a snake by surprise.
- 5.4.4 Stay on trails where possible, and watch where you place your hands and feet, especially when climbing or stepping over fences, large rocks, and logs, or when collecting firewood. Take care when overturning any objects on the ground when in snake country.
- 5.4.5 If you see a snake, give it as much room as possible. Most snakes have a strike distance that is only half the length of their body.
- 5.4.6 If you get very close to a rattlesnake, hold very still until it calms down and starts to move away. Then slowly move backwards until you are at least one snake-body length away.
- 5.5 **Treatment**
- 5.5.1 Venomous snakebites are rare, and they are rarely fatal to humans. Of the 8,000 snakebite victims in the United States each year, only about 10 to 15 die. In Canada the number of snake bites each year is very small. However, for any snakebite the best course of action is to get medical care as soon as possible.

- 5.5.2 Try to keep the snakebite victim still, as movement helps the venom spread through the body.
- 5.5.3 Keep the injured body part motionless and just below heart level.
- 5.5.4 Keep the victim warm, calm, and at rest, and transport him or her immediately to medical care.
- 5.5.5 Do not allow him to eat or drink anything.
- 5.5.6 If medical care is more than half an hour away, wrap a bandage a few inches above the bite, keeping it loose enough to enable blood flow (you should be able to fit a finger beneath it). Do not cut off blood flow with a tight tourniquet. Leave the bandage in place until reaching medical care.
- 5.5.7 If you have a snakebite kit, wash the bite, and place the kit's suction device over the bite. (Do not suck the poison out with your mouth.) Do not remove the suction device until you reach a medical facility.
- 5.5.8 Identify the snake that caused the bite to determine if it is venomous, and if antivenin needs to be administered. Do not waste time or endanger yourself trying to capture or kill it. Note the shape & color of the snake's head.
- 5.5.9 If you are alone and on foot, start walking slowly toward help, exerting the injured area as little as possible.
- Note that there are several species of snakes that superficially resemble rattlesnakes. Several species, including Bull, Milk, Fox, and Rat Snakes will even rattle their tails when startled.
 - Massasauga Rattlesnake is recognized as a Threatened Species in Ontario and it is an offence to harass, , or destroy the habitat of this species.
 - One scorpion species, the Northern Scorpion (*Paruroctonus boreus*) occurs in semi-arid areas of southern British Columbia, Alberta, and Saskatchewan. It carries a stinger on the end of its tail. The sting is painful but not life threatening unless there is an allergic reaction.

6.0 Species

6.1 Venomous Snakes in Canada

<p>Eastern Massasauga Rattlesnake (<i>Sistrurus catenatus</i>) found around Wainfleet, Windsor, Bruce Peninsula and eastern Georgian Bay in Ontario.</p>	 <p>Eastern Massasauga Rattlesnake picture by Michael Redmer/Courtesy Lincoln Park Zoo</p>
<p>Northern Pacific Rattlesnake (<i>Crotalus viridis</i>) found primarily in Okanagan and Thompson River valleys of southern British Columbia.</p>	 <p>LANCE TANNAHILL 2000</p>

Prairie Rattlesnake (*Crotalus viridis*) found in south eastern Alberta, and south western Saskatchewan.

6.2 Venomous snakes in the U.S.

Rattlesnake (*Crotalus cerastes*) found mostly concentrated in the southwestern United States, they extend north, east and south in diminishing numbers and varieties. Every contiguous state has one or more varieties of rattlesnake.

The rattlesnake is found in many different biomes ranging from along the coast at sea level, the inland prairies and desert areas to the mountains at elevations of more than 10,000 feet.

Species include: Sidewinder, Santa Catalina, Western, Mojave, Red Diamond, Western Diamond, Ridge Nosed, Eastern Diamondback, and Pigmy.

Western Rattlesnake

Eastern Diamondback

Copperhead (*Agkistrodon contortrix*) is the most common venomous snake found in the eastern US. It can be found in the states of Texas, Oklahoma, Kansas, Missouri, Arkansas, Louisiana, Mississippi, Alabama, Georgia, Florida, South Carolina, North Carolina, Tennessee, Kentucky, Virginia, Illinois, Indiana, Ohio, Iowa, Pennsylvania, Maryland, New Jersey, Delaware, New York, Connecticut, and Massachusetts.

Cottonmouths (water moccasins) (*Agkistrodon piscivorus*) found in the eastern United States from Virginia, south through the Florida peninsula and west to Arkansas, eastern and southern Oklahoma, and east and central Texas..

Coral Snake (*Micrurus sp.*) found in the southern range of many temperate US states including North Carolina, Georgia, Alabama, Mississippi, Louisiana, Texas, Arkansas, Kentucky, Arizona, and New Mexico.

Eastern Coral Snake, *Micrurus fulvius*

S3NA-313-WI15 Alligators

1.0 Hazard

- 1.1 Your chance of encountering an alligator is greatest during the animal's courtship and mating season, which takes place from March through September. This is when male alligators become most dominant and aggressive as they try to intimidate rival males and attract females by their show of power. Some males end up having to travel to find a mate. July through September is when mother alligators are guarding nests.
- 1.2 Mating season takes up much of the warmer months - a very popular time in the southeastern USA for outdoor activities - and alligators are solar-powered, so-to-speak. The warmth from the sun fires up their metabolism, giving them renewed energy; and renewed energy means great potential for conflict.

2.0 Encounter

- 2.1 The alligator is naturally wary of humans, and will flee quickly if you get too close to it, or it may utter a very audible and compelling warning hiss. In some cases; however, alligators may charge or attack. Here are some examples of such cases:
 - 2.1.1 An alligator that is accustomed to being fed by humans may not be so shy.
 - 2.1.2 An alligator that is surprised and alarmed by your approach may attack, thinking that it is being attacked itself.
 - 2.1.3 A mother alligator caring for her nest or for live babies. If you see alligator babies, or if you encounter a nest (usually a mound of vegetation mixed with mud), remove yourself to a safe distance, the mother alligator is sure to be close by. If you get close, the mother may sound a very audible and intimidating warning hiss. Such a nest may be difficult to identify for a non-expert, but it is likely the mother will issue you a warning.
 - 2.1.4 Alligator mothers are well-known to be practically fearless when defending their offspring, whether the little ones have hatched or not. A mother alligator was observed leaping, jaws agape, to attack a helicopter as it approached the nest area to land! (The helicopter carried biologists studying alligator nests.)
- 2.2 Also be careful near heavy vegetation in or near the water's edge. This is where an alligator likes to enjoy privacy and peace during the daylight hours. If you trudge through there and surprise it, the outcome may not be positive.
- 2.3 Generally, a good minimum distance to keep between you and an alligator or nest is 15 feet/ 4.6 meters.
- 2.4 When trying to get past an alligator, make sure not to walk between the alligator and the water, because if it's spooked, it's going to run to the water.
- 2.5 If an alligator does approach in a threatening manner, make as much noise and movement as possible. This should show the alligator that he has taken on more than he can handle and he'll back away.

3.0 Alligator Charge

- 3.1 The alligator is not a natural runner. Those short legs obviously don't serve it like a horse's legs do, and the alligator can actually tire out in a relatively short time. When it charges after a human or animal, it is either trying to scare it away or seize it. It has a fast and furious burst of energy which serves it well for stealth hunting -- grabbing prey when it doesn't expect it. Furthermore, the reptile is

opportunistic, which means, quite simply, it doesn't like to work very hard to get its food if it doesn't have to.

- 3.2 In the very rare event you are charged or chased by an alligator, move in as straight a line as possible away from it as fast as you reasonably can. In many cases, the vegetation features of the wild will serve to protect you by slowing the alligator down, like trees, bumps, bushes, etc. -- your comparatively long legs usually make it easier for you to maneuver through the trees and brush than an alligator's short legs do.
- 3.3 Most adult humans can outrun even a fast crocodilian, which has been clocked at a maximum of about 10 mph/17 kilometers per hour (kph), compared to a human speed of 15-17 mph/24-27 kph. But this doesn't matter much; an alligator will often give up the chase because it sees that the runner is moving away too quickly, and realizes that too much effort will be required to continue pursuit.
- 3.4 You may have heard somewhere that the zigzag run (running in a "z" pattern, side-to-side) is a good idea, but this is not only an unnecessary maneuver but probably a very unwise one. Here's why:
 - 3.4.1 Unless you're an Olympic athlete, running zigzag over natural topography increases your risk of tripping and falling over rocks, plants, roots, and the like. And it goes without saying that falling while being pursued by an alligator is not good.
 - 3.4.2 Furthermore, an alligator doesn't have the degree of stereoscopic vision we have. It actually has a small 'blind spot' directly in front of it. Hence, the alligator's vision is most effective in the 'sides' of its field of view. So, running zigzag not only slows your rate of distance from your pursuer, it may clearly indicate to the animal exactly where you are; even this point hardly matters since in many cases the alligator may keep its eyes shut while pursuing so as not to get them hit by twigs, grass stalks and branches in its path.
 - 3.4.3 Finally, an alligator bites very effectively in a side-swiping motion, so if you are trying to run zigzag and are slowed down by plants, rocks, or other obstacles, the backwards flying leg of a running human is an optimal target for side-swiping, chomping jaws (the operative word here is "side").
- 3.5 Simply put, when faced with an attack, move directly away from the alligator as quickly as possible, navigating the terrain as carefully as possible. The zigzag idea will likely not serve you well.

4.0 Alligator Attack

- 4.1 If it seizes prey, and the prey fights back hard, the alligator may release it, depending on factors such as its own size relative to that of the victim, its own level of aggression, and its measure of hunger. Merely struggling to break free may not be enough counter-aggression to stop an alligator, and may actually prompt a devastating "death roll" response, in which the reptile furiously spins on its central axis to tear muscle and bone free of the victim's body.
- 4.2 These armored saurian are among the toughest beasts in the animal kingdom, so an attack victim should channel his or her nervous energy and will to survive and take the offensive by fighting hard. Not struggling...fighting very, very, very hard. Others on hand during such an event may be able to help by fighting the reptile, too. This should include punching the snout, poking the eyes, and even jabbing the ears, which are seen as small slits behind the eyes.

5.0 Additional Resources

- 5.1 Additional resources can be found at:
 - 5.1.1 <http://www.tpwd.state.tx.us/huntwild/wild/species/alligator/index.phtml>
 - 5.1.2 <http://corkscrew.audubon.org/Wildlife/Alligators.html>

S3NA-314-PR Working Alone and Remote Travel

1.0 Purpose and Scope

- 1.1 This Procedure establishes the requirements for communication and accountability between personnel at a work site to reduce the potential for incidents occurring to one employee without help readily available and to facilitate the rapid mustering of assistance to employees in the event of an emergency.
- 1.2 This procedure applies to all AECOM North America-based employees and operations.

2.0 Terms and Definitions

- 2.1 **Buddy System:** A system of organizing employees at a work site in such a manner that each employee is accompanied by at least one other employee or is escorted by a client or contractor representative during work site activities.
- 2.2 **Controlled Work Areas:** One or more designated work areas on a field project site where hazardous activities and/or strictly defined operations take place. Such controlled work areas include, but are not limited to, remediation or construction sites; a restricted radius where a critical lift operation will take place could be declared a controlled work area. On a HAZWOPER site, the controlled work area is divided into the exclusion zone, the contaminated reduction zone, and the support zone.
- 2.3 **Working Alone:** Performing work with no line of sight or direct voice communication with another person who is aware of your assignment and capable of initiating emergency response.

3.0 Attachments

- 3.1 S3NA-314-ST Working Alone
- 3.2 S3NA-314-WI Wilderness Isolation

4.0 Procedure

- 4.1 Employees are discouraged from working alone on any site. If they will be out of contact with other employees, they will establish a buddy system or check-in procedure with another employee or responsible person.
- 4.2 When traveling alone, staff will take appropriate precautions, including notifying someone of their travel plans as well as carrying a communication device and safety equipment, as appropriate.
- 4.3 Managers will provide the resources (staff, communication devices, etc.) and plans (emergency response plans, check-in procedures, etc.) necessary so that employees are not working alone or have a buddy system in place.
- 4.4 No staff person shall work by themselves or out of contact with other personnel if they are conducting a hazardous job task. On the following tasks, a buddy system will be established:
- Working from heights
 - Working in a confined space
 - Working in a trench
 - Lock out/tag out
 - Working with electricity
 - Working with power tools/equipment
 - Working with hazardous substances or materials
 - Working with material under pressure
 - Working where there is a possible threat of violence
 - Working in isolation from first aid services or immediate/emergency assistance
 - Traveling in severe weather
 - Working in avalanche areas
 - Working on water or ice

- Working in remote or wilderness isolation
- Working in a controlled area
- Extreme heat or cold stress environments
- Working around high traffic or mobile equipment

4.5 **Office Work**

- 4.5.1 Each office will have in place and will communicate as part of its local safety orientation its procedures for the safety and security of an employee working alone in the office.
- 4.5.2 Employees working in the office after regular working hours or in situations where they are working alone will keep the entrance to the office locked.
- 4.5.3 If the building is monitored by a security service, employees working in the office after regular working hours or working alone will notify the security guard of their presence and anticipated hours. If the building does not have a security service, it is advisable that a staff person working alone notify a family member, friend, or manager of his or her location.
- 4.5.4 During all working hours, employees shall stay alert to unauthorized entries into the building and to other suspicious activities and shall report them immediately.
- 4.5.5 Contact numbers to be used in case of emergency are posted at all major exits.

4.6 **Field Work**

- 4.6.1 Prior to work commencing, a hazard assessment shall be prepared for all assignments on which employees are to work alone (in accordance with *S3NA-209-PR Project Hazard Assessment and Planning*). The hazard assessment shall consider travel time, weather, available communications, and the hazards associated with the task and work environment.
- 4.6.2 The assessment should also consider whether the employee assigned to work alone has sufficient training in the tasks to be performed to allow the employee to work safely alone. The employee's personal medical conditions may be considered if the employee has voluntarily made the medical condition known to the Supervisor or Project Manager.
- 4.6.3 The hazard assessment should identify the controls required for the safety of employees as applicable to the job task and location. Some controls associated with working alone or in remote isolation include a buddy system, standardized check-in times, specialized communication devices, and enhanced emergency supply kits.

4.7 **Buddy System**

- 4.7.1 When conducting hazardous work, staff will work with a buddy (another responsible individual) at all times.
- 4.7.2 Client or contractor personnel may be substituted for an AECOM employee's buddy only if they are designated by the client or contractor, are properly trained in this Standard Operating Procedure, and are properly trained in the site's emergency response procedures.
- 4.7.3 Once assigned as buddies, personnel shall remain in each other's line of sight and in direct voice contact at all times.
- 4.7.4 When unusual conditions do not permit line of sight and direct voice contact, the site supervisor will be informed. If permission from the site supervisor is obtained to continue the work, voice contact will be achieved using electronic communication devices such as, but not limited to, hand-held radio or cell phone.
- 4.7.5 When electronic communication devices are used, a protocol will be established and agreed to by each buddy to confirm that periodic effective and faultless communications are maintained:
- The person in communication with the field employee working alone will have direct communication with the employee at a frequency not to exceed each hour.
 - The frequency shall be established considering task hazards, weather conditions, personal medical conditions, and the availability of emergency response.
 - A missed communication event shall trigger emergency response procedures. The results of each communication event shall be documented in the project files.

4.8 Check-In Procedures

- 4.8.1 All field crews will establish check-in procedures prior to leaving the office and confirmed with the assigned Check-In Person.
- 4.8.2 The timing and frequency of those check-in procedures schedule shall be established prior to the initiation of field operations and will vary depending on the task and location of the work.
- At a minimum, all crews will check-in by 5:00 p.m.
 - Crews working in isolation or on hazardous sites will increase their check-in times accordingly (e.g., noon and 5:00 p.m.).
- 4.8.3 If crews will separate once they reach their field site, they will then be considered to be “working alone” and will establish a buddy system with the other members of the crew.
- 4.8.4 Staff working alone or in small crews in remote isolation will have an effective means of communication system including cell/radio/satellite phone as well as established check-in times.
- 4.8.5 The Check-In Procedure will be reviewed daily as part of the Task Hazard Analysis review or more frequently if there is a change in work arrangements that could adversely affect a worker's well-being or a report that the system is not working effectively.

4.9 Emergency Response Procedures (ERP)

- 4.9.1 All field staff AND the Check-In Person will be provided with the Emergency Response Plan (which is documented on the Task Hazard Analysis, if an ERP does not already exist for the site).
- 4.9.2 The Check-In Person will have access to a route map or understands their anticipated route of travel.
- 4.9.3 If communication is lost between buddies or a check-in time is missed, it will be assumed that an emergency situation exists (e.g., severe injury, illness, other accident situation), and the site's emergency response procedures will be implemented. Site work will cease until the emergency is resolved and the site supervisor directs personnel to restart work.
- 4.9.4 The established contact person will follow the procedures below if a field staff member has missed a check-in:
- First, they will attempt to make contact with the field staff directly.
 - If that fails to provide a response, they will contact other persons who may have been on site, including client supervisors, or other locations where the field staff might be (e.g., hotel, home, office).
 - If the field staff still cannot be located, the emergency contact person notifies the project manager or manager responsible for the staff.
 - Depending on the location and situation, they will then dispatch either another AECOM staff member, another on-site supervisor, or an appropriate emergency response agency (e.g., police) to travel to the last known location of the field staff.
 - If the dispatched responder arrives at the site but cannot locate the field staff, the appropriate public emergency contacts (e.g., police, search and rescue) will be made and the staff members' personal contacts shall be notified by Human Resources or the manager (if HR is unavailable).
 - If the dispatched responder finds the crew in an emergency situation (medical, environmental, structural, etc.), the appropriate steps will be taken to isolate the hazard, administer first aid, and notify the appropriate agencies and emergency support services.

4.10 Training

- 4.10.1 All staff will receive an initial orientation that includes the hazards and controls associated with working alone.
- 4.10.2 If working in wilderness, all field staff will be able to orienteer using a map and compass—if not, the basic skills of orienteering will be provided by an experienced staff member before work commences.
- 4.10.3 Staff regularly working in remote, isolated wilderness locations will either participate in a wilderness survival course from a qualified provider (1 or 2 day) or will obtain management approval based on their level of experience/competence in wilderness situations.

S3NA-314-ST Working Alone

The following Occupational Health and Safety regulations apply directly to working alone (and not with a specific job task):

Jurisdiction	Regulation
United States	
OSHA	n/a
Canada	
Alberta	OHS Code (2009) Sect 393, 394 Alberta's Occupational Health and Safety Code: An Explanation of the "Working Alone" Requirements (November 2006) Working Alone Safely - A Guide for Employers and Employees (September 2000)
British Columbia	OHS Regulation (1997) Sect 4.20.1 – 4.22
Manitoba	Workplace Health and Safety Regulation (217/2006) Sect 9.1 – 9.3
New Brunswick	Code of Practice for Working Alone Regulation - Occupational Health and Safety Act (N.B. Reg. 92-133)
Newfoundland/Labrador	n/a
Nova Scotia	n/a
NWT/NU Territories	General Safety Regulations (R.R.N.W.T. 1990, c. S-1), Safety Act (SI-013-92) Sect 14
Ontario	n/a
Prince Edward Island	OHS Regulations (EC180/87) Sect 53.1 – 53.5
Quebec	OHS Regulation (R.R.Q., c. S-2.1, r.19.01 O.C. 885-2001) Sect 322 Safety Code for the Construction Industry (R.R.Q. 1981, c. S-2.1, r. 6) Sect 3.22.1
Saskatchewan	OHS Regulation (R.R.S., c. O-1, r. 1) Sect 35
Yukon Territory	n/a

S3NA-314-WI Wilderness Isolation

1.0 Planning

- 1.1 Working in wilderness isolation presents many more potential hazards and should only be conducted by teams with documented experience, safety plans, and equipment appropriate for the tasks and conditions of the work.
- 1.2 A Safe Work Plan will be approved by the Regional SH&E Manager.

2.0 Safety Equipment

- 2.1 All field staff should regularly carry a compass, fire starter, a small folding saw, and a map on their person.
- 2.2 All field staff should regularly carry a first aid kit and survival equipment applicable to the situation.
- 2.3 All field staff will be equipped with (or have access to) communication devices appropriate to the type of coverage anticipated in the project area.
- 2.4 When hiking long distances, it is recommended that a "mini survival kit" that includes the following items be carried:
- Lighter, matches, or a "flint" of fire steel
 - Fire starter (tinder). Cotton balls with lip balm work well, or paper egg cartons with cotton balls and paraffin wax; if buying commercial fire starter, test it after several months.
 - A whistle
 - Heavy tinfoil (to melt snow, to cook on, or to boil water in)
 - Some high-energy food
 - A Mora knife or folding saw (Japanese tooth rake is best) or "camp chainsaw in a can"
 - Cordage/rope (about 50 feet)
 - Bear spray (and/or bear bangers)
- 2.5 When using an ATV or helicopter for isolated work, it is recommended that a survival bag or backpack that can be left at a known muster point be put together. This bag should include the following items:
- Additional fire starter (tinder)
 - Matches, fire steel
 - A multi-tool (like a Swiss Army knife)
 - A folding saw
 - 3-8'x6" tarps plus one 12 X 16" tarp or larger (or a tent)
 - 100 " of utility cord or parachute cord
 - A small pot
 - Lean spoon
 - A small stove (a small folding military stoves with trioxethelyne tablets will work well)
 - Closed cell foam pads or several square feet of double-wall bubble insulation (the silver sided bubble wrap used in construction) to use as a sleeping pad or for hypothermia treatment
 - Food
 - Water
 - Sleeping bag with a mylar bivy sack to be used as a vapor barrier inside

3.0 Drinking Water

- 3.1 No surface water can be considered safe for human consumption without treatment. Even the cleanest looking spring water could be polluted. Untreated water may be contaminated with bacteria, viruses, or protozoa.
- 3.2 On short trips, carry treated water or obtain water from another safe source.
- 3.3 When field projects take you into remote isolation where there is the potential for not having access to clean drinking water, be sure to take the appropriate tools with you: a water filter, tin foil or a pot for boiling water, or tablets or chemicals for treating the water prior to consumption.
- 3.4 Generally, the chances of finding safe drinking water in the mountains increase as you gain altitude. Intense sunlight at high altitudes kills undesirable bacteria and viruses but harmful cysts are unaffected.
- 3.5 Runoff water from streams below glaciers is often cloudy with silt and should be filtered.
- 3.6 Well water, fast-moving rivers, and the deepest parts of lakes are the best locations to obtain water. Avoid stagnant water, shoreline water, and water close to human habitations and campsites.
- 3.7 During the winter, it is best to use an open water source or to obtain water through a hole in the ice. Check the safety of the ice first. Melting ice and snow consumes fuel and takes extra time. Eating snow or ice directly can lead to chilling and hypothermia and could also cause stomach cramps and headaches. Beware of colored snow, which indicates the presence of algae that could cause diarrhea if ingested. Even in winter, all water should be purified.

3.8 Water Treatment

- 3.8.1 Each method of water treatment has its advantages and disadvantages. Use only treated or boiled water for drinking, brushing teeth, or washing fruits and vegetables that will be eaten raw.
- 3.8.2 Boiling. Heat is the oldest, safest and most effective method of purifying water. Bring the water to a boil for at least one minute (adding one more minute for each 300 m (1000 ft.) above sea level. If the water is cloudy, filter it before boiling. Boiling will give your water a flat taste that can be remedied by pouring the water quickly back and forth from one clean container to another, by letting the water cool, or by adding a pinch of salt per litre of water.
- 3.8.3 Chemical Purification. When boiling is not practical because of time and lack of a heat source, disinfection with chlorine or iodine compounds may be effective. Use two water containers: one for treating water and the other for carrying purified water. After disinfection, shake the container vigorously. Wait five minutes. Shake it again with the lid loose so that some water leaks out to cleanse the mouth of the container. Disinfection alone may not kill some protozoa. Pass the water first through a filter with a pore size of 0.5 micron (absolute) or less to remove protozoa, then disinfect it to kill viruses and bacteria. Disinfection will give the water a peculiar taste. If you find it unpleasant, try using flavoured drink crystals or concentrated citrus juice to mask the taste of the disinfectant. Add drink powders or juice only after the treatment time has elapsed.
- 3.8.4 Filtration. Water filters for use in the wilderness are available, but be wary when making your choice. Avoid filters that allow particles larger than 0.5 microns to pass. Filters with a pore size of 0.1 to 0.3 micron can remove protozoa and bacteria but may not remove viruses. Filtration alone is insufficient to purify water; hence, it should be combined with disinfection to remove viruses. Follow the operating and maintenance instructions carefully.

Table 1: Summary of Water Purification Methods

	Boiling	Chlorine	Iodine	Filters
Bacteria	E	E	E	M
Viruses	E	E	E	N
Protozoa	E	M	M	M
Chemicals	M	N	N	N

E = effective

M = may be effective (see text)

N = not effective

- 3.9 Some water-borne diseases are difficult to diagnose. If you are not feeling well and have recently drunk water from a source in the wild, inform your doctor that you may have consumed untreated water.

S3NA-405-PR Drilling, Boring, and Direct Push Probing

1.0 Purpose and Scope

- 1.1 Provides the minimum requirements to be followed when drilling and boring work are performed.
- 1.2 This procedure applies to all AECOM North America-based employees and operations.

2.0 Terms and Definitions

- 2.1 None

3.0 Attachments

- 3.1 S3NA-405-FM1 Drill Rig Inspection
- 3.2 S3NA-405-FM2 Subsurface Investigation Checklist
- 3.3 S3NA-405-ST Drilling and Boring
- 3.4 S3NA-405-WI Core Drilling Machine Safety Card

4.0 Procedure

- 4.1 All client on-site safety procedures shall be understood and adhered to.
- 4.2 Be aware of the provincial/territorial regulations that govern drill rig operations and exposed moving parts.
- 4.3 **Roles and Responsibilities**
 - 4.3.1 **Project Manager or Resident Engineer** is responsible for ensuring that sound principles of safety, training, inspection, maintenance, and operation consistent with all resource data available from the manufacturer, OSHA, and ANSI is provided to the operator and users by the Contractor or operating entity.
 - 4.3.2 **Site Safety Coordinator (SSC)** shall assist the **Project Manager** in compliance with the requirements of this procedure.
 - 4.3.3 The **SH&E Department** shall assist site management with guidance about this procedure.
 - 4.3.4 **AECOM employees** engaged in project field activities shall be cognizant of contractor activities that may affect their safety and shall follow these procedures.
 - 4.3.5 **AECOM Equipment Operator**
 - In cases where AECOM owns and operates drilling, boring, or probing equipment, the lead equipment operator is responsible for the maintenance and safe operation of equipment under their control consistent with those responsibilities of a Contractor.
 - Operations will be terminated during an electrical storm, and all crew members will move away from the rig. If lightning is observed, shut down all rig operations immediately.
 - 4.3.6 **Contractors**
 - **Contractors** have direct control over the application and operation of all drilling, boring, and probing equipment owned by their organization.
 - It is the **Equipment Contractor** operator's responsibility to implement safe work practices provided by the **Contractor's** project management or supervisory staff supplemented by good judgment, safe control, and caution whenever operating drilling, boring, and probing equipment.
 - 4.3.7 **Safety Representative:** Unless the **Contractor** has a designated **Safety Representative**, the **Contractor's** responsible person for safety for the drill crew will be the drill rig operator. The safety person's responsibilities are to
 - Consider the "responsibility" for safety and the "authority" to enforce safety to be a matter of first importance.

- Be the leader in using proper personal protective equipment (PPE) and set an example in following the rules that are being enforced on others. See section 4.5 for PPE required by this SOP.
- Enforce the use of proper safety equipment and take appropriate corrective action when proper PPE is not being used.
- Understand that the proper maintenance of tools and equipment and general housekeeping on the drill rig will provide an environment that promotes and enforces safety. See Sections 4.7 and 4.9 for housekeeping and maintenance requirements of this SOP.
- Ensure that the operator has had adequate training and is thoroughly familiar with the rig, its controls, and its capabilities prior to commencement of drilling activities.
- Inspect the rig at least daily for structural damage, loose bolts and nuts, proper tension in chain drives, loose or missing guards or protective covers, fluid leaks, damaged hoses, and/or damaged pressure gauges and pressure relief valves. A Rig Inspection Form has been provided in S3NA-405-FM1 Drill Rig Inspection for use in performing inspections when the Contractor does not have their own.
- Check and test all safety devices such as emergency shutdown switches at least daily and preferably at the start of a work shift. Rig operation should not be permitted until all emergency shutdown and warning systems are working correctly. Wiring around, bypassing, or removing an emergency device is not permitted.
- Check that all gauges, warning lights, and control levers are functioning properly, and listen for unusual sounds on each starting of an engine.
- Ensure that all new rig workers are informed of safe operating practices on and around the rig. Provide each new rig worker with a copy of the organization's drilling operations safety procedures and, when appropriate, the rig manufacturer's operations and maintenance manual. The safety person should ensure that each new employee reads and understands the safety procedures.
- Ensure that a first aid kit and fire extinguishers are available and properly maintained on each rig and on each additional vehicle.
- Be well trained and capable of using a first aid kit, a fire extinguisher, and all other safety devices and equipment.
- Maintain a list of addresses and telephone numbers of emergency assistance units (ambulance services, police, hospitals, etc.), and inform other members of the drill crew of its location.
- See that new workers are instructed in rig safety, and observe the new worker's progress toward understanding safe operating practices.
- Observe the mental, emotional, and physical capability of workers to perform the assigned work in a proper and safe manner. Dismiss from the job site any worker whose mental and physical capabilities might cause injury to the worker or coworkers.
- Rig Crew and Other Field Personnel (Those employees involved in fieldwork): All personnel engaged in site activities are required to become thoroughly familiar with, and to conform to, the provisions of AECOM's safety plan, procedures, and such other safety directives as may be considered appropriate by **Project Managers, Safety Officers, and Supervisors**.
- Rig Workers: Personnel are encouraged to offer ideas, suggestions, or recommendations regarding any operational condition, procedure, or practice that may enhance the safety of site personnel or the public. Their primary responsibilities will be:
 - Perform all required work safely.
 - Familiarize themselves with and understand the plan, including proper use of personal protective equipment.
 - Report any unsafe conditions to supervisory personnel.
 - Be aware of signs and symptoms of thermal stress.

4.4 Training

4.4.1 All staff shall be provided with on-site orientation to the rig and its operator.

4.4.2 All operators and assistants shall have industry-standard safety training and be versed in the equipment to be utilized. This may include, but is not limited to, HAZWOPER, Petroleum Safety Training (or Construction Safety Training), and H2S Alive as appropriate.

4.5 **Personal Protective Equipment**

4.6 For most geotechnical, mineral, and/or groundwater drilling projects, PPE should include

- Hard hat: Hard hats shall be worn by everyone working at a drilling/boring site. Hats should meet the requirements of ANSI Z89 and be kept clean and in good repair with the headband and crown straps properly adjusted for the employee.
- Safety shoes: Safety shoes or boots shall be worn by all drilling personnel and all visitors to the site who observe operations within close proximity of the rig. Safety shoes or boots should meet the requirements of ANSI Z4 1.1.
- Safety glasses: All rig personnel shall wear safety glasses meeting the requirements of ANSI Z87.1.
- High Visibility Class II Safety Vest shall be worn by all **AECOM employees**. All rig personnel should attempt to wear high-visibility clothing that should be close fitting and not have large cuffs or loose material that can catch on rotating or translating components of the rig.
- Close fitting gloves and clothing: All rig personnel should wear gloves for hand protection against cuts and abrasions that could occur while handling wire rope or cable and from contact with sharp edges and burrs on drill rods and other drilling or sampling tools. Gloves should be close fitting and not have large cuffs or loose ties which can catch on rotating or translating components of the rig.
- Other protective equipment: For some operations, the project may dictate use of other protective equipment. The management of the contractor and its safety person shall determine the requirements. Such equipment might include face or ear protection or reflective clothing. The design and composition of the protective equipment and clothing should be determined as a joint effort of management and the client.
- Each worker should wear noise reducing ear protectors around operating equipment or during elevated noise levels.
- When drilling, boring, or probing is performed in chemically or radiological contaminated ground, special protective equipment and clothing will probably be required.
- The clothing of the individual rig worker is not generally considered protective equipment; however, clothing should be close fitting and comfortable without loose ends, straps, draw strings or belts or otherwise unfastened parts that might catch on some rotating or translating component of the rig. Rings and jewelry should not be worn during a work shift.

4.7 **Housekeeping**

4.7.1 A key requirement for safe field operations is that the Contractor safety person understands and fulfills the responsibility for maintenance and “housekeeping” on and around the drill rig, including the following:

- Suitable storage locations should be provided for all tools, materials, and supplies so that tools, materials, and supplies can be conveniently and safely handled without hitting or falling on a member of the crew or a visitor.
- Storage or transporting tools, materials, or supplies within or on the mast (derrick) of the rig should be avoided.
- Pipe, drill rods, probe rods, casing augers, and similar tooling should be orderly stacked on racks or sills to prevent spreading, rolling, or sliding.
- Penetration or other driving hammers should be placed at a safe location on the ground or be secured to prevent movement when not in use.
- Work areas, platforms, walkways, scaffolding and other accesses should be kept free of materials, debris and obstructions and substances such as ice, grease, or oil that could cause a surface to become slick or otherwise hazardous.
- All controls, control linkages, warning and operation lights, and lenses should be kept free of oil, grease, and/or ice.
- Do not store gasoline in any portable container other than a non-sparking, red safety container with a flame arrester in the fill spout and having the word “gasoline” easily visible.

4.8 Traffic Control

4.8.1 When operating near public vehicular and pedestrian traffic, the on-site personnel shall take every precaution necessary to see that the work zone is properly established, identified, and isolated from both moving traffic and passerby pedestrians.

4.8.2 All traffic control devices shall be installed, placed, and maintained in accordance with the Traffic Control Plan, client specifications, and/or the Manual of Uniform Traffic Control Devices (MUTCD). Traffic control devices shall consist of and not be limited to:

- Directional and informational signage;
- High visibility barricades, cones, or barrels;
- Lighting; and
- Other equipment and devices as required.

4.9 Maintenance & Inspection

4.9.1 Good maintenance and thorough inspection will make operations safer. Maintenance tasks should be done safely by a qualified maintenance person. Inspection and maintenance tasks include but are not limited to the following requirements:

- Inspections shall be completed at the beginning of each day by the equipment operator and in the presence of an AECOM employee when the equipment is not owned and operated by AECOM. A Rig Inspection Form is provided in S3NA-405-FM1 Drill Rig Inspection for use in performing inspections.
- Safety glasses should be worn when performing maintenance on a rig or on drilling or probing tools.
- The drill rig engine should be shut down to make repairs or adjustments to a drill rig or to lubricate fittings (except repairs or adjustments that can only be made with the engine running).
- Precautions should be taken to prevent accidental starting of an engine during maintenance by removing or tagging the ignition key.
- Wheels or the lowering of leveling jacks or both should be blocked ("zero energy state") and hand brakes set before working under a drill rig.
- When possible and appropriate, all pressure on the hydraulic systems should be released as well as the drilling fluid system and the air pressure systems of the drill rig prior to performing maintenance. In other words, reduce the drill rig and operating systems to a "zero energy state" before performing maintenance. Use extreme caution when opening drain plugs and radiator caps and other pressurized plugs and caps.
- Personnel shall not touch an engine or the exhaust system of an engine following its operation until the engine and exhaust system have adequate time to cool.
- Welding and cutting shall not occur on or near a fuel tank.
- Wire rope safety factors shall be in accordance with American National Standards Institute B 30.5-1968 or SAE J959-1966.
- Gasoline or other volatile or flammable liquids shall not be used as a cleaning agent on or around an I rig.
- The manufacturer's recommendations should be followed for applying the proper quantity and quality of lubricants, hydraulic oils, and/or coolants.
- All caps, filler plugs, protective guards, panels, high-pressure hose clamps, chains, or cables that have been removed for maintenance should be replaced.

4.10 Hand Tools

4.10.1 A large number of hand tools can be used on or around a drill or probe rig and in repair shops and more than an equal number of instructions for proper use exist. "Use the tool for its intended purpose" is the most important rule. Additionally, equipment operators and assistants should not use their hand in place of the proper tool; work shall be stopped until the correct tool can be found. The following are a few specific and some general suggestions that apply to the safe use of several hand tools that are often used on and around rigs:

- When a tool becomes damaged, either repair it before using it again or get rid of it.
- When using a hammer, any kind of hammer for any purpose, wear safety glasses and require all others around you to wear safety glasses.

- When using a chisel, any kind of chisel, for any purpose, wear safety glasses and require all others around you to wear safety glasses.
- Keep all tools cleaned and orderly stored when not in use.
- Use wrenches on nuts; don't use pliers on nuts.
- Use screwdrivers with blades that fit the screw slot.
- When using a wrench on a tight nut, first use some penetrating oil, use the largest wrench available that fits the nut, when possible pull on the wrench handle rather than pushing, and apply force to the wrench with both hands when possible and with both feet firmly placed. Don't push or pull with one or both feet on the drill rig or the side of a mud pit or some other blocking-off device. Always assume that you may lose your footing – check the place where you may fall for sharp objects.
- Keep all pipe wrenches clean and in good repair. The jaws of pipe wrenches should be wire brushed frequently to prevent an accumulation of dirt and grease which would otherwise build up and cause wrenches to slip. Replace hook and heel jaws when they become visibly worn.
- Avoid the use pipe wrenches in place of a rod-holding device whenever possible.
- When breaking tool joints on the ground or on a drilling platform, position your hands so that your fingers will not be smashed between the wrench handle and the ground or the platform, should the wrench slip or the joint suddenly let go.

4.11 Clearing Work Areas

4.11.1 Prior to set up, adequate site clearing and leveling should be performed to accommodate the rig and supplies and provide a safe working area. Clearing the site includes clearing the intended drilling area of underground utilities in accordance with *S3NA-417-PR Utilities, Underground*. Drilling or probing should not be commenced when tree limbs, unstable ground or site obstructions cause unsafe tool handling conditions.

4.11.2 Start-Up

- All rig personnel and visitors should be instructed to "stand clear" of the rig immediately prior to and during starting of an engine.
- Make sure all gear boxes are in neutral, all hoist levers are disengaged, all hydraulic levers are in the neutral-actuating positions, and the cathead rope is not on the cathead before starting a drill rig engine.
- Start all engines according to the manufacturer's manual.

4.12 Drilling and Probing Operations

4.12.1 The following safety measures shall be taken during drilling and probing operations on-site:

- The operator and helper shall be present during all active rig operations.
- Site personnel shall remain within visual contact of the rig operator.
- Hard hats, approved safety boots and hearing protection shall be worn in the presence of a rig.
- Services shall be cleared prior to drilling or probing.
- Hands shall be kept away from moving parts (augers).
- The emergency shut-off switch on the rig should be identified to site personnel and tested on a regular basis by the operator.
- Unauthorized personnel shall be kept clear of the rig.

4.12.2 Safety requires the attention and cooperation of every worker and site visitor.

- Do not drive the rig from hole to hole with the mast (derrick) in the raised position.
- Before raising the mast (derrick) look up to check for overhead obstructions. Refer to *S3NA-417-PR Utilities, Underground* and *S3NA-406-PR Electrical Lines, Overhead*.
- Before raising the mast (derrick), all rig personnel (with the exception of the operator) and visitors should be cleared from the areas immediately to the rear and the sides of the mast. All rig personnel and visitors should be informed that the mast is being raised prior to raising it.
- Before the mast (derrick) of a drill rig is raised and drilling is commenced, the drill rig shall be first leveled and stabilized with leveling jacks and/or solid cribbing. The drill rig should be releveled if it settles after initial set up. Lower the mast (derrick) only when the leveling jacks are down, and do not raise the leveling jack pads until the mast (derrick) is lowered completely.

- Before starting drilling operations, secure and/or lock the mast (derrick) if required according to the drill manufacturer's recommendations.
- The operator of a rig should only operate a drill rig from the position of the controls. If the operator of the rig shall leave the area of the controls, the operator should shift the transmission controlling the rotary drive into neutral and place the feed control lever in neutral. The operator should shut down the drill engine before leaving the vicinity of the drill.
- Throwing or dropping tools will not be permitted. All tools should be carefully passed by hand between personnel or a hoist line should be used.
- Do not consume alcoholic beverages or other depressants or chemical stimulants prior to starting work on a rig or while on the job.
- If it is necessary to operate the rig within an enclosed area, make certain that exhaust fumes are conducted out of the area. Exhaust fumes can be toxic and some cannot be detected by smell.
- Clean mud and grease from your boots before mounting a rig platform and use hand holds and railings. Watch for slippery ground when dismounting from the platform.
- During freezing weather, do not touch any metal parts of the rig with exposed flesh. Freezing of moist skin to metal can occur almost instantaneously.
- All air and water lines and pumps should be drained when not in use if freezing weather is expected.
- All unattended bore holes shall be adequately covered or otherwise protected to prevent rig personnel, site visitors, or animals from stepping or falling into the hole. All open bore holes should be covered, protected, or backfilled adequately and according to local or state regulations on completion of the drilling project.
- "Horsing around" within the vicinity of the drill rig and tool and supply storage areas should never be allowed, even when the rig is shut down.
- When using a ladder on a rig, face the ladder and grasp either the side rails or the rungs with both hands while ascending or descending. Always use adequate fall protection and a full body harness when climbing above six feet of the ground. Do not attempt to use one or both hands to carry a tool while on a ladder. Use a hoist line and a tool "bucket" or a safety hook to raise or lower hand tools.

4.13 **Elevated Derrick Platforms**

4.13.1 The following precautions should be used:

- When a rig worker first arrives at a derrick platform, the platform should immediately be inspected for broken members, loose connections, and loose tools or other loose materials.
- A derrick platform over 4 feet (1.2 m) above ground surface should have toe boards and safety railings that are in good condition.
- When climbing to a derrick platform that is higher than 6 feet (am), a fall arresting device shall be used. The fall arresting device should consist of a full body harness and fall protection. The harness should fit snugly but comfortably. The lifeline when attached to the derrick should be less than 6 feet (2 m) long and attached to a fall arrester. The harness and lifeline should be strong enough to withstand the dynamic force of a 250-pound (115 kg) weight (contained within the belt) falling 6 feet (2 m).
- When a rig worker is on a derrick platform, the lifeline should be fastened to the derrick just above the derrick platform and to a structural member that is not attached to the platform or to other lines or cables supporting the platform.
- Tools should be securely attached to the platform with safety lines. Do not attach a tool to a line attached to your wrist or any other part of your body.
- When you are working on a derrick platform, do not guide drill rods or pipe into racks or other supports by taking hold of a moving hoist line or a traveling block.
- Loose tools and similar items should not be left on the derrick platform or on structural members of the derrick.
- Workers on the ground or the drilling floor should avoid being under rig workers on elevated platforms whenever possible.

4.14 Lifting Heavy Objects

- 4.14.1 Before lifting any object without using a hoist, make sure that the load is within your personal lifting capacity. If it is too heavy, ask for assistance.
- 4.14.2 Before lifting a relatively heavy object, approach the object by bending at the knees, keeping your back vertical and unarched while obtaining a firm footing. Grasp the object firmly with both hands and stand slowly and squarely while keeping your back vertical and unarched. In other words, perform the lifting with the muscles in your legs, not with the muscles in your lower back.
- 4.14.3 If a heavy object shall be moved some distance without the aid of machinery, keep your back straight and unarched. Change directions by moving your feet, not by twisting your body.
- 4.14.4 Move heavy objects with the aid of handcarts or lifting devices whenever possible.

4.15 Use of Wire Line Hoists, Wire Rope, and Hoisting Hardware

- 4.15.1 The use of wire line hoists, wire rope, and hoisting hardware should be as stipulated by the American Iron Steel Institute, Wire Rope Users Manual.
 - All wire ropes and fittings should be visually inspected during use and thoroughly inspected at least once a week for abrasion, broken wires, wear, reduction in rope diameter, reduction in wire diameter, fatigue, corrosion, damage from heat, improper revving, jamming, crushing, bird caging, kinking, care protrusion, and damage to lifting hardware. Wire ropes should be replaced when inspection indicates excessive damage according to the Wire Rope Users Manual. All wire ropes that have not been used for a period of a month or more should be thoroughly inspected before being returned to service.
 - End fittings and connections consist of spliced eyes and various manufactured devices. All manufactured end fittings and connections should be installed according to the manufacturer's instructions and loaded according to the manufacturer's specifications.
 - If a ball-bearing type hoisting swivel is used to hoist drill rods, swivel bearings should be inspected and lubricated daily to ensure that the swivel freely rotates under load.
 - If a rod-slipping device is used to hoist drill or probe rods, do not drill through or rotate drill rods through the slipping device; do not hoist more than 1 foot (.3 m) of the rod column above the top of the mast (derrick); and do not hoist a rod column with loose tool joints while the rod column is being supported by a rod slipping device. If rods should slip back into the hole, do not attempt to break the fall of the rods with your hands or by applying tension to the slipping device.
 - Most sheaves on exploration drill rigs are stationary with a single part line. The number of parts of line should never be increased without first consulting with the manufacturer of the drill rig.
 - Wire ropes shall be properly matched with each sheave. If the rope is too large, the sheave will pinch the wire rope; if the rope is too small, it will groove the sheave. Once the sheave is grooved, it will severely pinch and damage larger-sized wire ropes and therefore shall be replaced.
- 4.15.2 The following procedures and precautions shall be understood and implemented for safe use of wire ropes and rigging hardware.
 - Use tool-handling hoists only for vertical lifting of tools (except when angle hole drilling). Do not use tool-handling hoists to pull on objects always from the rig; however, drills may be moved using the main hoist if the wire rope is spooled through proper sheaves according to the manufacturer's recommendations.
 - When struck tools or similar loads cannot be raised with a hoist, disconnect the hoist line and connect the stuck tools directly to the feed mechanism of the drill. Do not use hydraulic leveling jacks for added pull to the hoist line or the feed mechanism of the drill.
 - When attempting to pull out a mired down vehicle or drill rig carrier, only use a winch on the front or rear of the vehicle and stay as far as possible away from the wire rope. Do not attempt to use tool hoists to pull out a mired down vehicle or drill rig carrier.
 - Minimize shock loading of a wire rope. Apply loads smoothly and steadily. Avoid sudden loading in cold weather.
 - Never use frozen ropes.
 - Protect wire rope from sharp corners or edges.
 - Replace faulty guides and rollers.

- Replace damaged safety latches on safety hooks before using.
- Know the safe working load of the equipment and tackle being used. Never exceed this limit.
- Clutches and brakes of hoists should be periodically inspected and tested.
- Know and do not exceed the rated capacity of hooks, rings, links, swivels, shackles, and other lifting aids.
- Always wear gloves when handling wire ropes.
- Do not guide wire rope on hoist drums with your hands.
- Following the installation of a new wire rope, first lift a light load to allow the wire rope to adjust.
- Never carry out any hoisting operations when the weather conditions are such that hazards to personnel, the public, or property are created.
- Never leave a load suspended in the air when the hoist is unattended.
- Keep your hands away from hoists, wire rope, hoisting hooks, sheaves, and pinch points while slack is being taken up and when the load is being hoisted.
- Never hoist the load over the head, body, or feet of any personnel. Never use a hoist line to "ride" up the mast (derrick) of a drill rig.
- Replacement wire ropes should conform to the drill rig manufacturer's specifications.

4.16 **Use of Cathead and Rope Hoists**

4.16.1 The following safety procedures should be employed when using a cathead hoist:

- Keep the cathead clean and free of rust and oil and/or grease. The cathead should be cleaned with a wire brush if it becomes rusty.
- Check the cathead periodically, when the engine is not running, for rope wear grooves. If a rope groove forms to a depth greater than 1/8 inches (3 mm), the cathead should be replaced.
- Always use a clean, dry, sound rope. A wet or oily rope may "grab" the cathead and cause drill tools or other items to be rapidly hoisted to the top of the mast.
- Should the rope "grab" the cathead or otherwise become tangled in the drum, release the rope and sound an appropriate alarm for all personnel to rapidly back away and stay clear. The operator should also back away and stay clear. If the rope "grabs" the cathead, and tools are hoisted to the sheaves at the top of the mast, the rope will often break, releasing the tools. If the rope does not break, stay clear of the drill rig until the operator cautiously returns to turn off the drill rig engine and appropriate action is taken to release the tools. The operator should keep careful watch on the suspended tools and should quickly back away after turning off the engine.
- The rope should always be protected from contact with all chemicals. Chemicals can cause deterioration of the rope that may not be visibly detectable.
- Never wrap the rope from the cathead (or any other rope, wire rope or cable on the drill rig) around a hand, wrist, arm, foot, ankle, leg or any other part of your body.
- Always maintain a minimum of 18 inches of clearance between the operating hand and the cathead drum when driving samplers, casing or other tools with the cathead and rope method. Be aware that the rope advances toward the cathead with each hammer blow as the sampler or other drilling tool advances into the ground.
- Never operate a cathead (or perform any other task around a drill rig) with loose unbuttoned or otherwise unfastened clothing or when wearing gloves with large cuffs or loose straps or laces.
- Do not use a rope that is any longer than necessary. A rope that is too long can form a ground loop or otherwise become entangled with the operator's legs.
- Do not use more rope wraps than are required to hoist a load.
- Do not leave a cathead unattended with the rope wrapped on the drum. Position all other hoist lines to prevent contact with the operating cathead rope.
- When using the cathead and rope for driving or back driving, make sure that all threaded connections are tight and stay as far away as possible from the hammer impact point.
- The cathead operator shall be able to operate the cathead standing on a level surface with good, firm footing conditions without distraction or disturbance.

4.17 Use of Augers

4.17.1 The following general procedures should be used when starting a boring with continuous flight of hollow-stem augers:

- Prepare to start an auger boring with the drill rig level, the clutch or hydraulic rotation control disengaged, the transmission in low gear, and the engine running at low RPM.
- Apply an adequate amount of down pressure prior to rotation to seat the auger head below the ground surface.
- Look at the auger head while slowly engaging the clutch or rotation control and starting rotation. Stay clear of the auger.
- Slowly rotate the auger and auger head while continuing to apply down pressure. Keep one hand on the clutch or the rotation control at all times until the auger has penetrated about one foot or more below ground surface.
- If the auger head slides out of alignment, disengage the clutch or hydraulic rotation control and repeat the hole starting process.
- An auger guide can facilitate the starting of a straight hole through hard ground or a pavement.
- The operator and tool handler should establish a system of responsibility for the series of various activities required for auger drilling, such as connecting and disconnection auger sections, and inserting and removing the auger fork. The operator shall ensure that the tool handler is well away from the auger column and that the auger fork is removed before starting rotation.
- Only use the manufacturer's recommended method of securing the auger to the power coupling. Do not touch the coupling or the auger with your hands, a wrench, or any other tools during rotation.
- Whenever possible, use tool hoists to handle auger sections.
- Never place hands or fingers under the bottom of an auger section when hoisting the auger over the top of the auger section in the ground or other hard surfaces such as the drill rig platform.
- Never allow feet to get under the auger section that is being hoisted.
- When rotating augers, stay clear of the rotating auger and other rotating components of the drill rig. Never reach behind or around a rotating auger for any reason.
- Use a long-handled shovel to move auger cuttings away from the auger. Never use your hands or feet to move cuttings away from the auger.
- Do not attempt to remove earth from rotating augers. Augers should be cleaned only when the drill rig is in neutral and the augers are stopped from rotating.

4.18 Rotary and Core Drilling

4.18.1 Rotary drilling tools should be safety checked prior to drilling:

- Water swivels and hoisting plugs should be lubricated and checked for "frozen" bearings before use.
- Drill rod chuck jaws should be checked periodically and replaced when necessary.
- The capacities of hoists and sheaves should be checked against the anticipated weight to the drill rod string plus other expected hoisting loads.

4.18.2 Special precautions that should be taken for safe rotary or core drilling involve chucking, joint break, hoisting, and lowering of drill rods:

- Only the operator of the drill rig should brake or set a manual chuck so that rotation of the chuck will not occur prior to removing the wrench from the chuck.
- Drill rods should not be braked during lowering into the hole with drill rod chuck jaws. Drill rods should not be held or lowered into the hole with pipe wrenches.
- If a string of drill rods are accidentally or inadvertently released into the hole, do not attempt to grab the falling rods with your hands or a wrench.
- In the event of a plugged bit or other circulation blockage, the high pressure in the piping and hose between the pump and the obstruction should be relieved or bled down before breaking the first tool joint.
- When drill rods are hoisted from the hole, they should be cleaned for safe handling with a rubber or other suitable rod wiper. Do not use your hands to clean drilling fluids from drill rods.

- If work shall progress over a portable drilling fluid (mud) pit, do not attempt to stand on narrow sides or cross members. The mud pit should be equipped with rough-surfaced, fitted cover panels of adequate strength to hold drill rig personnel.
- Drill rods should not be lifted and leaned unsecured against the mast. Either provide some method of securing the upper ends of the drill rod sections for safe vertical storage or lay the rods down.

4.19 **Site Movement of Equipment**

4.19.1 The individual who transports a rig on and off a drilling site should:

- Be properly licensed and should only operate the vehicle according to federal, state, and local regulations.
- Know the traveling height (overhead clearance), width, length and weight of the rig with carrier and know highway and bridge load, width and overhead limits, making sure these limits are not exceeded with an adequate margin.
- Never move a rig unless the vehicle brakes are in sound working order.
- Allow for mast overhand when cornering or approaching other vehicles or structures.
- Be aware that the canopies of service stations and motels are often too low for a drill rig mast to clear with the mast in the travel position.
- Watch for low hanging electrical lines, particularly at the entrances to drilling sites or restaurants, motels, other commercial sites.
- Never travel on a street, road, or highway with the mast (derrick) of the rig in the raised or partially raised position.
- Remove all ignition keys if rig is left unattended.

4.19.2 Loading and Unloading

- Use ramps of adequate design that are solid and substantial enough to bear the weight of the rig with carrier, including tools.
- Load and unload on level ground.
- Use the assistance of someone on the ground as a guide.
- Check the brakes on the rig carrier before approaching loading ramps.
- Distribute the weight of the rig, carrier, and tools on the trailer so that the center of weight is approximately on the centerline of the trailer and so that some of the trailer load is transferred to the high of the pulling vehicle. Refer to the trailer manufacturer's weight distribution recommendations.
- The rig and tools should be secured to the hauling vehicle with ties, chains, and/or load binders of adequate capacity.

4.19.3 Off-Road Movement

The following safety suggestions relate to off-road movement:

- Before moving a drill rig, first walk the route of travel, inspecting for depressions, stumps, gullies, ruts, and similar obstacles.
- Always check the brakes of a drill rig carrier before traveling, particularly on rough, uneven, or hilly ground.
- Check the complete drive train of a carrier at least weekly for loose or damaged bolts, nuts, studs, shafts, and mountings.
- Discharge all passengers before moving a drill rig on rough or hilly terrain.
- Engage the front axle (for 4 x 4, 6 x 6, etc. vehicles or carriers) when traveling off highway on hilly terrain.
- Use caution when traveling side-hill. Conservatively evaluate side-hill capability of drill rigs, because the arbitrary addition of drilling tools may raise the center of mass. When possible, travel directly uphill or downhill. Increase tire pressures before traveling in hilly terrain (do not exceed rated tire pressure).
- Attempt to cross obstacles such as small logs and small erosion channels or ditches squarely, not at an angle.
- Use the assistance of someone on the ground as a guide when lateral or overhead clearance is close.

- After the drill has been moved to a new drilling site, set all brakes and/or locks. Always block/chock the wheels.

4.20 **Tires, Batteries, and Fuel**

4.20.1 Tires on the rig shall be checked daily for safety and during extended travel for loss of air and they shall be maintained and/or repaired in a safe manner. If tires are deflated to reduce ground pressure for movement on soft ground, the tires should be inflated to normal pressures before movement on firm or hilly ground or on streets, roads and highways. Under-inflated tires are not as stable on firm ground as properly inflated tires. Air pressures should be maintained for travel on streets, roads, and highways according to the manufacturer's recommendations. During air pressure checks, inspect for:

- Missing or loose wheel lugs.
- Objects wedged between dual or embedded in the tire casing. Damaged or poorly fitting rims or rim flanges.
- Abnormal wear, cuts, breaks, or tears in the casing.
- The repair of truck and off-highway tires should only be made with required special tools and following the recommendations of a tire manufacturer's repair manual.

4.20.2 Batteries contain strong acid. Use extreme caution when servicing batteries.

- Batteries should only be serviced in a ventilated area while wearing safety glasses.
- When a battery is removed from a vehicle or service unit, disconnect the battery ground clamp first.
- When installing a battery, connect the battery ground clamp last.
- When charging a battery with a battery charger, turn off the power source to the battery before either connecting or disconnecting charger leads to the battery posts. Cell caps should be loosened prior to charging to permit the escape of gas.
- Spilled battery acid can burn your skin and damage your eyes. Spilled battery acid should be immediately flushed off of your skin with lots of water. Should battery acid get into someone's eyes, flush immediately with large amounts of water and see a physician at once.
- To avoid battery explosions, keep the cells filled with electrolyte; use a flashlight (not an open flame) to check electrolyte levels and avoid creating sparks around the battery by shorting across a battery terminal. Keep lighted smoking materials and flames away from batteries.

4.20.3 Special precautions shall be taken for handling fuel and refueling the rig or carrier. Only use the type and quality of fuel recommended by the engine manufacturer.

- Refuel in a well-ventilated area.
- Do not fill fuel tanks while the engine is running. Turn off all electrical switches. Do not spill fuel on hot surfaces. Clean any spillage before starting an engine. Wipe up spilled fuel with cotton rags or cloths. Do not use wool or metallic cloth.
- Keep open lights, lighted smoking materials, and flames or sparking equipment well away from the fueling area.
- Turn off heaters in carrier cabs when refueling the carrier or the drill rig.
- Do not fill portable fuel containers completely full to allow expansion of the fuel during temperature changes.
- Keep the fuel nozzle in contact with the tank being filled to prevent static sparks from igniting the fuel.
- Do not transport portable fuel containers in the vehicle or carrier cab with personnel.
- Fuel containers and hoses should remain in contact with a metal surface during travel to prevent the buildup of static charge.

4.21 **First Aid (see S3NA-207-PR Medical Services and First Aid)**

4.21.1 At least one member of the crew (and if only one, preferably the drilling and safety supervisor) should be trained to perform first aid. First aid is taught on a person-to-person basis, not by providing or reading a manual. Manuals should only provide continuing reminders and be used for reference. It is suggested that courses provided or sponsored by the American Red Cross or a similar organization would best satisfy the requirements of first aid training for drill crews.

4.21.2 For drilling and probing operations it is particularly important that the individual responsible for first aid should be able to recognize the symptoms and be able to provide first aid for electrical shock, heart

attack, stroke, broken bones, eye injury, snake bite, and cuts or abrasions to the skin. Again, first aid for these situations is best taught to drill crewmembers by instructors qualified by an agency such as the American Red Cross.

- 4.21.3 A first aid kit should be available and well maintained on each drill site. The contents of the first aid kit shall be placed in a weatherproof container with individual sealed packages for each type of item.

4.22 **Rig Utilization**

- 4.22.1 Do not attempt to exceed manufacturers' ratings of speed, force, torque, pressure, flow, etc.

- 4.22.2 Only use the drill rig and tools for the purposes that they are intended and designed.

4.23 **Rig Alterations**

- 4.23.1 Alterations to a rig or drilling or probing tools should only be made by qualified personnel and only after consultation with the manufacturer.

Inspect and lubricate parts daily	<input type="checkbox"/> Yes	<input type="checkbox"/> No
Comments:		

Auger Operations—what to look for:

- A system of responsibility between the operator and the tool handler when connecting and disconnecting auger sections and inserting and removing auger fork.
- During connecting and disconnecting auger sections and inserting auger for the tool, handler should position himself away from the auger column while it is rotating.
- When securing the auger to the power coupling, pin should be inserted and tapped into place using a hammer or other similar device.
- Tool hoist should be used to lower second section of auger into place.
- Both operators should be clear of auger as it is being lifted into place.
- Long-handled shovel should be used to move dirt away from auger.

*Note: As you conduct your inspection, you should be able to answer each question with a **YES**.*

*If the answer to any question is **NO**, this deficiency should be corrected as soon as possible.*

	YES	NO	OK	N/A
1. Do on-site personnel have required-level PPE (steel-toe boots, safety vests, hard hats, safety glasses, and gloves)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Is there a copy of HASP and EAP available at each drill rig location?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Are there a PID, multi-gas meter, and a colorimetric pump available at each drill rig location?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Has the field screening equipment been calibrated in the morning?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Are calibration gases available at the site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Are drilling fluids contained in the mud tub?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6a. Does mud tub setup provide adequate splash guards to protect the public?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6b. Does setup present five (5) feet of walk space for the public?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6c. Will the mud tub be emptied at end of day?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6d. Explain how the mud tub will be covered to prevent an accident.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6e. Are adequate containment practices being implemented to prevent mud tub liquids from being released onto pedestrian walkways?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Is the drill rig properly grounded?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. Is there a DOT permit available on site at each drill rig location?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8a. Are operations in compliance with DOT permit?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
9. Is there an orange snow fence with appropriate warning signage erected as a site barrier around the drill rig to keep pedestrians out of the work area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
10. Are hydrant water hoses out of the pedestrian sidewalk?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
11. Are smoking and eating prohibited in the immediate work area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
12. Does each drill rig have a fire extinguisher, absorbent materials to cleanup a spill, and a first aid kit?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
13. Is the waste from the mud tub properly contained in 55-gallon drums?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
13a. Are drums properly labeled?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
14. Are proper housekeeping procedures followed to avoid slips, trips, and falls?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
15. Are decontamination/hand washing facilities available at the site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

S3NA-405-WI Core Drilling Machine Safety Card

1.0 Objective / Overview

- 1.1 Core drilling machines are used on all types of jobs. They can be electrical or gas powered and come with a stand or can be hand held. Caution should be used when operating such a machine. It may look harmless and easy to run, but drilling machines have many hazards.

2.0 Safe Operating Guidelines

- 2.1 Clean the flanges before mounting the blade.
- 2.2 Make sure the blade is correct for the material being cut and that the arrow on the blade corresponds with the direction of rotation of the machine spindle.
- 2.3 Avoid tilting the blade when cutting.
- 2.4 Use only the machines that have an approved safety guard.
- 2.5 Remove the diamond blade from the machine during transit to prevent accidental damage.
- 2.6 Inspect the blades frequently to detect cracks or undercutting of the steel center.
- 2.7 Don't let excessive heat be generated at the cutting edge of the blade.
- 2.8 Use adequate water supply to both sides of the blade.
- 2.9 Follow the manufacturers recommended pulley sizes and operating speeds for specific blade diameters.
- 2.10 Make sure to tighten drive belts to ensure full available power.
- 2.11 Don't force the blade on the blade shaft or mount blade on an undersized spindle.

3.0 Potential Hazards

- 3.1 Electrical shock.
- 3.2 Flying debris.
- 3.3 Severe cuts.
- 3.4 Hearing loss.
- 3.5 Breathing fumes or dust.
- 3.6 Binding/biting – torque control.

4.0 Training Requirements

- 4.1 Review of Applicable SOPs (e.g., *S3NA-305-PR Hand and Power Tools*; *S3NA-302-PR Electrical, General*).
- 4.2 Demonstrated knowledge on the use of a coring machine.
- 4.3 Review and follow manufacturers' operating guidelines.

5.0 Personal Protective Equipment (Level D PPE)

- 5.1 Leather gloves.
- 5.2 Face shield.
- 5.3 Steel-toed/composite-toed boots.
- 5.4 Hearing protection.

5.5 Respirator or dust mask.

6.0 Other Safety Tips

6.1 Keep fingers and hands away from the cutting edge.

6.2 Hold handle firmly when operating.

6.3 A subsurface utility clearance should be performed prior to initiating drilling operations.

6.4 Stand firmly and apply body weight at anchored side of guarded platform.

S3NA-406-PR Electrical Lines, Overhead

1.0 Purpose and Scope

- 1.1 Provides the safe work requirements to be observed where overhead power lines are present on a job site.
- 1.2 This procedure applies to all AECOM North America-based employees and operations.

2.0 Terms and Definitions

- 2.1 Types of overhead lines:
 - 2.1.1 Overhead power lines
 - 2.1.2 Structural cable supports
 - 2.1.3 Guy wires
 - 2.1.4 Cable television / communication lines

3.0 Attachments

- 3.1 S3NA-406-FM Overhead Electrical Lines Acknowledgement Form

4.0 Procedure

- 4.1 An appropriate distance must be kept between equipment and overhead utility lines.
- 4.2 **Employees** must contact the power line operator before work is done or before equipment is operated within 15.25 metres (50 feet) of an energized overhead power line, in order to:
 - 4.2.1 Determine the voltage of the power line, and
 - 4.2.2 Establish the appropriate safe limit of approach distance as identified by provincial/territorial regulations.
- 4.3 The safe limit of approach distances do not apply to a load, equipment, or building that is transported under energized overhead power lines if the total height, including equipment transporting it, is less than 4.15 metres (13.5 feet).
- 4.4 **Employers** or **Project Managers** must formally notify (using the *S3NA-406-FM Overhead Electrical Lines Acknowledgement form*) all subcontractors or equipment operators of an energized overhead power line before work is done or equipment is operated in the vicinity of the power line at distances less than the safe limit of approach distances and obtain the operator's assistance in protecting workers involved.
- 4.5 **Employees** must not place earth or other material under or beside an overhead power line if doing so reduces the safe clearance to less than the safe limit of approach distances.
- 4.6 To maintain minimum safe clearances:
 - 4.6.1 Install warning devices and signs (hang a sign from and mark all guy wires to warn traffic of low clearance; provide warning signage for all overhead services).
 - 4.6.2 Install telescopic, nonconductive posts and flagging across right-of-way at the minimum allowable clearance as allowed by regulations for the line voltage.
 - 4.6.3 Position signs or other devices to determine the "Danger Zone."
 - 4.6.4 Inform all on-site staff with the on-site clearances required.
 - 4.6.5 Beware of atmospheric conditions, such as temperature, humidity, and wind, that may dictate more stringent safety procedures.
- 4.7 Operation of heavy equipment and cranes in areas with overhead power lines represents a significant hazard to all personnel on the job site. Accidental contact with an energized line or arcing between a

high power line and grounded equipment can cause electrocution of equipment operators or nearby ground personnel, and damage to power transmission and operating equipment. Although maintaining a safe distance from all energized lines is the preferred means for control of this hazard, site conditions may not always accommodate this. If work will (or may) occur within 50 feet of any energized line, the procedures outlined below will be observed.

- 4.8 Overhead power lines will be identified on each job site before the work commences. For each identified line, the **Project Manager** must determine whether it is energized (and the operating voltage for energized lines), and whether work operations will require that activities with heavy equipment (excavators, loaders, cranes, etc.) will occur within 50 feet (15.25 metres) of the line. Unless verified, it will be assumed that all lines are energized.
- 4.9 Safe working distance is the minimum distance that must be maintained between any energized electrical line and any part of the operating equipment to maintain adequate safety margins and is based on the line voltage of the power line. Figure 4-1 lists the line voltages in kilovolts and the Minimum Safe Work Distance in the United States and Figure 4-2 indicates the Nominal Phase to Phase voltage rating in kilovolts for Canada. The following safe working distance criteria will be applied for all AECOM operations:

Figure 4-1: United States Overhead Line Criteria

Line Voltage (Kilovolts)	Minimum Safe Working Distance
0 – 50	10 feet
>50 – 200	15 feet
>200 – 350	20 feet
>350 – 500	25 feet
>500 – 750	35 feet
>750 – 1,000	45 feet

Source: American National Standards Institute, Publication B30.5.

Figure 4-2: Canadian Overhead Line Criteria

Column 1	Column 2
Nominal phase-to-phase voltage rating	Minimum Distance
Over 425 to 12,000	3.0 metres
Over 12,000 to 22,000	3.0 metres
Over 22,000 to 50,000	3.0 metres
Over 50,000 to 90,000	4.5 metres
Over 90,000 to 120,000	4.5 metres
Over 120,000 to 150,000	6.0 metres
Over 150,000 to 250,000	6.0 metres
Over 250,000 to 300,000	7.5 metres
Over 300,000 to 350,000	7.5 metres
Over 350,000 to 400,000	9.0 metres

Source: Canada Occupational Health and Safety Regulations Electrical Safety- Subsection 8.5(6).

- 4.10 Under no circumstances will any object pass closer than 3 metres to any energized, uninsulated electrical line.
- 4.11 Formally notify all subcontractors of Overhead Power lines with the attached *S3NA-406-FM Overhead Electrical Lines Acknowledgement* form.
- 4.12 **Acceptable Safety Procedures**
- 4.12.1 Where any work task will not allow the minimum safe working distance to be maintained at all times, an alternate means of protection must be identified and approved by the **SH&E Department**. In order of preference, acceptable procedures are
- De-energize the power line(s)/lockout by local utility authorities
 - Install insulated sleeves on power lines
 - Assign line spotters to assist the equipment operator
- 4.12.2 De-energize Power Lines
- Elimination of electrical power provides the most acceptable means of ensuring safety of personnel. While temporary site power lines are under the control of the site manager (and can be de-energized locally), electrical distribution and transmission lines can be de-energized only by the owner of the line (generally the local electrical utility). Therefore, de-energizing of a line requires advance coordination with the line owner; generally, at least one week advance notice should be provided.
- 4.12.3 Install Insulating Sleeves
- Insulating sleeves can be placed over power lines to provide a contact and arcing barrier if work must occur closer to the power lines than the accepted safe work distance. Although not as desirable as line de-energizing, the use of these sleeves can provide an acceptable alternative where electrical lines are required to remain in service.
 - As with de-energizing of distribution and transmission lines, placement of insulating sleeves can be performed only by the line owner. This requires advance coordination with the line owner; generally, at least one week advance notice should be provided. To install the sleeves, representatives of the line owner will require access to the job site.
- 4.12.4 Assign Line Spotters
- A line spotter is a person located at ground level who is assigned to observe equipment operations, with the specific duty of assisting the equipment operator to ensure that no part of the equipment gets too close to an energized, unprotected electrical line.
 - Persons assigned to act as line spotters must meet the following requirements:
 - While acting as a line spotter, no other duties may be performed (e.g., the line spotter cannot also act as the load spotter during a lifting operations).
 - The spotter will have a radio or other direct means of communicating with the equipment operator at all times.
 - The spotter will be positioned at a right angle to the equipment operator's line of sight to maximize the sight angles between the personnel.
- Under no circumstances will any portion of a piece of equipment pass closer than 10 feet to any energized, uninsulated electrical line.**
- 4.13 **Additional Safety Measures**
- 4.13.1 The following additional safety measures can be implemented as needed when working around energized power lines:
- Provide equipment with proximity warning devices. These provide an audible alarm if any part of the equipment gets too close to a line.
 - Install ground safety stops. These prevent vehicles from accidentally entering hazardous areas.
 - Equip cranes with a boom-cage guard. This prevents the boom from becoming energized if an electrical line is contacted.
 - Utilize insulated links and polypropylene tag lines. These prevent the transmission of electricity to loads or tag line handlers if an electrical line is contacted.

NOTE: These additional safeguards are intended as supplemental protection. Use of these measures is not permissible as a substitute for maintaining the safe working distance or implementation of the procedures in Section 4.1.

4.13.2 If an electrical power line is hit or an electrical arc occurs:

- All ground personnel must evacuate IMMEDIATELY to a distance of at least 50 feet (15.25 metres). DO NOT attempt to rescue any injured person until the line can be de-energized.
- The operator should remain in the cab until the line can be de-energized and should carefully try to extricate the equipment from the power line. This may not be possible where melting of insulator material or metal has occurred.
- Contact the line owner to report the line contact and request that the line be de-energized immediately.
- Once the line has been confirmed to be de-energized, the operator can safely evacuate the cab and rescue can commence for any injured personnel.
- Contact the **SH&E Department** to report the incident and implement any instructions provided.
- If the operator must evacuate while the line is still energized (because of fire or other life-threatening condition) he/she should jump clear of the equipment (making sure to avoid touching the equipment and the ground simultaneously), and land upright and with feet together. Once on the ground, proceed in a direct line away from the equipment using a short, shuffling gait (feet touching, sliding each foot no more than 1 foot forward at a time) to minimize shock hazard from electrical energy being transmitted through the ground.

Project name:		
AECOM contact name:		
Acknowledgement		
I acknowledge that I have received a copy of the <i>S3NA-406-PR Electrical Lines, Overhead</i> , I understand that this project site may have Overhead Electrical Hazards, and I have discussed this procedure with all of our company staff who will be on this site.		
Name and Title (Print)	Signature	Date

S3NA-417-PR Utilities, Underground

1.0 Purpose and Scope

- 1.1 Establishes requirements to ensure that underground installations are identified properly before excavation work commences.
- 1.2 This procedure applies to all AECOM North America-based employees and operations.

2.0 Terms and Definitions

- 2.1 **Underground Utilities:** All utility systems located beneath grade level, including, but not limited to, gas, electrical, water, compressed air, sewage, signaling and communications, etc.
- 2.2 **Ground Disturbance (GD):** Any indentation, interruption, intrusion, excavation, construction, or other activity in the earth's surface as a result of work that results in the penetration of the ground.

3.0 Attachments

- 3.1 S3NA-417-FM Identifying Underground Installations Checklist
- 3.2 S3NA-417-WI One Call System Definition and Directory
- 3.3 S3NA-417-ST Underground Utilities

4.0 Procedure

- 4.1 Ground disturbance may be conducted for a variety of purposes, including, but not limited to, exposing existing buried lines, soil sampling, remedial excavations, or installing monitoring wells or test pits.
- 4.2 Improper ground disturbance may impact a buried pipeline or utility line and cause a major release of a hazardous substance, flood, or electrocution. Serious injuries and significant property damage have resulted from insufficient/inadequate identification of underground installations during the course of ground disturbance work.
- 4.3 To control hazards associated with coming in contact with such installations, the American Public Works Association's (APWA) guidelines for the uniform identification of underground installations has been adopted.
- 4.4 **Project Managers** are responsible for ensuring that all work, including the identification, location, and access to all underground utilities, is planned and performed in accordance with contract specifications and safety requirements.
 - 4.4.1 The planning for associated work and avoidance of contacting underground utilities shall be part of the project safety planning in the HASP.
- 4.5 The **Lead Site Manager or Supervisor** is responsible for the execution of work in accordance with this and other associated AECOM SOPs, including:
 - The review of the HASP.
 - Verification that all steps have been taken to identify existing underground utilities in the area to be disturbed.
- 4.6 **Region SH&E Manager** provides guidance as needed.
- 4.7 **Personal Protective Equipment**
 - Long sleeved shirt and pants (coveralls/Nomex LILA for upstream oil and gas)
 - Safety toe boots
 - Hard hat
 - High-visibility clothing
 - Gloves
 - Respirator with organic vapor/particulate filter cartridge (for use when the exposure exceeds the occupational exposure limit stated on the MSDS), as required

S3NA-418-PR Welding, Cutting, and Other Hot Work

1.0 Purpose and Scope

- 1.1 Establishes the minimum requirements for welding, cutting, and hot work activities.
- 1.2 This procedure applies to all AECOM North America-based employees and operations.
- 1.3 AECOM employees shall not operate a welder's torch; however, AECOM may oversee subcontractors who conduct welding, and therefore the requirements for hot work would still apply on our job sites and still require a permit. Other AECOM activities may also trigger the need for a Hot Work Permit and procedure (for example, engine ignition in flammable atmospheres).

2.0 Terms and Definitions

- 2.1 **Class 1 Area:** Any area in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitable mixtures.
 - 2.1.1 Guidance to identify Class 1 can be provided by area classification diagrams (as presented in the IM website) and by standards such as the following:
 - American Petroleum Institute, API Recommended Practice 500, Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2, 2nd ed., November 1997.
 - BP GP 44-60, Guidance on Practice for API RP 500 Area Classification.
 - National Fire Protection Association 70™ National Electric Code®
- 2.2 **Class 1, Division 1:** Refers to the designation and classification of specific hazardous environments in the National Electrical Code (NEC). A Class I Hazardous Location is one in which flammable gases or vapors may be present in the air in sufficient quantities to be explosive or ignitable. Refer to local regulations, Occupational Safety and Health Administration (OSHA) and NEC for information about this type of hazardous area. Dusts or fibers may also produce explosive or ignitable conditions.
- 2.3 **Combustible Material:** Any material that may ignite when introduced to an ignition source (e.g., wood, paper, cardboard and plastic).
- 2.4 **Hot Work:** A work activity that by the nature of the operation (e.g., grinding, burning thermo cutting/welding, brazing, etc.) creates an open source of ignition or that could produce temperatures high enough to cause the ignition of flammable gases and combustible materials
- 2.5 **Hot Work Control Areas:** Fire-hazardous areas such as cable-spreading rooms, cable trays, conveyor galleries, rubber-lined piping equipment and structures, potentially explosive atmospheres, and similar hazardous hot work areas identified by project safety personnel.
- 2.6 **Hot Work Permit:** Document issued prior to the start of hot work, which is used to verify the presence of appropriate fire prevention and protection measures.
- 2.7 **Primary Source Ignition (PSI) Hot Work:** Any work with equipment and tools that are likely to ignite a flammable or combustible atmosphere, solid materials and liquids when used in a normal manner. Primary Source Ignition (PSI) hot work is often referred to as 'naked flame' hot work. High energy is present in the form of a flame, electric arc or incandescent sparks.
 - 2.7.1 Examples of PSI hot work include, but are not limited to, the following:
 - Welding and burning.
 - Grinding.
 - Torch cutting and soldering.
- 2.8 **Secondary Source Ignition (SSI) Hot Work:** Any work with equipment and tools that may create low-energy sparks and ignite a flammable or combustible atmosphere when used in a normal manner or due to errors or malfunction. Secondary source ignition (SSI) hot work is also referred to as 'spark potential' hot work.

- 2.8.1 Examples of SSI hot work include, but are not limited to, the following:
- 2.8.2 Sandblasting.
- 2.8.3 Using electrical and electronic equipment that is not intrinsically safe or explosion-proof (e.g., most electronic communication devices, flashlights).
- 2.8.4 Using spark-ignition engines (including vehicles) in a Class 1 area (e.g., vehicle entry into tank dike).
- 2.8.5 Using a rotating steel brush.
- 2.8.6 Electrical isolation testing.
- 2.8.7 Producing a friction spark, typically from a rusty surface.
- 2.9 **Sources of ignition:** In locations where flammable vapors may be present, precautions shall be taken to prevent ignition by eliminating or controlling sources of ignition. Sources of ignition may include open flames, lightning, smoking, cutting and welding, hot surfaces, frictional heat, sparks (static, electrical, and mechanical), spontaneous ignition, chemical and physical-chemical reactions, and radiant heat.

3.0 Attachments

- 3.1 S3NA-418-FM Hot Work Permit
- 3.2 S3NA-418-GL Hot Work Permit Applicability
- 3.3 S3NA-418-ST Welding, Cutting and Other Hot Work

4.0 Procedure

4.1 Roles and Responsibilities

4.1.1 Hot Work Operator

- In the scope of this procedure, a **Hot Work Operator** is defined as an individual who operates hot work equipment to perform hot work operations.
- The **Hot Work Operator** shall perform the following duties:
 - Know and apply applicable company and regulatory policies, standards and procedures related to hot work operations.
 - Participate in the inspection of welding and burning equipment and work areas.
 - Participate in the completion of and sign the Hot Work Permit to acknowledge his or her understanding of the conditions documented on the permit.
 - Comply with the conditions of the issued Hot Work Permit.
 - Safely handle hot work equipment and processes.
 - Cease hot work operations if unsafe conditions develop and notify the Field Task Manager immediately for evaluation and appropriate action.

4.1.2 Project Manager, Field Task Manager, Supervisor

- Assures that AECOM employees receive the specified level of protection as to project welding, cutting and burning activities.
- Assures that a Hot Work Permit is issued and all control measures are maintained.

4.1.3 Authorized Air Monitor

In the scope of this procedure, the **Authorized Air Monitor** is an individual responsible for operating air-monitoring equipment to monitor the presence of flammable gas in the area where hot work is planned.

- The **Authorized Air Monitor** may also be the **fire watch** under certain conditions specified in Section B – **Fire Watch** of the Hot Work Permit.
- The **Authorized Air Monitor** shall not be a **hot work operator** during primary source ignition (PSI) hot work but may be a **hot work operator** during secondary source ignition (SSI) Class 1 hot work.
- The **Authorized Air Monitor** will sign as a performing authority on the Permit Cover Sheet indicating their role.

- The **Authorized Air Monitor** shall perform the following duties:
 - Verify that the air monitoring device to be used is calibrated according to the manufacturer's instructions and that calibration information is documented in Section A – Atmospheric Monitoring of the Hot Work Permit.
 - Perform initial air monitoring of the hot work area for the presence of flammable gas.
 - Perform continuous air monitoring for the presence of flammable gas between the hot work and potential vapor sources.
 - Verify that a Lower Explosive Limit (LEL) Mitigation Plan, according to Lower Explosive Limit Mitigation Plan of this procedure, is developed and documented in Section E - LEL Mitigation Plan of the Hot Work Permit if initial or continuous air monitoring detects the presence of flammable gas (LEL is greater than 0 percent).
 - Verify that the LEL Mitigation Plan is implemented and flammability is controlled to less than 10 percent of the LEL before allowing hot work to proceed. (Refer to Lower Explosive Limit Mitigation Plan).
 - Stop all hot work if any air monitoring reading is greater than 10 percent of the LEL.

NOTE Refer to Air Monitoring (Class 1 Areas) of this practice for additional information regarding the **Authorized Air Monitoring** and air monitoring requirements.

4.1.4 Fire Watch

- In the scope of this procedure, the **Fire Watch** is responsible for monitoring hot work and the surrounding area for incipient fires and changing conditions. The **fire watch** may also be the **authorized air monitor** under certain conditions specified in Section B – **Fire Watch** of the Hot Work Permit.
- The **Fire Watch** shall not be a **hot work operator**. If simultaneously performing the **authorized air monitor** role, the **fire watch** shall not have any additional roles. The **Fire Watch** shall not have any other duties besides those specified in this procedure during the hot work activities and for 30 minutes afterwards.
- The **Fire Watch** shall perform the following duties:
 - Understand the location, nature and hazards of the hot work to be performed.
 - Survey the area to verify that the necessary fire protection equipment is in place and ready for use.
 - Confirm that safe conditions are maintained during hot work operations.
 - Make fire-extinguishing equipment readily available and be trained in its use.
 - Remain within communication range of the person(s) performing the hot work and maintain a line of sight with the hot work.
 - Not leave the area for any reason without a replacement or stopping the hot work.
 - Watch for fires in all areas exposed to hot work and communicate to **hot work operators** to cease all hot work if a fire occurs.
 - Try to extinguish a fire only when the fire is obviously within the capacity of the equipment available.
 - Sound the alarm (e.g., air horn) and implement evacuation procedures immediately if he or she determines that a fire is not within the capacity of the available extinguishing equipment.
 - Remain in the hot work area at least 30 minutes after the hot work has ceased to detect and extinguish possible smoldering fires.

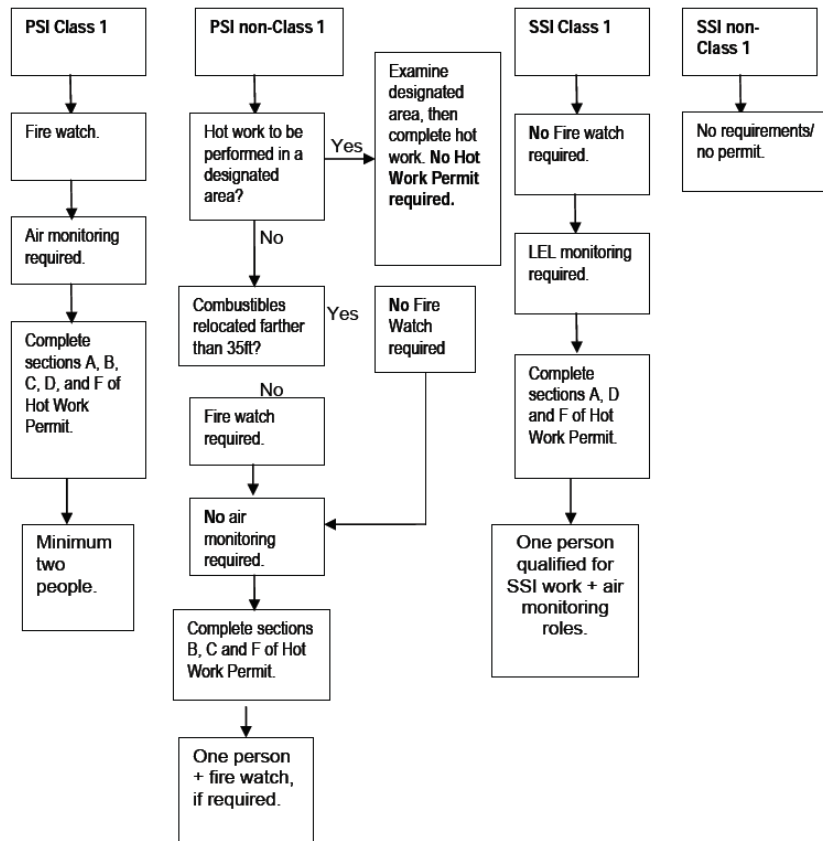

4.2 Performing hot work in classified and non-classified areas may be considered a hazardous activity, and a Hot Work Permit may be required. The Hot Work Permit has five purposes:

- 4.2.1 To serve as written permission to do the work.
- 4.2.2 To provide a minimum safety checklist.
- 4.2.3 To show the steps necessary for making the work site safe for conducting hot work.
- 4.2.4 To alert operating personnel to the work in progress.
- 4.2.5 To provide a record of safety steps taken for contract work.

- 4.3 S3NA-418-GL *Hot Work Permit Applicability* provides guidelines for determining whether a Hot Work Permit is required.
- 4.4 Occasionally AECOM staff may be working in the vicinity of welding operations. Exposure to welding operations can result in eye damage, burns, or respiratory illness.
- 4.5 Engineering controls will be implemented to control hot work hazards to the extent feasible.
- 4.6 Equipment will be used only for operations for which it is approved and as recommended by the manufacturer. Employees assigned to operate or maintain oxygen/fuel-gas supply equipment and resistance welding equipment will be thoroughly instructed in the safe use of such equipment by a qualified person.
- 4.7 Before any cutting or welding is performed, the area will be evaluated for flammables or combustibles by the Issuing Authority responsible for authorizing hot work. Where hot work permits are used, all welding activities shall be controlled and isolated from flammables and combustibles.
- 4.8 Training shall be provided as to the use of Hot Work Permits to all associated workers.
- 4.9 **Hot Work Permit**
- 4.9.1 A Hot Work Permit shall be prepared before any PSI hot work (other than in a designated area) or any SSI Class 1 hot work is performed. Any volatile contaminants (surface or subsurface) on sites shall be evaluated to determine if the definition of Class 1 is met.
- 4.9.2 A Hot Work Permit is not required for SSI non-Class 1 hot work.
- 4.9.3 A Hot Work Permit is valid for no more than one work shift. If hot work is suspended during a shift, the permit shall be revalidated before further hot work can continue. Revalidation involves inspecting the hot work area for any change in previous conditions and conducting air monitoring if the hot work is performed in a Class 1 area.
- 4.9.4 Individuals who have the technical and procedural competencies as defined by AECOM and their roles within the Hot Work activity will provide input to the permit as necessary to address all hazards and permit conditions related to the hot work.

	Class I	Non Class I
PSI hot work	<ul style="list-style-type: none"> • Permit  • Air monitor • Fire Watch 	<ul style="list-style-type: none"> • Permit  • <u>No</u> Air monitor • Fire Watch
SSI Hot Work	<ul style="list-style-type: none"> • Permit  • Air monitor • <u>No</u> Fire Watch 	<ul style="list-style-type: none"> • <u>No</u> Permit  • <u>No</u> Air monitor • <u>No</u> Fire Watch

4.9.5 Hot Work Permit Applicability

4.10 Non-Permissible Areas

4.10.1 All hot work is prohibited in areas not authorized by facility management and the following areas:

- Sprinkler-equipped buildings where sprinklers are impaired, unless the requirements of NFPA 25 are met.
- In the presence of explosive atmospheres (greater than or equal to 10 percent of the LEL).
- In the presence of unclean or improperly prepared tanks, vessels or other containers and equipment that have previously contained flammable or combustible materials when their contents may be exposed to an ignition source.

4.11 Preparation for All Primary Source Ignition (PSI) Hot Work

4.11.1 PSI hot work designates any work with equipment and tools that, when used in a normal manner, are likely to ignite a flammable or combustible atmosphere, solid materials and liquids.

4.11.2 PSI hot work, such as grinding, has been known to generate sparks with enough force to transport them up to 35' (10.67m) from the point of the hot work; therefore, it is possible to perform PSI hot work up to 35' (10.67m) away from a Class 1 location and yet still introduce an ignition source into a Class 1 area.

4.11.3 Prior to performing PSI hot work, the requirements presented in this section shall be met and shall be verified by the permit writer:

- The hot work equipment shall be in satisfactory operating condition and in good repair.
- All combustible and flammable materials shall be relocated at least 35' (10.67m) in all directions from the work site.

4.11.4 If relocating these materials is impractical, the following precautions shall be taken:

- The materials shall be shielded with fire-retardant covers or with metal or fire-retardant guards or curtains.
- The edges of covers at the floor shall be tight to prevent the entrance of sparks, including at the point where several covers overlap when a large pile is being protected.
- A **fire watch** may be required.

- 4.11.5 NOTE: Consideration should be given to spark-containment techniques that lessen the distance sparks are able to travel freely (e.g., fire-retardant screens, guards, spark/slag catcher).
- A fully charged and operable fire extinguisher appropriate for the type of potential fire shall be available for use in the work area (20lbs [9.07kg] minimum).
 - A nonflammable, impervious material shall seal sewer openings, ducts and drains. Where sealing is insecure or impractical, water spray or stream should be directed across openings.
 - The location of the hot work relative to combustible and flammable materials and classified areas shall determine the need for a **fire watch**, as outlined in this practice. Personnel within the vicinity of the hot work shall be suitably protected against such dangers as heat, sparks, flash and slag.
- 4.12 **Preparation for Primary Source Ignition (PSI) Class 1 Hot Work**
- 4.12.1 Prior to performing any PSI Class 1 hot work, the requirements set in Preparation for all Primary Source Ignition Hot Work of this procedure, this section and the relevant requirements of Air Monitoring of this practice shall be met and verified by the permit writer.
- A **fire watch** shall be assigned for the duration of the hot work and for 30 minutes after the hot work is completed to detect and extinguish any smoldering fires.
 - The venting, draining or bleeding of flammable or combustible liquids and gases shall be stopped within 35' (10.67m) of the hot work.
 - Affected excavations, conduits and manholes within 35' (10.67m) of the hot work shall either be monitored for the presence of flammable gas or sealed to confirm that an ignition source is not introduced.
 - Initial and continuous air monitoring shall be performed and documented on the Hot Work Permit. (Refer Air Monitoring [Class 1 Areas] of this practice.)
- 4.12.2 NOTE Non-intrinsically safe tools (including cell phones) are prohibited from use in Class 1 areas, except as defined in Initial and Continuous Hot Work Air Monitoring, regarding SSI Class 1 Hot Work.
- 4.13 **Preparation for Primary Source Ignition (PSI) Hot Work within 35' (10.67m) of Buildings or Other Structures**
- 4.13.1 The conditions in Preparation for all Primary Source Ignition Hot Work and this section shall be met and verified before any PSI hot work is performed inside or within 35' (10.67m) of buildings or structures with building materials or contents that may be combustible or flammable.
- Openings or cracks in walls, floors or ducts within 35' (10.67m) of the hot work shall be tightly covered with fire-retardant or noncombustible materials to prevent the passage of sparks to adjacent areas.
 - Ducts that might carry sparks to distant combustible or flammable materials shall be shielded, shut or both.
 - If hot work is performed near walls, partitions, ceilings or roofs of combustible materials, fire-retardant shields or guards shall be provided to prevent ignition.
 - If hot work is done on one side of a wall, partition, ceiling or roof, combustibles on the other side shall be relocated if possible. If it is impractical to relocate combustibles, a **fire watch** shall be provided on the side of the combustibles.
 - Hot work shall not be attempted on a partition, wall, ceiling or roof with a combustible covering or insulation, or on walls or partitions of combustible sandwich panels or similar construction.
 - If the hot work is close enough to cause ignition by conduction, it shall not be performed on pipes or other metal that is in contact with combustible walls, partitions, ceilings roofs or other combustibles.
 - The following procedures shall apply to hot work performed in close proximity to a sprinkler head:
 - A wet rag shall be laid over the sprinkler head and then removed at the conclusion of the welding or cutting operation.
 - Special precautions (e.g., ventilation, shielding) shall be taken during the hot work to avoid accidental operation of automatic fire suppression systems.

4.14 Preparation for Secondary Source Ignition (SSI) Class 1 Hot Work

- 4.14.1 Secondary Source Ignition (SSI) Hot Work designates any work with equipment and tools that may create low-energy sparks and ignite a flammable or combustible atmosphere when used in a normal manner or due to errors or malfunction. Secondary source ignition (SSI) hot work is also referred to as 'spark potential' hot work.
- 4.14.2 Before any SSI Class 1 hot work is performed, initial air monitoring shall be performed and documented on the Hot Work Permit. (Refer to Initial Hot Work Air Monitoring [PSI Class 1] of this procedure.)
- 4.14.3 Periodic up to continuous air monitoring, as determined by the permit writer and documented on the Hot Work Permit Section D. – Area Monitoring Program, shall be performed and the results documented on the Section A – Atmospheric Monitoring on the Hot Work Permit.
- 4.14.4 Air monitoring equipment is to produce an audible alarm when LEL exceeds 10 percent. The **authorized air monitor** shall remain in hearing range of the audible alarm and locate the air monitoring equipment between the hot work and potential vapor source. More than one instrument may be needed to monitor the air properly.
- 4.14.5 NOTE: Non-intrinsically safe tools (including cell phones) are prohibited from use in Class 1 areas, except as defined in Initial and Continuous Hot Work Air Monitoring, regarding SSI Class 1 hot work.

4.15 Air Monitoring (Class 1 Areas)

- 4.15.1 Flammable and combustible liquids and gases are present in Class 1 areas. In order to perform hot work safely in these areas, initial and continuous air monitoring is required to confirm that any flammable gas in the work area is detected and properly controlled.
- 4.15.2 If the hot work will be performed in a tank or vessel, the air monitoring requirements for confined spaces will apply.
- 4.15.3 When the possibility exists for an oxygen-deficient atmosphere the oxygen level could be below the level required by the air monitor to give the correct flammability (LEL) reading. This could occur where a tank, vessel or piping contains an inert gas such as nitrogen or carbon dioxide. For this reason, it is important to monitor oxygen levels prior to monitoring for LEL.
- 4.15.4 General Requirements
- Hot work is prohibited if air-monitoring readings are greater than or equal to 10 percent of the LEL.
 - All air monitoring associated with hot work will be conducted by an **authorized air monitor** who is trained and competent in the use of the instrument and hazards of the monitored area.
 - The instrument(s) used for air monitoring shall be calibrated prior to use. The **authorized air monitor** shall maintain documentation of the calibrations in Section A – Atmospheric Monitoring of the Hot Work Permit.
- 4.15.5 Initial Hot Work Air Monitoring (Primary Source Ignition Class 1)
- Initial hot work air monitoring should be conducted as close to the start of the hot work as possible.
 - Initial air monitoring shall be conducted prior to the authorization and issuance of all Hot Work Permits for PSI Class 1 hot work.
 - Initial air monitoring shall be performed by an authorized gas tester surveying at least a 35' (10.67m) radius from the point of the hot work with a properly functioning, calibrated air monitor equipped with LEL and O₂ sensors.
 - For all PSI Class 1 hot work, initial air monitoring shall be done according to the Area Monitoring Program on the Hot Work Permit.
 - If initial air monitoring indicates the presence of any flammable gas, the hot work may not proceed until an LEL mitigation plan is developed, documented on Section E – LEL Mitigation Plan of the Hot Work Permit and implemented. (Refer to Lower Explosive Limit Mitigation Plan of this practice.)

4.15.6 Continuous Hot Work Air Monitoring (Primary Source Ignition Class 1)

- All PSI Class 1 hot work requires attended continuous air monitoring while the hot work is being performed. An authorized gas tester shall attend to the monitor and survey the perimeter of the permitted area at least once an hour. The survey shall cover at least a 35' (10.67m) radius from the point of the hot work.
- During drilling operations where the potential of flammable gas is known to exist or the potential of flammable gas exists, the borehole may be classified as a Class 1 area and continuous gas monitor will be used in the immediate proximity of the top of the hole.
- When not conducting a periodic perimeter survey, the authorized gas tester shall be primarily positioned between the hot work and any potential sources of flammable gas.

NOTE: The use of several air monitors around the hot work should be considered, depending on the work location. If more than one continuous monitor is in use, only one instrument needs to be actively attended.

- Readings from continuous air monitoring and hourly surveys need should be recorded on the Hot Work Permit even if the monitors do not alarm and the readings do not differ from the initial air monitoring results.
- If initial air monitoring readings are 0 percent LEL but continuous air monitoring indicates the presence of flammable gas (greater than 0 percent of the LEL), the hot work shall stop and an LEL mitigation plan shall be developed, documented, and implemented. (Refer to Lower Explosive Limit Mitigation Plan of this practice.)
- If the implementation of the LEL Mitigation Plan controls the flammability level to less than 10 percent of the LEL, the authorized gas tester will continue monitoring the area while hot work continues. If at any time the LEL reading reaches 10 percent, the hot work shall stop until the source of the flammable gas is controlled to less than 10 percent of the LEL.

4.15.7 Initial and Continuous Hot Work Air Monitoring (Secondary Source Ignition Class 1)

- Vehicles, mobile plant equipment and other non-intrinsically safe equipment present potential ignition sources. Consequently, SSI hot work in Class 1 areas (e.g., a tank dike) requires the completion of a Hot Work Permit and the performance of air monitoring.
- Air monitoring shall be performed for SSI hot work in Class 1 areas:
 - Before a vehicle or equipment that is not intrinsically safe is allowed to enter the Class 1 area, an authorized gas tester shall survey the area along its planned path to its destination.
 - The vehicle or equipment can proceed into the classified area only when flammability readings are 0 percent LEL, or less than 10 percent of the LEL with an implemented LEL mitigation plan.
- Continuous air monitoring shall be performed as long as the vehicle's engine or non-intrinsically safe equipment is running and initial monitoring is greater than 0 percent.
- If the vehicle or non-intrinsically safe equipment is shut off, it shall not be restarted until the area around the vehicle or non-intrinsically safe equipment is surveyed for flammable gas.
- The planned egress of the vehicle or equipment from the Class 1 area shall be surveyed for flammable gas prior to its departure from the area.
- Periodic up to continuous air monitoring, as determined by the risk assessment, shall be performed and documented on the Hot Work Permit.

4.15.8 Area Monitoring Program

- An Area Monitoring Program shall be developed before any Class 1 hot work is performed.
- The following information, which is documented in Section D of the Hot Work Permit, shall be included in the Area Monitoring Program:
 - The area where the hot work will be performed, including the specific points where the hot work will be performed.
 - All hot work equipment (ignition sources) and all potential sources of flammable gas within 35' (10.67m) of the hot work. Examples of potential sources of flammable gas include sumps, drains, flanges, valves, liquid boots, excavations and all confined areas and equipment located within them, such as floating roof pontoons, piping, excavations, vessels and boreholes or wells with potentially flammable gases.
 - The area that will be monitored by the authorized gas tester. At a minimum, this includes a 35' (10.67m) radius from the point of the hot work. Hot work in a confined space requires air monitoring for flammable gas throughout the entire space. (Refer to the Confined Space

Defined Practice.)

4.16 **Lower Explosive Limit Mitigation Plan**

4.16.1 Section E of the Hot Work Permit documents the location of confirmed sources of flammable gas and the controls needed to reduce the LEL reading to less than 10 percent of the LEL.

4.16.2 An LEL mitigation plan shall be developed and implemented if the presence of flammable gas is detected (LEL greater than 0 percent) at any time during the hot work.

4.16.3 The following information shall be documented in Section E of the Hot Work Permit:

- The percent of the LEL that was measured.
- The identified source(s) of the flammable gas within the hot work area.
- The controls, if any, that will be implemented to effectively reduce the flammability level to less than 10 percent of the LEL within the hot work area.
- The percent LEL measured after controls, if any, have been implemented.

If at any time the LEL reading is greater than or equal to 10 percent of the LEL, the hot work will stop immediately and will not resume until controls are implemented to reduce the LEL level to less than 10 percent of the LEL.

4.17 **Fire Watch**

4.17.1 A **fire watch** is required whenever the hot work meets any of the following criteria:

- The hot work consists of PSI Class 1 hot work.
- The PSI hot work will be performed:
 - Within 35' (10.67m) of shielded combustible material.
 - Within a 35' (10.67m) radius of wall or floor openings that expose combustible materials.
- Adjacent to metal partitions, walls, ceilings or roofs that are in contact with combustible materials on the other side and are likely to be ignited by conduction or radiation.
- Where fire alarms or suppression systems have to be disabled.

4.17.2 The **fire watch** shall be in the ready position at all times while hot work is being performed. The ready position consists of the following:

- Being attentive to the hot work being performed.
- Properly positioning the fire extinguisher prior to the start of work.
- Always maintaining a line of sight to the hot work being performed.

4.17.3 The **fire watch** shall stop the work if he or she deems that:

- Unsafe conditions have developed.
- The work is exceeding the scope described in the Hot Work Permit.

4.17.4 When required, a **fire watch** will be maintained for at least 30 minutes after completion of welding/cutting operations so that possible smoldering fire can be detected and extinguished.

4.17.5 Firewatchers will have fire-extinguishing equipment readily available and be trained in its use.

4.17.6 They will be familiar with facilities and procedures in the event of a fire. They will watch for fires in all exposed areas and attempt to extinguish them only when obviously within the capacity of the equipment available. The Fire Department will be immediately notified of all fires.

4.17.7 A second **fire watch** shall be required if one **fire watch** cannot directly observe combustible materials that could be ignited by the hot work operation.

4.18 **Welding and Cutting General Requirements**

4.18.1 Equipment will be used only for operations for which it is approved and as recommended by the manufacturer.

4.18.2 Employees assigned to operate or maintain oxygen/fuel-gas supply equipment and resistance welding equipment will be thoroughly instructed in the safe use of such equipment by a qualified person.

- 4.18.3 Engineering controls will be implemented to control hot work hazards to the extent feasible.
- 4.18.4 Before any cutting or welding is performed, the area will be evaluated for flammables or combustibles by the Supervisor responsible for authorizing hot work.
- 4.18.5 A written Hot Work Permit (Attachment 1 or the equivalent) may be required by clients particularly in process plant facilities based on conditions or on projects that AECOM controls. In the latter case, the PM or site lead manager should review any Contractor/Subcontractor Hot Work permits issued.
- 4.18.6 Where hot work permits are used, all welding activities shall be controlled and isolated from flammables and combustibles.
- 4.18.7 Avoid looking directly at the welding arc.
- 4.18.8 Avoid prolonged exposure to welding/paint fumes.
- 4.18.9 Avoid touching recently welded joints.
- 4.18.10 Employees should see a Doctor if irritation or “red eye” occurs as a result of welder’s flash. Symptoms include:
- Pain that may be mild to very severe
 - Bloodshot eyes
 - Light sensitivity
 - Watery eyes
 - Blurred vision
 - The feeling of having something in your eye
- 4.18.11 Employees should seek urgent medical help if any of the following symptoms are experienced:
- Blurred vision
 - Vision changes
 - Seeing spots or flashes of light
 - Pain when moving your eyes
 - Worsening pain
- 4.19 **Gas Welding and Cutting Safety**
- 4.19.1 Fuel-gas hoses and oxygen hoses will be easily distinguishable from each other. The contrast will be made by different colors or by surface characteristics readily distinguishable by touch. Oxygen and fuel-gas hoses will not be interchangeable. A single hose having more than one gas passage will not be used.
- 4.19.2 When parallel sections of oxygen and fuel-gas hose are taped together, not more than 4 inches out of 12 inches will be covered by tape.
- 4.19.3 All hoses in use will be inspected at the beginning of each work shift. Defective hose will be removed from service.
- 4.19.4 Hoses, cables, and other equipment will be kept clear of walkways, ladders, and stairs.
- 4.19.5 Clogged torch tip openings will be cleaned with approved cleaning wires, drills, or other devices designed for this purpose.
- 4.19.6 Torches to be used will be inspected at the beginning of each work shift for leaking shutoff valves, damaged hose couplings, and clogged tip connection. Defective torches will not be used.
- 4.19.7 Torches will be ignited by friction lighters or other approved devices only. Matches, flame lighters, or hot work will not be used to ignite a torch.
- 4.19.8 Oxygen and fuel-gas pressure regulators, including related gauges, will be in proper working order and equipped with “Flashback” arrestors attached to the gauges. NOTE: Flashback arresters are in addition to “Backflow” devices.
- 4.19.9 All oxygen cylinders and fittings will be kept away from oil or grease. Cylinders, cylinder caps and valves, couplings, regulators, hose, and apparatus will be kept free from oil or greasy substances and

will not be handled with oily hands or gloves. Oxygen will not be directed at oily surfaces or greasy clothes, or used within a fuel oil or other storage tank or vessel.

- 4.19.10 Torches and hoses will be completely depressurized (bled) of pressurized gas, prior to storage, or at the end of each shift.
- 4.19.11 Torches and hoses will not be stored in enclosed areas (e.g., gang boxes, lockers) while connected to cylinders and gauges will be removed at the end of shift.
- 4.19.12 Oxygen connections will include a means to prevent backflow.
- 4.19.13 Fuel gas cylinders will be provided flashback protection.

4.20 **Arc Welding and Cutting Safety**

- 4.20.1 Electrode holders which are designed for arc welding/cutting and are capable of safely handling the maximum rate current will be used.
- 4.20.2 Any current-carrying parts passing through the holder which the arc welder or cutter grips in his/her hand, or the outer surfaces of the jaws of the holder, will be fully insulated against the maximum voltage encountered and properly grounded.
- 4.20.3 All arc welding/cutting cables will be completely insulated and flexible, capable of handling the maximum current requirements of the work.
- 4.20.4 Only cables free from repair or splices for a minimum distance of 10 feet from the electrode holder will be used. Cables with standard insulated connectors or splices with insulating quality that is equal to that of the cable are permitted.
- 4.20.5 If it is necessary to splice lengths of cable, insulated connectors equivalent to that of the cable will be used. If connections are made by cable lugs, they will be securely fastened together and provide a good electrical contact. Exposed metal parts of the lugs will be completely insulated.
- 4.20.6 If electrode holders are left unattended, the electrodes will be removed and the holder placed so that they cannot make electrical contact with employees or conducting objects.
- 4.20.7 To avoid the possibility of electric shock, electrode holders will not be dipped in water.
- 4.20.8 When the arc welder or cutter leaves work, stops work for any length of time, or when the arc welding cutting machine is to be moved, the power supply to the equipment will be turned off.
- 4.20.9 Any faulty or defective equipment will be reported to the supervisor and tagged out of service until repaired.
- 4.20.10 All arc welding/cutting operations will be shielded by noncombustible or flameproof screens to protect employees and other persons working in the vicinity from the direct ray of the arc.

4.21 **Storage and Handling of Compressed Gas Cylinders**

- 4.21.1 Compressed gas cylinders will be legibly marked with either the chemical or trade name of the gas. Such markings will be stenciled, stamped, or labeled and will not be easily removable.
- 4.21.2 The marking will be located on the shoulder of the cylinder.
- 4.21.3 Compressed gas cylinders will be equipped with approved connections
- 4.21.4 Acetylene cylinders will be stored and used valve end up.
- 4.21.5 Cylinders will not be stored near highly combustible/flammable materials, especially oil or grease.
- 4.21.6 Cylinders will be stored in an upright and secure position with caps installed and separated from fuel-gas cylinders or combustible materials (especially oil or grease), by a minimum distance of 20 feet, or by a noncombustible barrier at least 5 feet high and having a fire resistance rating of at least one half hour.
- 4.21.7 Cylinders will be not dropped, struck by objects, or permitted to strike each other violently.
- 4.21.8 Cylinder valves will be closed and gauges removed before moving cylinders
- 4.21.9 Cylinder valves will be closed and gauges removed at the end of the shift or when work is finished.
- 4.21.10 Valves of empty cylinders will be closed.

- 4.21.11 Cylinders will be kept far enough away from the actual welding/cutting operation so that sparks, hot slag, or flames will not reach them.
- 4.21.12 Cylinder valves will always be opened slowly.
- 4.21.13 An acetylene cylinder valve will not be opened more than one and one-half turns of the valve stem and preferably no more than three-fourths of a turn.
- 4.21.14 Where a special wrench is required to operate a cylinder valve, it will be left in position on the stem of the valve while the cylinder is in use. In the case of manifolded or coupled cylinders, at least one such wrench will be available for immediate use.
- 4.21.15 Regulators will be removed, valve caps in place, and valves closed when cylinders are transported by vehicles. All vehicles used to transport cylinders will have a proper support rack installed.
- 4.21.16 A suitable cylinder truck, chain, or other steadying device will be used to prevent cylinders from being knocked over while in use or storage.
- 4.21.17 Cylinders will not be placed where they may become part of an electric circuit. Tapping of an electrode against a cylinder to strike an arc will be prohibited.

4.22 Personal Protective Equipment

4.22.1 Selection and Use

- Selection and use of personal protective equipment will comply with *S3NA-208-PR Personal Protective Equipment Program*
 - If you are required to observe the welding operation, use welder's helmet fitted with a filter shade that is suitable for the type of welding that is being performed.
 - If you are required to observe the chipping and grinding operation, use coated safety goggles or safety glasses with both UVA and UVB radiation protection.
 - Contact lenses should not be worn if there is a potential exposure to dust particles or chemicals that can irritate the eye.

4.22.2 Eye and Face Protection

- Eye and face protection will comply with the following:
 - Welding helmets and hand shields will be used during all arc welding/cutting operations, excluding submerged arc welding. Cutting/welding goggles will also be worn during arc welding/cutting operations. The goggles or glasses may be either clear or colored glass, depending on the type of exposure in welding operations. Helpers or attendants will wear proper eye protection.
 - Safety goggles or other approved eye/face protection are for use during gas welding operations on light work, torch brazing, or inspection.
 - All operators and attendants on resistance welding or brazing equipment will use face shields or goggles, depending on the particular job.

4.22.3 Protective Clothing

- Hot work will require the following protective clothing:
 - Except when engaged in light work, all welders will wear flameproof gauntlet gloves.
 - Flameproof aprons made of leather, or other suitable material, may also be desirable for protection against radiated heat and sparks.
 - Woolen clothing will be worn in preference to cotton because it is not so readily ignited. Nylon clothing is not permitted for welding/cutting operations. All outer clothing, such as jumpers or overalls, will be reasonably free from oil or grease.

4.22.4 Respiratory Protective Equipment

- Respiratory protective devices will be required when one or more of the following conditions exist:
 - Feasible engineering controls are insufficient to mitigate the hazards.
 - Room size (with special regard to ceiling height) is limited, or welding/cutting work is extensive and ventilation is limited.
 - Several welders are working in the area at the same time.
 - Potentially unsafe atmospheric conditions exist.

- Too much heat is generated.
- Hazardous fumes, gases, or dusts of toxic metals, particularly lead, cadmium, chrome, beryllium, and zinc are present in the base metal or in coatings.
- Respiratory protective equipment will be selected, used, and maintained in accordance with SH&E 115 – Respiratory Protection.

4.22.5 Mechanical Ventilation

- Mechanical ventilation will consist of either general dilution systems or local exhaust systems. Local exhaust systems are preferred.
- General mechanical ventilation will be of sufficient capacity and so arranged as to produce the number of air changes necessary to maintain welding fume and smoke within safe limits.
- General ventilation may not be used as the only means of control when toxic metals are involved in the operation.
- Local exhaust ventilation will consist of freely movable hoods intended to be placed by the welder or burner as close as practicable to the work. This system will be of sufficient capacity and so arranged as to remove fumes and smoke at the source and keep the concentration of them in the breathing zone within safe limits
- Contaminated air exhausted from a working space will be discharged into the open air or otherwise clear of the source of intake air. Environmental regulations may require filtering or other cleaning of exhausted air.
- All makeup air will be clean and suitable for breathing.
- Oxygen will not be used for ventilation purposes, comfort cooling, blowing dust from clothing, or for cleaning the work area.
- The project Site Safety Representative will provide appropriate methods and controls in the case of specific requirements (including welding rods and fluxes, paints and coatings) for materials containing zinc, lead, mercury, beryllium, cadmium, and stainless steel to be cut, heated, and/or welded.

4.22.6 Fire Protection

- When possible, objects to be welded, cut, or heated will be moved to a designated safe location. If this is not possible, all movable fire hazards in the workspace will be taken away to a safe place.
- If the object to be welded, cut, or heated cannot be moved and all fire hazards cannot be removed (e.g., equipment, walls, floors, etc.), positive means will be taken to confine the heat, sparks, and slag to protect the immovable fire hazards as well as opposite sides.
- No welding, cutting, or heating will be done where the application of flammable paint, the presence of other flammable compounds, or heavy dust concentrations create a possible hazard
- Wherever there are openings or cracks in the flooring that cannot be closed, precautions will be taken so that no sparks will drop through the floor. The same precautions will be taken in the presence of cracks or holes in walls, open doorways, and open or broken windows.
- Approved fire extinguishing equipment will be present in the immediate work area. A minimum of a 10- pound ABC fire extinguisher is required.

4.22.7 Welding/Cutting on Containers

- No welding, cutting, or other hot work will be performed on empty drums, barrels, tanks, or other containers until they have been thoroughly cleaned. (*This is to ensure that there are no flammable materials present or any substances such as greases, tars, acids, or other materials which, when subjected to heat, might produce a hazard.*) Any connection to the drum or vessel will be disconnected or blanked off.
- All hollow spaces, vacancies, or containers will be ventilated to remove gases before preheating, cutting, or welding. Purging with inert gas is recommended.
- In addition to the requirements presented in SH&E SOP 713 – Confined Space Entry, welding/cutting in confined spaces such as a tank, boiler, pressure vessel, or small compartment will require the following precautionary measures:
 - Local exhaust ventilation will be provided, unless workers wear supplied-air respirators.
 - Gas cylinders and/or welding machines will be placed outside the confined space.

4.22.8 Manifolding of Cylinders

- Cylinder manifolds will be installed under the supervision of an experienced person(s) and must

comply with proper practices in construction and use.

- All manifolds and parts will be appropriate for the gases for which they are approved.
- When acetylene cylinders are manifolded, approved flashback arresters will be installed between each cylinder and the coupler block. One flash arrestor installed between the coupler block and regulator is acceptable only for outdoor use or if the number of cylinders coupled does not exceed three.
- Each cylinder lead will be provided with a backflow check valve.

S3NA-418-FM Hot Work Permit

Name of Contractor: _____

Location: _____

Project #: _____

Date: _____

Time: _____

Weather: _____

Person Preparing Permit: _____

Title: _____

Person Conducting Hot Work: _____

Title: _____

THIS PERMIT BECOMES VOID:

1. At the end of the shift, or
2. Whenever conditions change significantly, or
3. On any emergency signal

TYPE OF HOT WORK

☐

PSI CLASS I (Complete full permit)

☐

PSI NON-CLASS I (Complete section B, C, and F)

☐

SSI CLASS I (Complete section A, D, and F)

A. ATMOSPHERIC MONITORING

(Initial and continuous monitoring are required for all Class I Hot Work [PSI and SSI])

B. FIRE WATCH

YES NO

1. Will PSI Class I work be performed?
2. Will PSI Non-Class I work be performed within 35' (10.67 m) of combustible materials?
3. Will PSI hot work be performed where wall or floor openings within 35' (10.67m) would compose combustibles in adjacent areas?
4. Is PSI hot work to be performed where combustibles are adjacent to the opposite side of partitions, ceilings, or roofs being worked on?
5. Will fire alarms or suppression systems be disabled for hot work?

Note: If the answer to any of the fire watch conditions to the left is YES, a dedicated fire watch must be assigned.

Note: The fire watch is authorized to perform air monitoring.

Fire Watch 1:

Fire Watch 2:

C. WORK AREA PREPARATION FOR HOT WORK

	YES	NO	NOT APPLICABLE
1. Is the hot work equipment in proper working order?			
2. Are the proper material safety data sheets available for review?			
3. Have combustible materials been relocated more than 35' (10.67m) from hot work or been properly shielded?			
4. Is firefighting equipment in proper working order?			
5. Have ducts, drains, and sewers been adequately covered to prevent sparks from entering?			
6. If hot work is to be performed indoors, have combustible floors been wet down or properly shielded?			

7. If arc welding equipment will be used, have measures been taken to protect personnel from shock?			
8. If required, is a 20 lb. (9.07kg) fire extinguisher available and appropriate for the type of fire expected?			
9. If hot work is to be performed in or on containers, vessels, tanks, or similar equipment, have they been cleaned, purged, or ventilated, or have other precautions been taken to verify that they are safe for hot work?			
LIST ANY PERSONAL PROTECTIVE EQUIPMENT THAT IS REQUIRED (OTHER THAN THE MINIMUM REQUIRED):			
D. AREA MONITORING PROGRAM			
DOCUMENT WHERE AIR MONITORING WILL OCCUR, WHAT POTENTIAL GAS OR VAPOR SOURCES EXIST WITHIN THE HOT WORK AREA, AND THE WIND DIRECTION:			
E. LOWER EXPLOSIVE LIMIT (LEL) MITIGATION PLAN (Required if initial or continuous monitoring LEL is greater than 0%)			
% LEL DETECTED:		% LEL AFTER CONTROLS IMPLEMENTED	NOT APPLICABLE
(If not applicable, continue monitoring source)			
DOCUMENT THE LOCATION OF CONFIRMED SOURCE(S) OF GAS/VAPOR AND WHAT CONTROLS (IF ANY) HAVE BEEN IMPLEMENTED (Note: Hot work is prohibited if the LEL reading is greater than or equal to 10% in the hot work area.)			
F. AUTHORIZING SIGNATURES			

AUTHORIZED AIR MONITOR: I have performed initial air monitoring with a survey of the hot work area. I agree to perform continuous air monitoring while hot work is being performed in a Class I area and to stop hot work if the LEL reading is greater than or equal to 10%.

Name: Signature:

FIRE WATCH: I agree to maintain a line of sight with the hot work operation at all times, to have immediate access to a fire extinguisher and to remain at the hot work area for 30 minutes after the hot work is completed to verify the area is fire-safe.

Name: Signature:

HOT WORK OPERATORS: *I have reviewed and understand the permit the permit conditions specific to the scope of work. I agree to perform hot work operations within these conditions, to stop any work that I deem to be unsafe, and to notify the performing authority upon completion or interruption of this permitted work.*

Name: **Signature:**

The location where this work is to be done has been examined, necessary precautions have been taken, and permission is granted for this work.

Permit expires:

Signed:

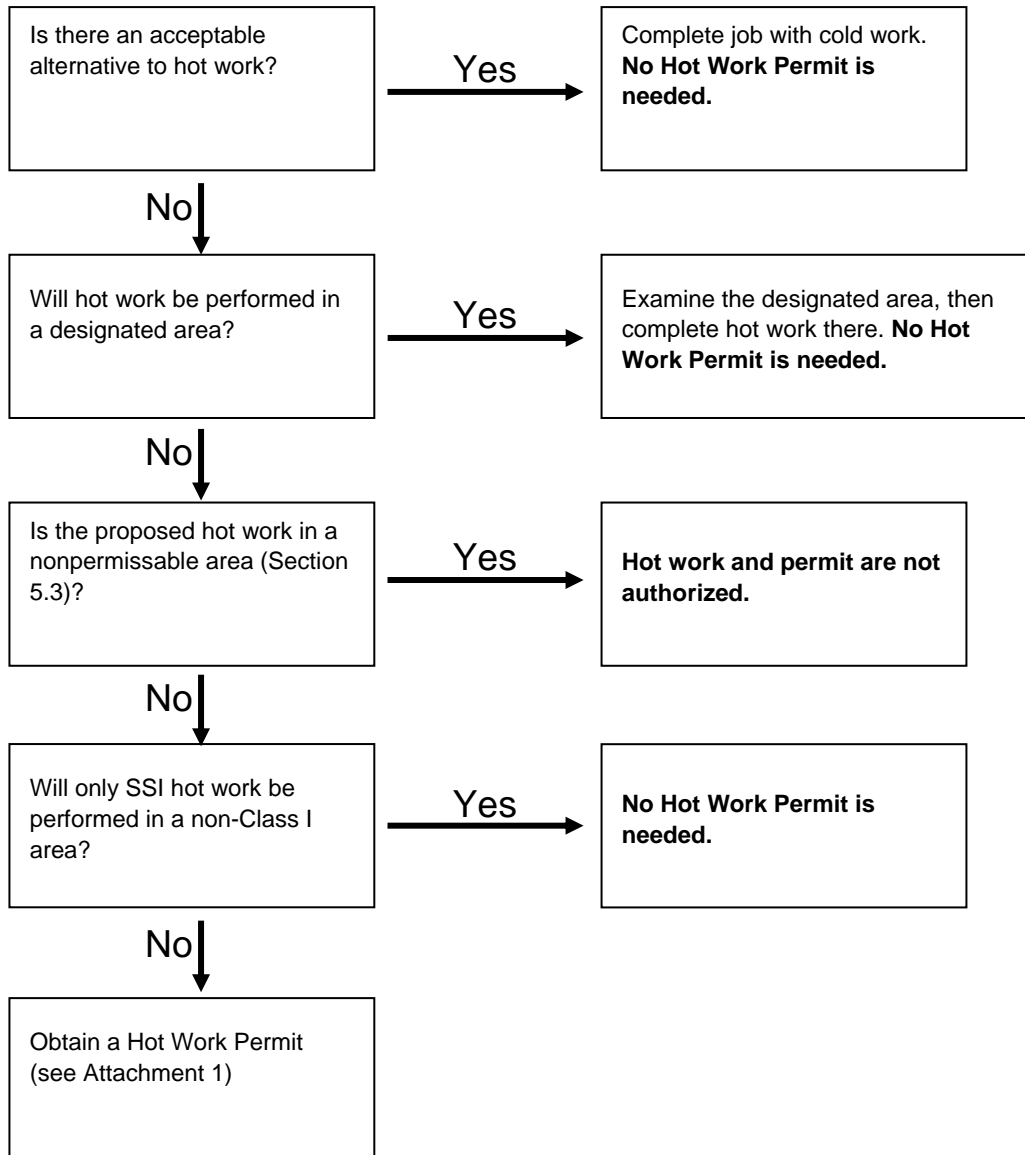

Site Safety Coordinator

Time Hot Work Started:

Time Hot Work Completed:

S3NA-418-GL Hot Work Applicability

Guidelines for determining whether a Hot Work Permit is required are provided below.

S3NA-418-ST Welding, Cutting and Other Hot Work

The following Occupational Health and Safety regulations apply directly to hot work and welding activities:

Jurisdiction	Regulation
United States	
OSHA	OSHA General Industry 29CFR1910.106, Hazardous Materials – Flammable and combustible liquids 29CFR1910.251-255, Welding, Cutting, and Brazing 29CFR1910.307, Electrical – Hazardous (classified) locations OSHA Construction 29CFR1926.350-354, Welding and Cutting 29CFR1926.407, Electrical – Hazardous (classified) locations.
Canada	
Alberta	OHS Code (2009) Sect 169, 171 – 174
British Columbia	OHS Regulation (1997) Sect 12.112 – 12.126
Manitoba	Workplace Health and Safety Regulation (217/2006) Sect 17.1 – 17.9
New Brunswick	OHS Regulation (91-191) Sect 273 – 285
Newfoundland/Labrador	OHS Regulation (C.N.L.R. 1165/96) Sect 75 – 78
Nova Scotia	OHS Regulation (N.S. Reg. 44/99) Sect 109 – 119
NWT/NU Territories	General Safety Regulations (R.R.N.W.T. 1990, c. S-1), Safety Act (SI-013-92) Sect 154 – 167
Ontario	O. Reg. 213/91 Sect 122 – 124
Prince Edward Island	OHS Regulations (EC180/87) Sect 37.1 – 37.24
Quebec	OHS Regulation (R.R.Q., c. S-2.1, r.19.01 O.C. 885-2001) Sect 313 – 321 Safety Code for the Construction Industry (R.R.Q. 1981, c. S-2.1, r. 6) Sect 2.10.7.6, 3.14.1 – 3.14.8
Saskatchewan	OHS Regulation (R.R.S., c. O-1, r. 1) Sect 370, 373
Yukon Territory	OHS Regulations (O.I.C. 2006/178) Sect 13.08 – 13.12

- Hydrogen Sulfide (H₂S) Monitor (for areas with known or suspected H₂S)

4.8 **Training**

- 4.8.1 Staff shall successfully complete a Ground Disturbance training course.
- 4.8.2 Some clients may also have required client-based Ground Disturbance training.

4.9 **Underground Utility Lines**

- 4.9.1 To avoid injury from electrical and other utilities on site, utility lines shall be located and marked prior to conducting any drilling or digging on site. If available, refer to site drawings or client interviews for information pertaining to utilities on site.
- 4.9.2 Types of underground lines:
 - Gas line
 - Potable water line
 - Raw water line
 - Sewer line
 - Power line
 - Cable television/communication line
 - Cathodic protection lines
 - Grounding cable
 - Process piping/flow line
- 4.9.3 Prior to conducting the ground disturbance, you shall locate all pipelines and utilities that pass within (30 m) of the work area. This is your search and control area. To do so, you need to do the following:
 - Notify all pipeline and utility companies, and confirm that their notification requirements are fulfilled prior to conducting a ground disturbance.
 - Identify pipelines, power lines, utilities, and irrigation canals in a 30-foot (9.1 m) zone of the work area with the owner of the utility.
 - On private property, a properly trained and competent third party utility locator shall be used.
 - Get approval for work within a right-of-way (ROW) or within 15 feet (4.6 m) of a line if there is no ROW.
 - Prepare a site map identifying the search area, the ground disturbance area, and known underground utilities.
 - Confirm that all pipelines, power lines, and utilities are marked.
- 4.9.4 Look for pipeline indicators:
 - Look for warning signs where pipelines cross roads or water courses.
 - Look for cut lines, wells, tanks, or valves that may indicate the presence of pipelines.
 - Look for ground settling from previous work.
 - Talk to nearby landowners and residents.
 - Look for vegetation appearing “different” from the surrounding vegetation (e.g., greener, taller, shorter, or more brown than surrounding vegetation).
- 4.9.5 When you are working within a pipeline right-of-way, you shall get written approval from the pipeline owner prior to doing your work.
- 4.9.6 Call the pipeline owner at least two full working days before you dig so the pipeline can be located and marked.
- 4.9.7 Expose the pipeline by hand/hydrovac before digging within 15 feet (4.6 m) of the pipeline with machinery (no machinery comes may come within 2 feet [60 cm] of the pipeline) with the supervision of the owner or their representative, and call the owner at least one full day before you cover the exposed line.

4.9.8 During ground disturbance:

- All underground utilities shall be hand exposed or hydrovac'd within 3.3 feet (1 m) of a mark out or within the distance required by the owner of the utility before operating any mechanized equipment.
- Make arrangements for supervision ("a Signal Person") during hand exposure.
- If for any reason these hand excavations are temporarily filled in, mark them.
- Make arrangements for supervision ("a Signal Person") during any mechanical excavation within 5 m of the underground utility.
- Make arrangements for supervision ("a Signal Person") during backfilling of utilities.
- Cutting back and shoring of excavations shall be completed to ensure that there are no cave-ins (follow *SOP S3NA-303-PR Excavation and Trenching*).
- Do not damage utilities by shovels when hand exposing and picks should not be used.
- Remember that all workers have the right and responsibility to refuse to carry out any work or procedures that they feel are unsafe.
- If the ground disturbance is deeper than 3.3 feet (1 m), all crew members shall have appropriate training for excavations and trenches and shall be protected from cave-ins or sliding/rolling materials (follow *SOP S3NA-303-PR Excavation and Trenching*).
- Remember that incidents, injuries, and near misses shall be reported immediately.
- Review the site-specific emergency response plan.

4.9.9 If you hit an underground facility, stop the work immediately and notify the owner of the facility.

- The owner shall be informed of the location of the contact and the type of damage that resulted.
- If the facility is a pipeline, the company (client) shall immediately notify the required agencies and regulatory bodies of the location of the contact and the type of damage that resulted.
- The government agencies will require a written record and the company (client) should conduct an incident investigation into the causes and make recommendations for the future prevention of this incident.

4.10 Identification of Installations

4.10.1 Various forms of underground utility lines or pipes may be encountered during AECOM deployments to field sites. Damaged utilities, in particular, can present other hazards including asbestos, explosion, electric shock, scalding, etc., and they shall be avoided. The presence of damaged utilities at any work location shall be immediately brought to the attention of the field Lead Manager or other member of the AECOM site management team.

4.10.2 Guidance will be provided on the appropriate action to be taken, which could include suspension of work until the responsible utility agency is contacted and the hazard is either isolated or eliminated.

4.10.3 Extreme caution shall always be exercised when attempting to locate underground utilities. The location of utilities can be in some cases not consistent as shown on drawings, as indicated by the placement of surface signage, or as described by personnel. Coordination and planning of the job shall be required with the client or owner.

- Prior to digging and drilling operations, the client shall always be informed of the potential location(s) of underground utility systems.
- If a utility permit is required from the client or owner, it shall be secured.
- The client shall explain how the utility line may be identified—e.g., red concrete encasement.
- All underground installations shall be considered "live" and "operational" until the owner, client, or utility authority isolates any hazardous energy or deactivates the system and can demonstrate that condition.
- Where a line placement and depth is known or suspected and where there is potential for contact, hand digging, or hand auguring, instrumentation and other investigative techniques shall be used.

4.10.4 The One Call System Definition and Directory or its equivalent shall be used to prepare for excavation work in the event the identity of an underground installation(s) is unknown.

4.10.5 Line location documentation (or appropriate regional agency or company) provides a listing of companies that have registered buried facilities in the proposed work area. Some public utilities and private companies are not members of the One Call System. In order to give line operators sufficient

time to respond to a request to locate, a minimum waiting period of 72 business hours is required prior to beginning work.

- 4.10.6 Once the underground installation has been identified, proper surface markings shall be made in accordance with the guidelines contained in this SOP or as contract-specified.

4.11 **Surface Markings**

- 4.11.1 Color-coded surface marks (paints or similar coatings) shall be used to indicate the type, location, and route of buried installations. Additionally, to increase visibility, color-coded vertical markers (temporary stakes or flags) shall supplement surface marks.
- 4.11.2 All marks and markers shall indicate the name, initials, or logo of the company that owns or operates the installation and the width of the installation if it is greater than two inches.
- 4.11.3 If the surface over the buried installation is to be removed, supplemental offset marking shall be used. Offset markings shall be on a uniform alignment and shall clearly indicate that the actual installation is a specific distance away.

4.12 **Uniform Color-Coding**

- 4.12.1 The colors and corresponding installation type are as follows unless otherwise contract-specified.
- 4.12.2 Red: Electric Power Lines, Cables, Conduit, and Lighting Cables
- 4.12.3 Yellow : Gas, Oil, Stream, Petroleum, or Gaseous Materials
- 4.12.4 Orange : Communication, Alarm or Signal Lines, Cables, or Conduit
- 4.12.5 Green: Sewers and Drain Lines
- 4.12.6 White : Proposed Ground Disturbance area
- 4.12.7 Pink: Temporary Survey Markings
- 4.12.8 Purple: Nonpotable Water

5.0 **Records**

- 5.1 The following records on the identification of and response to underground utilities will be maintained in the project files:
- 5.1.1 All information regarding the identification of underground installations (this information can also be transferred to the appropriate drawings and/or prints and shall be available on site).
- 5.1.2 Drawings and/or prints shall be maintained for the life of this project.
- 5.1.3 Identifying Underground Installations Checklist.

Comments:

S3NA-417-WI One Call System Definition and Directory

1.0 What Is It?

- 1.1 It is a communication system established by two or more utilities, governmental agencies, or other operators of underground facilities to provide one telephone number for excavating contractors and the general public to call for notification of their intent to use equipment for excavating, tunneling, demolition, or any other similar work. This one-call system provides the participating members an opportunity to identify and locate their underground facilities.

2.0 Why Is It Needed?

- 2.1 Damage to underground facilities increased considerably following the building boom of the 1950s, 1960s, and early 1970s when the trend was to go underground with utilities. Thousands of miles of underground facilities were vulnerable to excavating machines such as backhoes, and the resulting damage interrupted utility service and threatened life, health, and property.

3.0 How to Get It

- 3.1 Write or call the number of the Utility Location and Coordination Council (ULCC) One-Call Systems International Committee representing the area within your American Public Works Association (APWA) region shown on the map. They will be pleased to assist you. For further information on ULCC programs, write APWA headquarters.

4.0 Disclaimer

- 4.1 The purpose of this directory is to illustrate the extent of one-call service available. The accuracy of information is not guaranteed by APWA or the one-call systems. Users must verify information including the extent and limit of service from local sources.

S3NA-417-ST Underground Utilities

1.0 Regulations

1.1 Every province and territory has strict regulations governing the procedures and practices that MUST be followed. As these regulations vary slightly, before work can commence, the Project Manager MUST review these documents and identify how all of the hazards will be addressed and how the regulations will be adhered to:

1.1.1 Occupational Health and Safety Code

1.1.2 Regional or industry-specific regulations (e.g., Alberta EUB (Pipeline Act)).

2.0 Occupational Health and Safety Regulations

2.1 The following Occupational Health and Safety regulations apply directly to ground disturbance:

Jurisdiction	Regulation
United States	
OSHA	CFR 1926.651
Canada	
Alberta	OHS Code (2009) Sect 441 – 464, Schedule 9
British Columbia	OHS Regulation (1997) Sect 20.78 – 20.101
Manitoba	Workplace Health and Safety Regulation (217/2006) Sect 26.0 – 26.47
New Brunswick	OHS Regulation (91-191) Sect 93 – 94.1, 180 – 188
Newfoundland/Labrador	OHS Regulation (C.N.L.R. 1165/96) Sect 139 – 148
Nova Scotia	OHS Regulation (N.S. Reg. 44/99) Sect 153, 166 – 173
NWT/NU Territories	General Safety Regulations (R.R.N.W.T. 1990, c. S-1), Safety Act (SI-013-92) Sect 396 – 432
Ontario	O. Reg. 213/91 Sect 6, 7, 222 – 242
Prince Edward Island	OHS Regulations (EC180/87) Sect 12.1 – 12.15
Quebec	Safety Code for the Construction Industry (R.R.Q. 1981, c. S-2.1, r. 6) Sect 3.15.1 – 3.15.10
Saskatchewan	OHS Regulation (R.R.S., c. O-1, r. 1) Sect 257 – 265, Schedule Table 17
Yukon Territory	OHS Regulations (O.I.C. 2006/178) Sect 10.62 – 10.72

S3NA-502-PR Benzene

1.0 Purpose and Scope

- 1.1 Control occupational exposures to benzene to the lowest level practicable.
- 1.2 This procedure applies to all AECOM North America-based employees and operations.
- 1.3 Note: Operations where the only exposure to benzene is from liquid mixtures containing 0.1 percent or less of benzene by volume or the vapors released from such liquids are exempt from the requirements of this procedure.

2.0 Terms and Definitions

- 2.1 **Action Level (AL):** An airborne benzene concentration of 0.5 parts per million by volume (ppm) (or more stringent as required by the provincial/territorial legislation), calculated as an 8- hour time weighted average (TWA).
- 2.2 **Benzene:** Benzene is a naturally occurring organic compound that has become a major industrial chemical. As a pure chemical, it is a clear, colorless liquid with an aromatic odor. Other characteristics of benzene are low vapor pressure, high flammability, and vapors heavier than air. Benzene has a solubility in water in the range of 700 mg/Liter, and liquid benzene is lighter than water. Benzene evaporates very quickly and inhalation is the most likely route of exposure. Brief exposure to high concentrations of benzene can cause drowsiness, dizziness, and headaches. Long-term exposures to benzene can affect normal blood production, resulting in leukemia, and can impair the body's immune system. Benzene is considered by the US EPA to be a human carcinogen.
- 2.3 **HAZWOPER:** Any onsite contamination investigation or clean-up activities subject to the operational requirements of *S3NA-509-PR Hazardous Waste Operations and Emergency Response*.
- 2.4 **Health and Safety Plan (HASP):** A document prepared for a specific project that details the hazards, precautions, emergency planning, medical, and training requirements for that project.
- 2.5 **Permissible Exposure Limit (PEL):** The maximum exposure concentration to which an individual may be exposed to for an 8- hour time weighted average (TWA) without experiencing adverse health effects. For normal work shifts (8 hours or less), the PEL for benzene is 1 ppm (or more stringent as required by the provincial/territorial/state legislation).
- 2.6 **Short-term Exposure Limit (STEL):** The greatest concentration to which nearly all workers may be exposed during any one 15-minute period without experiencing adverse health effects. The STEL for benzene is 5 parts per million (ppm) (or more stringent as required by the provincial/territorial/state legislation).

3.0 Attachments

- 3.1 None

4.0 Procedure

- 4.1 **SH&E Department Responsibilities:**
 - 4.1.1 Provide technical assistance in the evaluation of benzene exposure hazards as requested by management personnel.
 - 4.1.2 Review and approve all benzene exposure hazard assessments prior to the start of work activities.
 - 4.1.3 Review and approve all benzene exposure mitigation plans and exposure monitoring activities to confirm compliance with federal, provincial, territorial, state, and local regulations.
 - 4.1.4 Monitor compliance with the various aspects of this procedure and provide technical assistance regarding implementation of the requirements set forth in this procedure.

4.2 Project Managers' (field task managers, supervisors) Responsibilities

- 4.2.1 Confirm that the presence of benzene-contaminated materials at AECOM work sites is identified (where reasonably possible) prior to commencing field activities, that prior to initiating any task involving disturbance of or contact with benzene-contaminated materials (or immediately upon identification of previously unknown benzene-containing materials) a benzene exposure task hazard assessment is developed and approved by the **SH&E Department**, and that the applicable requirements are observed for each task where the benzene exposure assessment indicates that the airborne benzene concentrations can exceed the Action Level.
- 4.2.2 Confirm that employees assigned to perform any work activities involving benzene-containing materials have been trained in the job-specific hazards of benzene exposure, have received proper medical surveillance, and are trained and properly fit tested in the use of any designated respiratory protection devices.

4.3 Employee Responsibilities

- 4.3.1 Do not disturb or handle any benzene-contaminated materials without appropriate personal protective equipment (PPE), training in the job-specific hazards of benzene exposure, medical monitoring, and respirator fit test.
- 4.3.2 Immediately notify the Project Manager of the presence or suspected presence of previously unidentified benzene-contaminated materials in the workplace, and cease all work activities involving disturbance or contact with the materials until further direction is received.

4.4 Activity-Specific Requirements

Benzene is typically encountered by AECOM as an environmental contaminant, where it is usually a constituent of petroleum fuels or other refined petroleum products that have been released. Benzene can be found in retail gas stations, refineries natural gas processing systems, oil & gas production fields, chemical manufacturing plants, and in products used by employees such as gasoline and solvent systems.

4.4.1 HAZWOPER Activities

Benzene may be present at HAZWOPER sites as a soil or groundwater contaminant or in wastes stored or processed at the site. If such contamination is noted, the following requirements will be observed:

- The site-specific health and safety plan (HASP) will provide a specific analysis of the benzene exposure hazard for each task involving the disturbance or handling of benzene-contaminated materials.
- If any potential is identified for worker benzene exposures to exceed the AL, then specific benzene exposure control and monitoring procedures will be developed for the work activity and included in the HASP.
- If workers are potentially exposed in excess of the AL, they will complete baseline medical monitoring and benzene training.

4.4.2 Other Activities

If the presence of benzene-contaminated material is identified or suspected at any non-HAZWOPER work location, and there is the potential for this material to become disturbed during planned work activities, then the following requirements will be observed:

- A benzene exposure hazard assessment will be completed for each task in which benzene-containing material might be disturbed.
- If any exposure assessment indicates the potential for worker exposures to exceed the AL, then appropriate exposure mitigation procedures will be identified to keep exposures to less than the PEL (required) and the AL (where feasible). Mitigation procedures will be reviewed and approved by the SH&E Manager prior to implementation.
- If workers are potentially exposed in excess of the AL, they will complete baseline medical monitoring and benzene awareness training.
- The SH&E Department will determine if any exposure monitoring procedures will be implemented during work activities.

4.5 Worker Exposure Control Program

The following requirements pertain to all workers performing tasks where the associated benzene exposure assessment indicates the potential for benzene exposures to exceed the AL.

4.5.1 Medical Monitoring Requirements

Prior to commencing work where benzene exposure might exceed the AL, each employee will have completed a medical evaluation as specified by the AECOM corporate medical provider. Typically this will either be a HAZWOPER-protocol exam or a special-needs exam as determined by the physician.

4.5.2 Training

Each worker will have completed training consisting of the following elements:

- The HAZWOPER 40-hour/8-hour Refresher training series, and
- A special benzene-specific training session that addresses:
 - Benzene exposure limits and other regulatory requirements.
 - Job-specific benzene hazards and exposure prevention measures.
 - The health hazards associated with benzene exposure.
 - The quantity, location, manner of use, release, and storage of benzene in the workplace and the specific nature of operations that could result in exposure to benzene, especially exposures above the PEL.
 - The project-specific engineering controls and work practices associated with the employee's job assignment.
 - The measures employees can take to protect themselves from exposure to benzene, including modification of such habits as smoking and personal hygiene, and specific procedures that AECOM has implemented to protect employees from exposure to benzene such as appropriate work practices, emergency procedures, and the provision of personal protective equipment.
 - The purpose, proper selection, fitting, proper use, and limitations of respirators and protective clothing.

4.5.3 Respiratory Protection

Where respiratory protection is specified for use in controlling worker exposures to benzene, each employee will

- Be medically qualified for use of the specified respiratory protection.
- Complete respirator training and fit testing.
- Be assigned an appropriate respirator for use during field operations.

4.5.4 Personal Protective Equipment

In any operation where workers may experience airborne benzene concentrations above the AL, or where the possibility of skin or eye irritation exists, employees shall be provided with the following:

- Disposable coveralls or similar full-body work clothing.
- Gloves, hoods, and boots or disposable shoe coverlets.
- Face shields, goggles, or other appropriate protective equipment necessary for safe job performance.
- Clean change rooms equipped with separate storage facilities to prevent cross contamination from protective work clothing and equipment to street clothes.
- All protective clothing shall be cleaned, laundered, properly disposed of, and repaired or replaced as necessary. AECOM will provide all necessary PPE that is incidental to the work at no cost to the employee.

4.5.5 Air Monitoring

Operations involving the potential airborne exposure to benzene shall be required to conduct initial and ongoing personal air sampling to represent employee exposure.

4.6 Safe Work Practices

Specific safe work practices tailored to the job site exposure hazards, work activities, and environmental conditions will be developed in every HASP that addresses work at sites where benzene exposures may exceed the AL. At a minimum these work practices shall include prohibitions against smoking and consuming food. Workers shall be provided with potable water for washing exposed skin prior to leaving the project area, eating, drinking, and/or smoking.

4.7 Emergency Preparedness

Fire extinguishers shall be available at project sites where liquid benzene or benzene vapors might be present. Employees shall be trained in the use of the fire extinguishers, the emergency notification provisions of the HASP, and evacuation routes and willer points.

5.0 Records

- 5.1 Medical surveillance, employee monitoring, and training records shall be maintained as specified by *S3NA-003-PR SH&E Training*, *S3NA-602-PR Exposure Monitoring*, *S3NA-604-PR Medical Records*, and *S3NA-605-PR Medical Surveillance Program*.

6.0 References

- 6.5 S3NA-604-PR Medical Records
- 6.6 S3NA-605-PR Medical Surveillance Program

S3NA-505-PR Cold Stress Prevention

1.0 Purpose and Scope

- 1.1 To protect workers from the severest effects of cold stress (hypothermia) and cold injury and to identify exposures to cold working conditions under which it is believed nearly all workers can be repeatedly exposed without adverse health effects.
- 1.2 This procedure applies to all AECOM North America-based employees and operations.

2.0 Terms and Definitions

- 2.1 **Cold Stress:** The production of physiological effects due to cold temperatures and/or wind chill.
- 2.2 **Equivalent Chill Temperature (ECT):** Also known as Wind Chill (see below)
- 2.3 **Frostnip:** Superficial cooling of tissues without cellular destruction.
- 2.4 **Frostbite:** Freezing of tissue, resulting in tissue destruction.
- 2.5 **Hypothermia:** Condition of reduced core body temperature to 95°F (35°C) resulting in loss of dexterity, loss of mental alertness, collapse, and possible death.
- 2.6 **Wind Chill:** The combined effect of air temperature and wind. Also expressed as "equivalent chill temperature" (ECT), wind chill is defined as heat loss resulting from the effects of air temperature and wind velocity upon exposed skin.

3.0 Attachments

- 3.1 S3NA-505-WI1 Temperature Thresholds
- 3.2 S3NA-505-WI2 Symptoms and Treatment
- 3.3 S3NA-505-ST Cold Exposure

4.0 Procedure

4.1 Restrictions

- 4.1.1 Staff working in extreme cold (wind chill or ECT below 10°F or -12°C) shall not work alone.
- 4.1.2 All staff working in extreme cold or snow conditions should understand the following guidelines for preventing and detecting hypothermia and frost bite.
- If you experience frost bite or hypothermia, find shelter and warmth and contact a medical practitioner if symptoms persist.
 - Take frequent short breaks in warm dry shelters to allow your body to warm up. Limit time of exposure.
 - Schedule work for the warmest part of the day or when the wind is most calm.
 - Avoid exhaustion or fatigue because energy is needed to keep muscles warm.
 - Because prolonged exposure to cold air or to immersion in cold water at temperatures even well above freezing can lead to dangerous hypothermia, whole-body protection shall be used.

4.2 Roles and Responsibilities

4.2.1 Project Managers/field task managers

- Implement cold stress prevention measures as applicable at each work site.
- Develop/coordinate a work-warning regimen, as applicable.
- Confirm cold stress hazard assessments/evaluations were completed for the planned activities.
- Assign personnel physically capable of performing the assigned tasks. Consider acclimation to cold weather when evaluating worker capability.
- Confirm personnel are properly trained to recognize the symptoms of cold stress.

4.2.2 Region SH&E Managers

- Conduct/support cold stress assessments/evaluations.
- Conduct/support incident investigations related to potential cold stress-related illnesses.
- Assist project teams develop appropriate work-warming regimens.
- Provide cold stress awareness training.

4.2.3 Supervisors

- Identify the tasks that may be most impacted by cold stress and communicate the hazard to the assigned employees.
- Confirm that employees have been trained on the recognition of cold stress-related illnesses.
- Confirm that adequate supplies of warm fluids/drinks are readily available to employees.
- Confirm that a warm/sheltered rest area is available, as applicable.
- Conduct cold stress monitoring, as applicable.
- Implement the work-warming regimen.
- Confirm that first aid measures are implemented once cold stress symptoms are identified.
- Confirm that personnel are physically capable of performing the assigned tasks and are not in a physically compromised condition.

4.2.4 Employees

- Observe each other for the early symptoms of cold stress-related illnesses.
- Maintain an adequate intake of available fluids.
- Report to work in a properly vested condition.
- Report all suspected cold stress-related illnesses.

4.3 Training

4.3.1 Before they begin work in a cold environment, project staff who might be exposed to cold stress will be informed of the potential for cold stress and how to prevent cold stress. Workers that have not had the training within the twelve prior months shall repeat the training before exposure to cold stress.

4.3.2 Personnel potentially exposed to cold stress will receive training including, but not limited to:

- Sources of cold stress, the influence of protective clothing, and the importance of acclimatization
- How the body loses heat.
- Recognition of cold-related illness symptoms
- Cold stress preventative/corrective measures
- The harmful effects of excessive alcohol consumption in a cold stress environment
- The hazards associated with unstable snow or ice build ups
- First aid procedures for symptoms related to cold stress

4.4 Personal Protective Equipment

4.4.1 Wear multiple layers of loose fitting clothing to maintain immobile layers of warm air next to the body.

4.4.2 Avoid cotton, especially blue jeans.

4.4.3 Wear proper clothing, including head coverings and gloves or mittens for cold, wet, and windy conditions.

4.4.4 Use insulated footwear with adequate traction to prevent slips and falls.

4.4.5 Confirm extra blankets or sleeping bags are on-site.

4.4.6 Sunglasses and sunscreen should be used when there is a persistent combination of snow and direct sun.

4.4.7 If shelter is not readily available, consider supplying temporary shelters

4.4.8 Confirm that staff carry fire starter materials if working in remote areas..

4.4.9 Pack warm, sweet drinks, and high calorie food for snacks.

4.5 General Cold Stress Prevention Measures**4.5.1** In order to prevent hypothermia:

- Wear multiple layers of clothing to maintain immobile layers of warm air next to the body. Avoid cotton, especially blue jeans.
- When active, ventilate excess heat by opening or removing outer layers of clothing to avoid sweating.
 - Start with the mitten or gloves, unless protection from ice, snow, or cold metal surfaces is needed.
 - Next remove head gear and neck wrappings.
 - Then coats/parkas should be opened at the waist and sleeves.
 - Finally, layers of clothing should be taken off.
 - When resting or tired, or colder conditions are encountered, add additional layers of clothing/ close outer layers in the reverse of the above order, or get out of the cold. Have a sweet drink but do not indulge in heavy eating.
- Garments worn to keep out rain and spray should also allow water vapor to escape.
- Take advantage of heat from the sun and stay out of the wind as much as possible.
- Have available emergency shelter providing protection from wind and rain and insulation from the ground.
- Replace wet clothing. If wet clothing cannot be replaced, then cover it with a layer of non-breathing material to prevent evaporation. Place an insulation layer over this non-breathing material.
- Get adequate rest; conserve energy.
- Get adequate nutrition to replenish energy stores; rest after meals.
- Drink adequate fluids to avoid dehydration.
- If any project staff member shows signs of hypothermia, stop and treat him/her.

4.5.2 In order to prevent frost bite:

- Dress to prevent hypothermia and protect the feet and hands.
- Avoid obstruction of circulation by, for example, tight boots or tightly fitting clothing.
- Avoid nicotine, particularly cigarettes, and alcohol.
- Keep ears and nose covered and out of the wind.
- Frostbite of the corneas of the eyes can be prevented by protective goggles.
- Adopt a “buddy system” of constantly watching the faces of others in the party for white skin tissue, which is evidence of frostbite (frostnip).
- Practice constant personal vigilance for signs of trouble in one’s own fingers and toes; when in doubt, investigate thoroughly before it is too late.

4.5.3 Adequate, insulating dry clothing that will help maintain core temperatures above 96.8°F (37°C) shall be provided to workers if work is performed in air temperatures below 40°F (5°C). Wind chill cooling rate and the cooling power of air are critical factors. The higher the wind speed and the lower the temperature in the work area, the greater the insulation value of the protective clothing required.

4.5.4 An Equivalent Chill Temperature (ECT) chart relating the actual dry bulb air temperature and the wind velocity is presented in *S3NA-505-W1 Temperature Thresholds*. Unless unusual or extenuating circumstances exist, cold injury to other than hands, feet, and head is not likely to occur without the development of the initial signs of hypothermia. Superficial or deep local tissue freezing will occur only at temperatures below 32°F (0°C) regardless of wind speed. However, older workers or workers with circulatory problems require special precautionary protection against cold injury. The use of extra insulating clothing and/or a reduction in the duration of the exposure period are among the special precautions that should be considered.

4.5.5 Continuous exposure of skin should not be permitted when the air speed and temperature results in an ECT of –25°F (-32°C) or below.

4.5.6 At air temperatures of 40°F (5°C) or less, it is imperative that workers who become immersed in water or whose clothing becomes wet be immediately removed from the cold environment, provided a change of clothing, and be treated for hypothermia.

- 4.5.7 If the air velocity at the job site is increased by wind, draft, or artificial ventilating equipment, the cooling effect of the wind should be reduced by shielding the work area or by wearing an easily removable windbreak garment.
- 4.5.8 Adequate protection, such as general ventilation, shall be incorporated into any warming shelter design to prevent carbon monoxide poisoning.
- 4.5.9 Operation of internal combustion or similar devices within warming shelters is prohibited.
- 4.5.10 If the available clothing does not give adequate protection to prevent hypothermia or frostbite, work should be modified or suspended until adequate clothing is made available or until weather conditions improve.
- 4.5.11 Walking and working surfaces shall be cleared of ice and snow to prevent slips and falls.
- 4.5.12 Supplies such as PPE, fuels, enclosures, de-icing, traction aids, warm drinks, and batteries will be specified by the SH&E Manager and/or the Project Manager. These supplies will be inspected at least weekly during cold weather projects and replaced when necessary.
- 4.6 **Cold Stress Prevention Measures for the Hands**
- 4.6.1 Special protection of the hands is required to maintain manual dexterity for the prevention of accidents including, but not limited to the following:
- If fine work is to be performed with bare hands for more than 10 to 20 minutes in an environment below 60°F (15° C), special provisions should be established for keeping the workers' hands warm. For this purpose, warm air jets, radiant heaters (fuel burner or electric radiator), or contact warm plates may be utilized. Metal handles of tools and control bars should be covered by thermal insulating material at temperatures below 30°F (-1° C).
 - If the air temperature falls below 60°F (15° C) for sedentary work, 40°F (5° C) for light work, or 20°F (-6° C) for moderate work, and fine manual dexterity is not required, workers should use gloves.
- 4.6.2 To prevent contact frostbite, workers should wear anti-contact gloves:
- When cold surfaces below 20°F (-6° C) are within reach, each worker should be warned to prevent inadvertent contact by bare skin.
 - If the air temperature is 0°F (-18° C) or less, workers should protect their hands with mittens. Machine controls and tools for use in cold conditions should be designed so that they can be handled without removing the mittens.
- 4.6.3 Provisions for additional total body protection are required if work is performed in an environment at or below 40°F (5° C). The workers should wear cold protective clothing appropriate for the level of cold and physical activity.
- 4.6.4 Additional Cold Stress Prevention Measures For work practices at or below 10°F (-12° C) ECT, the following will apply:
- The worker should be under constant protective observation (buddy system or supervision).
 - The work rate should not be so high as to cause heavy sweating that will result in wet clothing. If heavy work is being performed, rest periods should be taken in heated shelters and opportunities to change into dry clothing should be provided.
 - New employees should not be required to work full time in the cold during the first days of employment until they become acclimated to the working conditions and required protective clothing.
 - The weight and bulkiness of clothing should be included in estimating the required work performance and weights to be lifted by the worker.
 - The work should be arranged in such a way that sitting still or standing still for long periods is minimized. Unprotected metal chair seats should not be used. The worker should be protected from drafts to the greatest extent possible.
 - Workers should be instructed in safety and health procedures, which should address:
 - Proper rewarming procedures and appropriate first aid treatment.
 - Proper clothing practices.
 - Proper eating and drinking habits.
 - Recognition of impending frostbite.

- Recognition of signs and symptoms of impending hypothermia or excessive cooling of the body even when shivering does not occur.
- Safe work practices.

4.6.5 Eye protection for workers employed outdoors in a snow and/or ice-covered terrain should be supplied. Special safety goggles to protect against blowing ice crystals and ultraviolet light and glare (which can produce temporary conjunctivitis and/or temporary loss of vision) should be required when there is an expanse of snow coverage causing a potential eye exposure hazard.

4.6.6 Workers handling evaporative liquid (gasoline, alcohol, or cleaning fluids) at air temperatures below 40°F should take special precautions to avoid soaking of clothing or gloves with the liquids because of the added danger of cold injury due to evaporative cooling. Special note should be taken of the particularly acute effects of splashes of “cryogenic fluids” or those liquids with a boiling point that is just above ambient temperature.

4.6.7 Trauma sustained in freezing or subzero conditions requires special attention, because an injured worker is predisposed to cold injury. Special provisions should be made to prevent hypothermia and freezing of damaged tissue in addition to providing for first aid treatment.

4.7 **Work-Warming Regimen**

4.7.1 If work is performed continuously in the cold at an equivalent chill temperature (ECT) at or below -15°F (-26°C), heated warming shelters (tents, cabins, rest rooms, etc.) should be made available nearby. The workers should be encouraged to use these shelters at regular intervals; the frequency will depend on the severity of the environmental exposure.

4.7.2 The onset of heavy shivering, minor frostbite (frostnip), the feeling of excessive fatigue, drowsiness, irritability, or euphoria are indications for immediate return to the shelter.

4.7.3 When entering the heated shelter, the outer layer of clothing should be removed and the remainder of the clothing should be loosened to permit sweat evaporation or a change of dry work clothing provided.

4.7.4 A change of dry work clothing should be provided as necessary to prevent workers from returning to the cold environment with wet clothing.

5.0 **Records**

5.1 Training records will be maintained by the SH&E Department

5.2 Exposure assessments will be documented in the project files.

6.0 **References**

6.1 See attachment S3NA-505-WI1 Temperature Thresholds.

S3NA-505-WI1 Temperature Thresholds

1.0 Purpose and Scope

- 1.1 The following table gives apparent temperatures (wind chill) for various combinations of wind and air temperature, as well as guidelines to the danger of skin exposure.

Table 1. Wind Chill Chart (C)

Actual Temp (°C)	Wind Speed in km/hour									
	8	16	24	32	40	48	56	64	72	80
	Ambient Temperature (°C)									
0	-2	-8	-11	-14	-16	-17	-18	-19	-19	-20

-35° to -39°													-38° to -39°
-40° to -44°	30 min 5		30 min 5		Cease Work		Cease Work		Cease Work		Cease Work		-40° to -42°
-44° & below													-43° & below

Modified from ACGIH 2002 Threshold Limit Values for Chemical Substances and Physical Agents.

Note 1: Schedule describes the maximum continuous duration of work and number of 10-15 minute breaks to be observed during any 4-hour work period and assumes that period will be followed by an extended warm-up period (e.g., lunch). Allowed breaks should be taken in a warm environment.

Note 2: Schedule applies to moderate to heavy work performed by acclimated workers wearing appropriate layered clothing. For light to moderate work apply the schedule for conditions one step lower. For unacclimated workers apply the schedule for conditions two steps lower. These modifications are additive.

Note 3: For work under 25%–50% overcast/clouds, apply the schedule for conditions one step lower. For work at night or under greater than 50% overcast/clouds, apply the schedule for conditions two steps lower. These modifications are additive with any applicable modifications from Note 2.

Note 4: For wind speeds in excess of 25 mph, cease all nonemergency work when temperatures fall below 5°F.

S3NA-505-WI2 Symptoms and Treatment

1.0 Cold Stress-related Illnesses

1.1 Frostbite

1.1.1 Frostbite is a localized cold injury characterized by freezing of the tissues with ice crystal formation.

1.1.2 This injury is almost always limited to the upper and lower extremities or to such appendages as the ears or nose.

1.1.3 Conditions conducive to frostbite include sub-zero temperatures, hypothermia (most important predisposing factor), dehydration, obstruction of the blood supply to the extremities (by constricting clothing, especially on the feet or at the wrists or ankles), contact with cold metal, contact with organic liquids (such as gasoline or solvents that have been left outdoors in sub-zero temperatures), use of substances that cause vasoconstriction (such as smoking tobacco), or other injury or shock.

1.1.4 Symptoms of frostbite include:

- Pain in the involved tissue is the earliest symptom.
- Sudden and complete cessation of cold or discomfort in affected fingers or toes, often followed by a pleasant feeling of warmth.
- Subsequently the only symptom may be the absence of any sensation in the frozen part.
- Paleness in the affected tissues.
- Firm or hard tissues.
- Purple tissue, if a large area, such as an entire hand or foot, is frostbitten.

1.1.5 If exposure occurs in temperatures that are below freezing (32°F or below), frostbite or trench foot (immersion foot) may accompany or complicate the symptoms of hypothermia. Frostbite is the freezing of living tissues with a resultant breakdown of cell structure. Symptoms due to frostbite may include, but is not limited to:

- Superficial redness of the skin
- Slight numbness
- Blisters
- Obstruction of blood flow (ischemia)
- Blood clots (thrombosis)
- Skin discoloration due to insufficient oxygen in the blood (cyanosis)

1.1.6 Frostbite may occur if the skin comes into contact with objects with a surface temperature below freezing, such as metal tool handles. Trench foot is caused by continuous exposure to cold combined with persistent dampness or immersion in water. Injuries in this case include permanent tissue damage due to oxygen deficiency, damage to capillary walls, severe pain, blistering, tissue death, and ulceration.

1.1.7 Additionally, cold exposures may either induce or intensify vascular abnormalities. These include chilblain (a swelling or sore), Raynaud's disease, acrocyanosis (blueness of hands and feet) and thromboangiitis (inflammation of the innermost walls of blood vessels with accompanying clot formation). Workers suffering from these ailments should take particular precautions to avoid chilling.

1.2 Hypothermia

1.2.1 Hypothermia is a lower than normal body temperature that occurs when outer cold cools the body faster than the body can produce heat to stay warm.

1.2.2 Hypothermia can be caused by exposure to wind, cold, and/or moisture. The combination of wind, cold, and moisture can be deadly.

1.2.3 Early warning signs of hypothermia:

- Feeling of being cold and tired.
- Heavier breathing and increased pulse rate.
- Tendency to keep moving (e.g., stamping feet, rubbing hands, continued walking/pacing).
- Goose bumps, holding arms tightly wrapped around the body, hunching of shoulders.

- Shivering.
- 1.2.4 Hypothermia damages both the body's internal temperature mechanisms (hypothalamus) and the peripheral mechanisms to prevent heat loss (vasoconstriction and perspiration.) These effects may last up to three years after the initial hypothermia episode. Symptoms of hypothermia may include, but are not limited to:
- Pain in the extremities.
 - Severe shivering and numbness.
 - Low core body temperature.
 - Drowsiness and muscular weakness.
 - Apathy.
 - Mental confusion.
 - Loss of consciousness.
 - Shock.
 - Decreasing pulse and breathing rate.

2.0 Recommended Treatment for Cold Stress-related Illnesses

2.1 Frostbite

- 2.1.1 Wrap the victim in woolen blanket and keep dry until he or she can be brought inside.
- 2.1.2 Remove the victim from the cold environment.
- 2.1.3 Do not rub, chafe, or manipulate frozen parts.
- 2.1.4 Place the victim in warm water (102°F to 105°F) and make sure the water remains warm. Test the water by pouring it on the inner surface of your forearm. Never thaw affected body parts if the victim has to go back out into the cold; refreezing can cause significant tissue damage.
- 2.1.5 Do not use hot water bottles or a heat lamp, and do not place the victim near a hot stove.
- 2.1.6 Do not allow the victim to walk if his or her feet are affected.
- 2.1.7 Have the victim gently exercise the affected parts once they are thawed.
- 2.1.8 Seek immediate medical attention for thawing of serious frostbite.

2.2 Hypothermia

- 2.2.1 Bring the victim into a warm room or shelter as quickly as possible.
- 2.2.2 Give artificial respiration and stop any bleeding, if necessary.
- 2.2.3 If the victim cannot be moved (spinal injury, etc.), carefully place newspapers, blankets, or some other insulation between the victim and the ground.
- 2.2.4 Remove all wet clothing.
- 2.2.5 Provide an external heat source, because the body cannot generate its own heat. Wrap the victim in prewarmed blankets, place him or her in the liner of a portable hypothermia treatment unit, put the torso (not the extremities) into a tub of warm water, or use body-to-body contact to rewarm the body core. These measures will slowly reopen the peripheral circulation, minimizing the possibility of after-shock or after-drop (the flowing of cooled, stagnated blood from the limbs to the heart), which may cause ventricular fibrillation, cardiac arrest, or death.
- 2.2.6 Do not allow the victim to sleep.
- 2.2.7 Give warm, sweet drinks. Do not give alcohol or pain relievers.
- 2.2.8 Keep the victim still. Do not try to walk.
- 2.2.9 Do not rub numb skin.
- 2.2.10 Get medical attention as soon as possible.

S3NA-505-ST Cold Exposure

The following Occupational Health and Safety regulations apply directly to cold and snow hazards:

Jurisdiction	Regulation
United States	
OSHA	Title 29, Code of Federal Regulations, Sections 1910.1027 and 1926.1127
Canada	
Alberta	n/a
British Columbia	OHS Regulation (1997) Sect 7.33 – 7.38
Manitoba	Workplace Health and Safety Regulation (217/2006) Sect 4.12, 4.14
New Brunswick	OHS Regulation (91-191) Sect 44
Newfoundland/Labrador	OHS Regulation (C.N.L.R. 1165/96) Sect 10
Nova Scotia	n/a
NWT/NU Territories	n/a
Ontario	O. Reg. 851 Sect 39, 129
Prince Edward Island	OHS Regulations (EC180/87) Sect 42.1
Quebec	OHS Regulation (R.R.Q., c. S-2.1, r.19.01 O.C. 885-2001) Schedule 4
Saskatchewan	OHS Regulation (R.R.S., c. O-1, r. 1) Sect 70 Cold Conditions Guidelines for Outside Workers
Yukon Territory	Occupational Health Regulations (O.I.C. 1986/164) Sect 9

S3NA-508-PR Hazardous Materials Handling and Shipping

1.0 Purpose and Scope

- 1.1 Prescribes the minimum requirements for shipping samples, hazardous materials (HZM) and dangerous goods. It is designed to provide a framework for compliance with the requirements of the U.S. Department of Transportation (DOT) Hazardous Materials Regulations (HMR) published under 49 CFR or Transport Canada Transportation of Dangerous Goods Regulations (TDG Regulations) published under Amendment 6 (SOR/2008-34) for shipment of hazardous materials/dangerous goods by land, and the International Air Transportation Association (IATA) Dangerous Goods Regulations (DGR) for shipping dangerous goods by air.
- 1.2 Applies to all AECOM North America based staff and operations.

2.0 Terms and Definitions

A complete list of definitions can be found in their entirety in the HMR, the TDG Regulations, and the IATA DGR.

- 2.1 **Carrier:** A person engaged in the transportation of passengers or property by land, water, or air either as a common, contract, private carrier, or civil aircraft.
- 2.2 **Dangerous goods:** Articles or substances which are capable of posing a risk to health, safety, property or the environment and which are shown in the list of dangerous goods in the TDG Regulations and/or IATA regulations or which are classified according to the TDG Regulations and/or IATA regulations. Generally synonymous with hazardous materials.
- 2.3 **Hazardous materials (HzM):** A substance or material which has been determined by the U.S. Secretary of Transportation to be capable of posing an unreasonable risk to health, safety, and property when transported in commerce, and includes hazardous substances, hazardous wastes, marine pollutants, and elevated temperature materials.
- 2.3.1 Hazardous materials may include, but are not limited to: batteries, adhesives, paints, compressed gases, nuclear density meters, laboratory reagents, field samples, soil and sand siftings, hazardous wastes, and materials used for bench scale and pilot plant operations. While most environmental samples (both water and soil) do not meet the definition of hazardous material, extreme care must be taken to properly classify materials. HzM Classifications are as follows:
- Class 1 Explosives
 - Class 2 Compressed Gases
 - Class 3 Flammable Liquids
 - Class 4 Flammable Solids, Spontaneously Combustible and Water Reactive Solids
 - Class 5 Oxidizers and Organic Peroxides
 - Class 6 Poisonous and Infectious Substances
 - Class 7 Radioactive Materials
 - Class 8 Corrosive Substances
 - Class 9 Miscellaneous
- 2.4 **HzM employee:** A person who is employed by AECOM who in the course of employment directly affects dangerous goods/hazardous materials transportation safety. This term includes employees who prepare hazardous materials for transportation, or are responsible for safety of transporting hazardous materials.

- 2.5 **HzM employer:** A person who uses one or more of its employees in connection with transporting dangerous goods/hazardous materials in commerce, causing hazardous materials to be transported or shipping in commerce.
- 2.6 **HMR:** Hazardous Material Regulation
- 2.7 **IATA:** International Air Transport Association.
- 2.8 **ICAO:** International Civil Aviation Organization
- 2.9 **Materials of Trade:** A hazardous material, other than a hazardous waste, that is carried on a motor vehicle
- 2.9.1 For the purpose of protecting the health and safety of the motor vehicle operator or passengers;
- 2.9.2 For the purpose of supporting the operation or maintenance of a motor vehicle (including its auxiliary equipment); or
- 2.9.3 By a private motor carrier in direct support of a principal business that is other than transportation by motor vehicle.
- 2.10 **NAPL:** Non-aqueous phase liquid
- 2.11 **Offeror:** Any person who performs functions including selecting packaging, physical transfer of hazardous materials, classifying hazardous materials, preparing shipping papers, signing hazardous material certifications on shipping papers (as agent for), marking or placarding vehicles or packagings, or providing placards to carriers.
- 2.12 **Reportable Quantity (RQ):** The spill- or incident-related quantity of a material listed in the applicable regulations requiring a formal report.
- 2.13 **Serious Hazardous Materials Incident:** Anytime a material is found outside of its containment and has the potential to harm people or the environment.
- 2.14 **Shipper:** see Carrier

- 3.1 None

4.0 Procedure

4.1 Roles and Responsibilities

- 4.1.1 **Americas SH&E Director** is responsible for the following:
- Define the training to be required of employees involved in HZM shipping and facilitate the delivery of that training.
 - Coordinate information/resources for AECOM employees involved in shipping materials.
 - Collect and file copies of all HZM shipping papers in a central location for review by the DOT and other agencies.
 - Provide resources to employees involved in shipping hazardous materials.
 - Contract a 24-hour emergency response service with a telephone number that will be answered by a person either with information on the hazards of the shipment or with immediate access to such a person.
 - Serve as the central point of contact for information regarding this policy and procedure.
- 4.1.2 **Region SH&E Managers** are responsible for the following:
- Ensure that **District, Office, and Project Managers** who have personnel involved in the process of preparing hazardous materials for shipment have appropriately trained individuals, including both office and field personnel.

- The **Region SH&E Manager** will assign a HZM shipping specialist or specialists to manage the Region's hazardous materials program.
- 4.1.3 **Project Managers (including Field task managers, supervisors)** are responsible for the following:
- Be familiar with the training requirements for shipment, labeling, and packaging of HzM.
 - Confirm compliance and implementation of this procedure for all operations under their control. Also confirm that affected personnel have the required formal training in accordance with this procedure for both field/project sites and office locations.
 - File copies of all completed HzM shipping papers in the project file and provide a copy to their HzM Shipping Specialist.
- 4.1.4 **Office Manager** is responsible for the following:
- Develop a process by which hazardous materials will be properly shipped and received.
 - Identify properly trained personnel to manage the hazardous material shipping/receipt process within the office.
- 4.1.5 **HZM Employees** are responsible for the following:
- Shipper/Receiver - Awareness Level
 - Level 1 Shipper
 - Level 2 Shipping Specialist
- 4.1.6 **Shipper - Awareness Level** is responsible for the following:
- Any AECOM **employee** who receives, ships, or packages anything for transport (Fed Ex, UPS, US Postal, etc.) is required to be trained at the awareness level. The training is an education and guidance tool for any personnel that send or receive packages.
- 4.1.7 **Level 1 Shipper** is responsible for the following:
- **Employees** who ship sample coolers and transport field equipment are required to be trained in accordance with DOT HMR/TDG Regulations/IATA DGR requirements. This training provides an elevated level of education for employees in more dynamic roles. This level of training is required for all personnel involved in transport or preparation of paperwork, packaging, and labeling of any hazardous and/or potentially HzM. **Level 1** personnel must have direct support from a **Level 2 AECOM Shipping Specialist** when receiving or shipping regulated materials or when questioning the regulated status of materials.
- 4.1.8 **Level 2 Shipping Specialist** is responsible for the following:
- The **AECOM Level 2 Shipping Specialist** is responsible for oversight of the HzM Program within their respective District or Section. **Level 2** personnel must complete a comprehensive 2-day HzM shipping training course to comply with applicable regulations on transporting HzM. Consult with your representative **District or Region SH&E Manager** for additional information.
- 4.1.9 **Employees** are responsible for the following:
- Do not handle, receive or ship samples, HzM or dangerous goods without having appropriate and documented training as specified in this procedure. Note that if the employee does not think he/she would be allowed to carry the material onto a passenger aircraft, it is probably HzM.
 - The **employee** shall immediately notify the **Field Task Manager** or **Office Manager** of concerns or questions about the condition/contents of samples, HzM, or dangerous goods to be shipped and/or received.

4.2 Shipping

4.2.1 Select the best way to ship the hazardous material based on the quantity, hazard(s), and mode of transportation (e.g., air, land, water). Since more restrictive requirements apply to air shipments, ground shipment (e.g., use of a lab courier service) is encouraged for shipping HzM.

4.2.2 Most (if not all) package shipments (Common Carriers such as Federal Express, UPS, etc.) are transported by air. Air transportation of hazardous materials is regulated by IATA. AECOM will occasionally ship HzM internationally (e.g., Puerto Rico is considered an international destination by Federal Express). AECOM **employees** must follow the IATA DGR for any air transportation of hazardous materials.

4.3 Ground transportation of HzM may use either HMR or TDG Regulations protocols.

4.3.1 Specific packaging and shipping instructions apply to all dangerous goods shipments. These instructions vary by chemical/product and are different for passenger aircraft and cargo aircraft.

4.3.2 Carrier-specific requirements can be obtained from the Internet or by calling the carrier's customer service line.

4.3.3 The process for offering HzM for shipment includes:

- Determine the proper shipping name, hazard class, labeling requirements, and packing group.
- Determine and comply with the proper packaging instructions.
- Choose the proper package based on the packaging instruction and the type and quantity of material being shipped.
- Ensure package contents are compatible.
- Package, mark and label according to applicable regulations and instructions.
- Prepare shipping papers and complete the bill of lading or shipper's declaration for dangerous goods, according to applicable regulations and according to the carrier's specific requirements.
- Include on the shipping documents the shipper's certification, emergency response information and telephone number.
- Include with the shipment a copy of the applicable emergency response information with shipping papers for responders to use in emergency situations. This information includes, but is not limited to, appropriate pages from the DOT Emergency Response Guidebook (ERG) and/or Material Safety Data Sheets (MSDS).

4.3.4 AECOM personnel participating in shipping HzM are required to provide a 24-hour emergency response telephone number that must be answered by a person either with information on the hazards of the shipment or with immediate access to such a person. AECOM has selected INFOTRAC® (<http://www.infotrac.net/>) to provide 24-hour emergency response support service. Effective October 2010, all HzM shipping papers which list INFOTRAC® for 24-hour emergency response must list AECOM's account number 74984.

4.3.5 Determine the placard or placards required for the materials being offered for transportation, provide placards and affix as required.

4.3.6 Notify the carrier of the proper shipping name, hazard class and total quantity of each hazardous material being offered for transportation, and make a final check for compliance with regulations and instructions before tendering the shipment to the carrier. All HzM shipping papers and dangerous goods airbills must be typed.

4.4 Training

4.4.1 **Employees** involved in shipping hazardous materials/dangerous goods (e.g., packaging, preparing paperwork, loading and/or unloading, and transporting hazardous materials) are required to have documented training prior to shipping activities. Training requirements are based on the type of materials shipped (e.g., calibration/compressed gases, laboratory reagents, field samples, hazardous wastes, etc.)

and **employee** responsibility. Training curriculum will include function-specific, general awareness, safety and security awareness based on the two levels of expertise defined below.

4.5 **Training Documentation**

4.5.1 **Employees** are required to have documented training prior to performing activities that involve the shipment of hazardous materials/dangerous goods.

4.5.2 Documentation of training will be maintained by employees (certificates) and in employees' office locations. Documentation must include the following: course outline, sign-up/log-in sheet with employee name, date(s) of training, and certificate of completion from the training institute. The SH&E Department will log the training information to track compliance and refresher dates.

4.6 **Incident Reporting**

4.6.1 AECOM **employees** who ship HzM must be aware of the reporting requirements for any incident that occurs with material we have offered for shipment or that we are transporting as carriers (*S3NA-004-PR Incident Reporting*).

4.6.2 Except for transportation by aircraft, a carrier must notify DOT by telephone when any serious hazardous material incident (defined in 49 CFR 171.15) occurs during the course of loading, unloading, transportation, or temporary storage. Reports are to be made by telephone at the earliest practical moment. The nearest FAA Civil Aviation Security Office may be notified in place of the DOT if the incident involves shipment transported by aircraft.

4.6.3 A carrier must file a written report of the hazardous material incident in addition to telephone notification. The report must be completed using DOT's Hazardous Materials Incident Report (DOT Form F 5800.1) and submitted within 30 days of the incident's discovery to the Research and Special Programs Administration (RSPA) or the nearest FAA Civil Aviation Security Office if the incident involved transportation by aircraft.

4.6.4 As required by the AECOM incident reporting requirements, an initial telephone report is required whenever any of the following occurs during the course of transportation in commerce (including loading, unloading, and temporary storage) from the shipping of hazardous materials by AECOM personnel: As a direct result of a hazardous material:

- A person is killed;
- A person receives an injury requiring admittance to a hospital;
- The general public is evacuated for one hour or more;
- A major transportation artery or facility is closed or shut down for one hour or more; or
- The operational flight pattern or routine of an aircraft is altered;
- Fire, breakage, spillage or suspected radioactive contamination occurs involving a radioactive material (see also the DOT regulations at 49 CFR § 176.48);
- Fire, breakage, spillage or suspected contamination occurs involving an infectious substance other than a regulated medical waste;
- A release of a marine pollutant occurs in a quantity exceeding 450 L (119 gallons) for a liquid or 400 kg (882 pounds) for a solid; or
- A situation exists of such a nature (e.g., a continuing danger to life exists at the scene of the incident) that, in the judgment of the person in possession of the hazardous material, it should be reported to the NRC even though it does not meet the criteria of paragraph (b) (1), (2), (3) or (4) of this section.

S3NA-509-PR Hazardous Waste Operations and Emergency Response Activities

1.0 Purpose and Scope

- 1.1 Provides requirements for AECOM operations pertaining to hazardous waste and emergency response (HAZWOPER) services.
- 1.2 This procedure applies to all AECOM North America-based employees and operations.
- 1.3 In Canada there is no direct federal or provincial counterpart to HAZWOPER; however, as due diligence and in compliance with applicable provincial duty of care/general duty clauses, staff working in Canada will comply with this procedure.

2.0 Terms and Definitions

- 2.1 **Emergency Response:** A response effort by employees from outside the immediate release area or by other designated responders (i.e., mutual-aid groups, local fire departments, etc.) to an occurrence that results, or is likely to result, in an uncontrollable release of a hazardous substance. Responses to incidental release of hazardous substances where the substance can be absorbed, neutralized, or otherwise controlled at the time of release by employees in the immediate release area or by maintenance personnel are not considered to be emergency responses within the scope of the HAZWOPER standard. Responses to releases of hazardous substances where there is no potential safety or health hazard are not considered to be emergency responses.
- 2.2 **Health and Safety Plan:** A document prepared for each project that contains site-specific information including the Emergency Response Plan for the project.
- 2.3 **Incident Command System (ICS):** ICS is a standardized on-scene incident management concept designed specifically to allow responders to adopt an integrated organizational structure equal to the complexity and demands of any single incident or multiple incidents without being hindered by jurisdictional boundaries. In the ICS the first person responding to an incident becomes the Incident Commander and turns that title and duties over to more qualified responders as they arrive on scene.
- 2.4 **First Responder:** First responders are individuals who are likely to witness or discover a hazardous substance release, injury, fire, or other incident and who have been trained to initiate an emergency response sequence by notifying the proper authorities of the release. They would take no further action beyond first aid, initial control of the incident, and notifying the authorities and others of the incident.
- 2.5 **Hazardous Materials Specialist:** Hazardous materials specialists are individuals who respond with and provide support to hazardous materials technicians. Their duties parallel those of the hazardous materials technician; however, those duties require a more directed or specific knowledge of the various substances they may be called upon to contain. The hazardous materials specialist would also act as the site liaison with federal, state, local, and other government authorities in regards to site activities.
- 2.6 **Hazardous Materials Technician:** Hazardous materials technicians are individuals who respond to releases or potential releases for the purpose of stopping the release. They assume a more aggressive role than a first responder in that they will approach the point of release in order to plug, patch, or otherwise stop the release of a hazardous substance.
- 2.7 **Incident Commander:** The Incident Commander (IC) is responsible for all aspects of the response, including developing incident objectives and managing all incident operations. The title and responsibilities are typically assumed by a qualified IC from the client or public sector.
- 2.8 **Hazardous Waste:** Hazardous waste is waste that is dangerous or potentially harmful to our health or the environment. Hazardous wastes can be liquids, solids, gases, or sludges. They can be

discarded commercial products, like cleaning fluids or pesticides, or the byproducts of manufacturing processes. Hazardous waste are divided into

- 2.8.1 Listed wastes (<http://www.epa.gov/osw/hazard/wastetypes/listed.htm>),
- 2.8.2 Characteristic wastes (<http://www.epa.gov/osw/hazard/wastetypes/characteristic.htm>),
- 2.8.3 Universal wastes (<http://www.epa.gov/osw/hazard/wastetypes/universal/index.htm#wastes>), and
- 2.8.4 Mixed wastes
- 2.8.5 Specific procedures determine how waste is identified (<http://www.epa.gov/osw/hazard/wastetypes/wasteid/index.htm>), classified, listed, and delisted.
- 2.9 **Hazardous Materials:** A hazardous material is any item or agent (biological, chemical, physical) that has the potential to cause harm to humans, animals, or the environment, either by itself or through interaction with other factors. Additionally a hazardous material may be defined as any substance or chemical which is a "health hazard" or "physical hazard," including chemicals that are carcinogens, toxic agents, irritants, corrosives, sensitizers; agents that act on the hematopoietic system; agents that damage the lungs, skin, eyes, or mucous membranes; chemicals that are combustible, explosive, flammable, oxidizers, pyrophorics, unstable-reactive, or water-reactive; and chemicals that in the course of normal handling, use, or storage may produce or release dusts, gases, fumes, vapors, mists, or smoke that may have any of the previously mentioned characteristics. This may be caused when released by spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping, leaching, dumping, disposing into the environment, by being transported or moved, and items or chemicals that are "special nuclear source" or byproduct materials or radioactive substances.

4.0 Procedure

4.1 Roles and Responsibilities

- 4.1.1 **Region Operations Managers** and **District Managers** shall be responsible for the following:
 - Provide support to the implementation of Health and Safety Plans and Emergency Action Plans.
- 4.1.2 **Project managers** shall be responsible for the following:
 - Prepare or request a HASP for every AECOM project.
 - Verify that all personnel working on the project are qualified.
 - Request client's emergency response procedures.
 - Appoint a **Site Safety Officer (SSO)** for each project.
 - Communicate the site-specific emergency response details to all employees assigned to a field project.
 - Confirm that the necessary communications equipment for the project is available.
 - Confirm that an accident/incident investigation is performed and a report is filed.
- 4.1.3 **Region SH&E Managers** shall be responsible for the following:
 - Provide technical guidance for the development and implementation of Health and Safety Plans and Emergency Action Plans.
 - Prepare emergency action plans as part of project HASPs and emergency reference sheets.
 - Interface with the local emergency responders when necessary.
 - Interface with clients regarding facility emergency response procedures.

4.1.4 Site Safety Officer is responsible for the following:

- Verify that a HASP is available for the project.
- Communicate the site-specific emergency response details to all **employees** assigned to a field project.
- Stop work and initiate emergency response procedures as required.
- Account for all AECOM and subcontractor employees after site evacuation.
- Conduct pre-entry briefing and daily tailgate meetings and review facility and site-specific emergency procedures.
- Brief on-site and off-site responders in the event of an emergency.

4.1.5 Employees

- Maintain HAZWOPER training.
- Follow the HASP and emergency procedures prepared for the project.
- Initiate emergency response via verbal communications or the alarm system if first to encounter the emergency.

4.1.6 All personnel (e.g., AECOM **employees**, general laborers, equipment operators, chemists, supervisors, etc.) performing activities at hazardous waste sites that expose or potentially expose them to hazardous wastes and health hazards are considered HAZWOPER site workers and must meet the training and medical surveillance requirements specified in 29 CFR 1910.120(e) and (f), respectively. Additional training may be required based on site activities including related exposures and risks (e.g., confined space entry, excavations, fall protection, other materials [lead], etc.). These additional training requirements are to be outlined in the project- or site-specific health and safety plan (HASP).**4.2 Personnel Qualifications—Medical Surveillance and Training****4.2.1** HAZWOPER-qualified employees will participate in the following medical surveillance and training requirements.**4.2.2** Medical Surveillance

- Specific HAZWOPER medical examination protocols have been developed by **AECOM's Corporate Medical Provider (CMP)** to meet the requirements of 29 CFR 1910.120(f). To be medically qualified to perform HAZWOPER work, **employees** receive the following medical examinations:
 - Initial (Baseline) Examination—The initial examination is part of pre-employment requirements and must be completed (with results received) prior to the employee's start of work date.
 - Annual Examination—HAZWOPER-qualified **employees** will complete a medical examination once each year. Medical qualification expires on the anniversary date of the last examination completed. There will be no "grace period" exemptions beyond this date without the express approval of the **Region SH&E Manager**. At the recommendation of the **SH&E Department**, the **CMP** may approve an alternate examination frequency at periods of up to two years (biennial) in cases in which the worker's exposures to environmental contaminants are infrequent and typically well below any occupational exposure limits (e.g., senior management personnel).
 - Termination Examination—When reassigned to non-HAZWOPER duties, or at the conclusion of employment at AECOM, HAZWOPER-qualified personnel will be provided with the opportunity to receive a termination medical examination.
 - Special Examinations—The SH&E Department and the CMP will jointly determine the need for special examinations because of
 - Unusual exposure conditions.
 - In response to possible overexposures.
- The **CMP** will determine the medical protocol elements for each of these examinations based on exposure information provided by the **SH&E Department**. The **CMP** will evaluate the results of each employee's examination and will provide a written statement of medical clearance

clearly stating medical compliance with the HAZWOPER regulatory standard (29 CFR 1910.120(f)) and approval of the employee to perform unrestricted HAZWOPER activities. for initial and annual examinations, the **CMP** will also evaluate the **employee** for the use of air purifying and supplied air respiratory protection. The written evaluation from these examinations will indicate the **CMP's** approval/limitations on the employee's use of respiratory protection.

4.2.3 AECOM Training

- All personnel assigned to work at a hazardous waste site must participate in training meeting the requirements of 29 CFR 1910.120(e).
- Initial 40-Hour Training—Before being assigned to a HAZWOPER site, AECOM employees must complete 40 hours of off-site training meeting the requirements of 29 CFR 1910.120(e)(3)(i). At the conclusion of training, personnel will receive a written certification of course completion, signed by the instructor, that indicates the course of instruction (40-hour HAZWOPER) and training dates. A copy of this certification must be provided to the employee's SH&E Coordinator. **Employees** are responsible for maintaining their own copy of this certificate and for presenting it to the site supervisor when working on any HAZWOPER site.
- In addition to the initial 40-hour training, the **employee** must receive three days of actual supervision by a trained experienced supervisor.
 - Available Training Sources:
 - On-site training provided by the SH&E Department.
 - Outsourced training providers approved by the SH&E Department.
- Refresher 8-Hour Training—To remain qualified to perform on-site HAZWOPER work activities, each AECOM **employee** will complete 8 hours of HAZWOPER refresher training meeting the requirements of 29 CFR 1910.120(e)(8) at yearly intervals following completion of Initial 40-hour training. At the conclusion of training, personnel will receive a written certification of course completion, signed by the instructor, that indicates the course of instruction (8-hour HAZWOPER Refresher) and the training date. A copy of this certification must be provided to the employee's SH&E Coordinator. **Employees** are responsible for maintaining their own copy of this certificate and for presenting it to the site supervisor when working on any HAZWOPER site.
 - Available Training Sources:
 - Internet-based training approved by **SH&E Department**
 - On-site training provided by the **SH&E Department**
 - Outsourced training providers approved by the **SH&E Department**
- Supervisor 8-Hour Training—Any AECOM employee acting in a management capacity for HAZWOPER activities (e.g., project management personnel, field managers/foremen, site safety officers, etc.) must complete an additional 8 hours of HAZWOPER Supervisor training meeting the requirements of 29 CFR 1910.120(e)(4). Although this training is required only once, supervisors must maintain their overall HAZWOPER qualification through annual completion of refresher training. At the conclusion of Supervisor 8-Hour Training personnel will receive a written certification of course completion, signed by the instructor, that indicates the course of instruction and the training date. A copy of this certification must be provided to the employee's SH&E coordinator. **Employees** are responsible for maintaining their own copy of this certificate and for presenting it to the senior site supervisor when working on any HAZWOPER site.
 - Available Training Sources:
 - On-site training provided by the **SH&E Department**
 - Outsourced training providers approved by the **SH&E Department**
- 24-Hour HAZWOPER Training—Site support contractors and site visitors may qualify to substitute 24-hour HAZWOPER training in place of 40-hour training, as specified in 29 CFR 1910.120(e)(3)(ii). Personnel potentially qualifying for this alternative training include:
 - Site support personnel who will not work in any Exclusion Zone areas.
- Subcontractors and site visitors whose duties will not entail significant exposure to site contaminants defined as not working in any areas where airborne contaminant concentrations

exceed one-half of any applicable occupational exposure limit, and no contact or exposure to materials with site contaminant concentrations exceeding natural background levels. The **Region SH&E Manager** or **SH&E department** designee must approve the substitution of 24-hour training for initial 40-hour training. Persons qualifying for 24-hour training must provide written certification of course completion prior to beginning work on site. Persons completing 24-hour training must complete 8 hours of annual refresher training at the required interval to maintain eligibility for on-site work and must provide proof of this training (as necessary to demonstrate retraining) prior to beginning work on site.

4.2.4 Subcontractor Personnel

Any subcontractor organization whose employees will support AECOM operations at a HAZWOPER site will:

- Provide the **AECOM Project Manager** with a copy of their written HAZWOPER medical surveillance and training program requirements. The elements of the program(s) must be similar to those for AECOM's own program, as detailed above.
- Provide the **Project Manager** with written certification of a physician's approved medical clearance for each employee who will work on the site. Certification can be demonstrated by:
 - A copy of the physician's signed medical clearance for each **employee** (preferred), or
 - A letter identifying the medical status and clearance expiration date of every **employee**, signed by the company's safety director or an officer of the company.
 - A copy of the each employee's training certifications, which will include:
 - The initial 40-hour training certificate (24-hour training may be substituted with SH&E department approval).
 - The most current Refresher training certificate (must be current within the previous one-year period).
 - A copy of the Supervisor training certificate for each person serving in a site supervisory capacity (e.g., **field managers/foremen, site safety officers**, etc.).

4.3 Project SH&E Documentation—Health and Safety Plans

4.3.1 The project SH&E documentation prepared for HAZWOPER activities is referred to as a site-specific Health and Safety Plan (HASP), and must meet the requirements presented in 29 CFR 1910.120(b)(4).

4.3.2 The required plan elements include:

- A description of the work location, the site history, and a summary of any information available concerning site hazards (including both physical hazards and contamination conditions).
- A summary of the work activities to be performed under AECOM's scope of activities.
- A safety and health risk or hazard analysis for each on-site task that will be performed. Identified risks must include both chemical and physical hazards to which personnel may be exposed during the conduct of the work task.
- Protective measures for each work task to prevent or mitigate the potential hazards identified in the hazard analyses.
- Personal protective equipment (PPE) requirements for each work task.
- Frequency and types of air monitoring, personal monitoring, and environmental sampling techniques and instrumentation to be used.
- Site control measures.
- Decontamination procedures.
- An emergency response plan, *S3NA-509-FM4 Emergency Information and Hazard Assessment*, addressing actions to be taken in the event of each type of credible incident that might result during the performance of planned work activities, including minor and major injuries, and chemical release and fire. Response plans must address the means for coordinating the evacuation of all on-site personnel in the event of a catastrophic incident.

- 4.3.3 Responsibility for development of each AECOM HASP will be coordinated between the **Project Manager** and the **Region SH&E Manager** or **SH&E Department** designee as part of project initiation. Regardless of where the HASP is developed, it will be reviewed and approved by the **SH&E Department** prior to submission to any agency outside of AECOM.

4.4 **Contractors and Subcontractors**

- 4.4.1 The health and safety of any contractor's or subcontractor's employees is solely the responsibility of that contractor or subcontractor, who shall evaluate the hazards and potential hazards to their own employees and shall adhere to their own Health and Safety Plan.
- 4.4.2 In addition, all AECOM subcontractors' Health and Safety Plans will, at a minimum conform to the requirements of the AECOM Health and Safety Plan. The AECOM Health and Safety Plan does not, nor is it intended to, address procedures of contractors or subcontractors during their site activities.

4.5 **Field Emergency Response Plans**

- 4.5.1 AECOM employees are not expected to take action or to participate in rescues or responses to chemical releases beyond the initial discovery of the release and immediate mitigation actions such as closing a valve, placing absorbents, and notifying the client and or public emergency response system (911.) If AECOM employees are to participate in the response to a chemical release beyond the initial reaction, there must be a contractual provision for this response and the employees must be specifically trained for this response. This document is designed to provide guidelines on how to prepare a written plan that will ensure prompt and proper response to an emergency situation that arises during field investigations and to outline the duties of AECOM employees during a field emergency and the associated training requirements.
- 4.5.2 Site specific health and safety plans that are prepared to comply with the HAZWOPER standard (29 CFR 1910.120) must address emergency response. This standard specifically outlines the elements that must be contained in an emergency response plan. However, the definition of emergency response, as written in 29 CFR 1910.120, focuses on emergencies involving the uncontrolled release of hazardous substances. Under 29 CFR 1910.120, an employer can opt to evacuate employees from the danger area when such an emergency occurs. AECOM does not expect its employees to actively assist in the handling of uncontrollable chemical releases that may occur during the implementation of field programs. As such, and as provided by the HAZWOPER standard, AECOM is exempt from the emergency response plan requirements of the standard as long as it provides an emergency action plan within the HASP that complies with 29 CFR 1910.38 (a). Therefore, all emergency response plans required under 29 CFR 1910.120 will be written to comply with 29 CFR 1910.38 (a).
- 4.5.3 The HAZWOPER standard does not prohibit AECOM employees from performing limited response activities. AECOM employees can provide response assistance by placing absorbent pillows or vermiculite around a small, contained spill that occurs during sampling efforts. AECOM's SH&E SOP 203—*Spill Containment Program*, describes the specific procedures that AECOM will follow when responding to an incidental chemical spill.
- 4.5.4 Field Project Preparation
- Every HASP that is prepared by AECOM will contain an emergency response section in which the required elements of an emergency action plan will be contained. For all projects that do not require a HASP, an emergency reference sheet will be prepared; minimally, the sheet will list the telephone numbers of the local emergency responders and the local hospital and provides directions to the local hospital. When AECOM is working at an operating facility, the emergency response procedures of the facility will be appended to the HASP or the emergency reference sheet.
 - There are two types of emergency situations that AECOM personnel must be prepared for and that must be addressed in the emergency action plan. These include:
 - Emergencies related to the operations of our clients at the facility where AECOM is working.
 - Emergencies related to our own on-site activities/investigations.
 - AECOM employees are typically not expected to take action or participate in responses to chemical releases beyond the initial discovery of the release and immediate mitigation actions such as closing a valve, placing absorbents, and notifying the client and or public emergency response system (911.)

- AECOM **employees** are not to accept the role of Incident Commander without specific authority from the **Region SH&E Manager** and the General Operations Manager responsible for the project. Assuming the role of the Incident Commander requires training beyond the scope of this Procedure.

4.5.5 Client Facility Emergency Response Procedures

- AECOM implements field programs on active properties, including manufacturing facilities. These facilities have typically developed an emergency response plan that is specific to facility-related emergencies. If AECOM is working at an operating facility, emergency procedures established by the facility must be followed in the event of a facility catastrophe. AECOM personnel must be aware of and familiar with the alarm signals used at the facility to alert personnel to an emergency. AECOM personnel must also know where to assemble in the event of a facility evacuation as the facility must be able to account for all personnel, including subcontractors such as AECOM in the event of an evacuation.
- The first priority in AECOM's preparation of a project emergency action plan is to ensure that the responsibilities under the client's emergency response plan are fully understood. Because of the nature of their business, many of our clients have in-house fire brigades, medical staff, and hazardous materials teams that can assist AECOM in the event of an emergency related to our field activities. In many instances, our clients prefer or require that subcontractors seek emergency assistance through their facility first before calling outside responders to the site.
- A copy of the facility's procedures must be made available to AECOM so that the information can be incorporated into the HASP or attached to the emergency reference sheet. If this information is not available to AECOM prior to arriving on site, the SSO must meet with client representatives upon arrival to the facility to review procedures in the event of an emergency related to plant operations.

4.5.6 Emergency Action Plan

- As a minimum, each emergency action plan must contain the following topics as required by 29 CFR 1910.38 (a):
 - Procedures and contact information for reporting emergencies to public service responders and on-site (client or host employer) emergency control centers.
 - Emergency escape procedures and emergency escape route assignments.
 - Procedures to be followed by employees who remain to operate critical site operations before they evacuate.
 - Procedures to account for all employees after emergency evacuation is complete.
 - Rescue and medical duties for those employees who are to perform them.
 - Preferred means of reporting fires and other emergencies.
 - PPE to protect employees from expected exposures and potential exposures during an emergency.
 - Names of persons or departments who can be contacted for further information (i.e. emergency reference sheet).
 - Availability of medical surveillance for workers who might have been exposed to chemicals, bloodborne pathogens, or other biological agents as a result of project work or emergency response.
- In addition, each plan must establish the specific alarm system that will be used on site to warn employees of an AECOM emergency. The chosen alarm signals should not conflict with alarm signals already in place at the facility.

4.5.7 Escape Routes and Procedures

- Prior to the commencement of on-site activities, the **SSO** must determine how AECOM employees will evacuate each AECOM work area of the site. Two or more routes that are separate or remote from each other for each work area must be identified. Multiple routes are necessary in case one is blocked by fire or chemical spill. These routes must not overlap because, if a common point were obstructed, all intersecting routes would be blocked.

- Prominent wind direction should also be considered when designating escape routes and assembly areas. Escape routes and assembly areas should be upwind of the site whenever possible.
- Upon arrival to the site, the **SSO** must verify that the selected routes are appropriate for evacuation. During an emergency, the quickest and most direct route should be selected. However, when working at an operating facility, the established escape routes of the facility should be used whenever possible. In the event of a facility-related emergency, all AECOM employees must meet at the facility's assembly area so that the client can verify that AECOM has evacuated the property.

4.5.8 Accounting Method for All Employees after Evacuation

- The **SSO** is responsible for determining that all AECOM employees have been successfully evacuated from the work area(s). It is the responsibility of each AECOM subcontractor to verify that all of its employees evacuated the site and to report this information to the AECOM **SSO**. All employees must meet at the designated assembly area. A headcount is an acceptable way to determine complete evacuation when the field team is of a small size. The site log-in book should be referenced when attempting to account for more than 10 people. In the event of a facility-related emergency, the **SSO** must notify facility representatives that all AECOM employees and AECOM subcontract employees have successfully evacuated the work area(s). The **SSO** must notify emergency responders if any employee is unaccounted for and where on the site they were last seen.
- In the event of a project-related emergency, the SSO will provide off-site emergency responders or on-site HAZMAT teams or fire brigades (Incident Commander) with all available knowledge about the emergency situation upon their arrival to the scene.

4.5.9 Employees Who Remain to Operate Critical Site Operations Before They Evacuate

- All equipment and operations are required to cease in accordance with the established alarm signal procedures. The only exception will be related to health and safety. The **SSO** must determine at the time of the emergency if health and safety will be jeopardized by immediate stoppage of any particular piece of equipment. If such a determination is made, personnel involved in critical operations must be minimized. Once it is determined that the operation is no longer needed or the threat to the operators is imminent, operations will cease and the operators will immediately evacuate.

4.5.10 Rescue and Medical Duties

- Only currently trained individuals will administer first aid or CPR. If the injury is life threatening, the Emergency Medical System (EMS) should be called (911). Depending on the procedures established for the project, the SSO would contact an emergency responder directly or notify the facility representatives for medical assistance. If the employee needs medical attention that can not be provided on-site, the SSO shall escort the individual to the local hospital identified on the emergency reference sheet and shall remain with the person until release or admittance is determined. The escort will relay all appropriate medical information to the Project Manager and Regional SH&E Manager.

4.5.11 Preferred Means of Reporting

- Unless facility representatives specifically indicate that they prefer AECOM personnel to notify them first of an emergency, the **SSO** will directly contact the appropriate emergency responders listed on the emergency reference sheet.

4.5.12 Alarm Signals

- An emergency communication system must be in effect at all sites. The most simple and effective emergency communication system in many situations will be direct verbal communications. However, verbal communications must be supplemented any time voices cannot be clearly perceived above ambient noise levels and any time a clear line of sight can not be easily maintained among all AECOM personnel because of distance, terrain, or other obstructions.
- Portable two-way radio communications may be used when employees must work out of the line of sight of other workers.
- When verbal communications must be supplemented, the following emergency signals shall be implemented using handheld portable air horns, whistles, or similar devices. Signals must be

capable of being perceived above ambient noise by all employees in the affected portions of the workplace.

- One Blast: General Warning—A relatively minor and localized, yet important, on-site event. An example of this type of an event would be a minor chemical spill where there is no immediate danger to life or health yet personnel working on the site should be aware of the situation so that unnecessary problems can be avoided. If one horn blast is sounded, personnel must stop all activity and equipment on-site and await further instructions from the SSO.
- Three Blasts: Medical Emergency—A medical emergency for which immediate first aid or emergency medical care is required. If three horn blasts are sounded, all first aid and/or CPR trained personnel should respond as appropriate. All other activity and equipment should stop and personnel should await further instructions from the SSO.
- Three Blasts Followed by One Continuous Blast: Immediate Threat to Life and Health—A situation that could present an immediate danger to life and health of personnel onsite. Examples include fires, explosions, large hazardous chemical release, severe weather-related emergencies, or security threats. If three horn blasts followed by a continuous blast are sounded, all activity and equipment must stop. All personnel must evacuate the site and meet in the designated assembly area where the SSO will account for all employees. The SSO will arrange for other emergency response actions if necessary. Information concerning the need to follow decontamination procedures during an emergency evacuation will be addressed in the emergency action plan.
- The SSO or his designate will acknowledge the distress signal with two short blasts on the air-horn or whistle.
- One Continuous Blast Following Any of the Above: All Clear/Return to Work—Personnel who sound the initial alarm are required to send an all clear signal when the emergency is over.

4.5.13 Emergency Reference Sheet

- An emergency reference sheet (see *S3NA-509-FM4 Emergency Information and Hazard Assessment*) must be prepared for projects not requiring a HASP. Each emergency reference sheet must list the following:
 - Emergency phone numbers for local police, fire, and ambulance service.
 - In-house facility extensions for reporting an emergency (applies to operating facilities only).
 - Phone number and address of closest hospital with an emergency room to the site.
 - Directions to the hospital from the site.
 - Map highlighting the site-to-hospital route.
 - Phone number for the Poison Control Center.
 - Names and phone numbers of AECOM representatives and facility representatives.

4.5.14 On-site and Off-site Communications

- Regardless of the size or location of AECOM's field projects, it is extremely important that both on-site and off-site communications be maintained so that in the event of an emergency employees can contact each other or place a phone call immediately with the appropriate responder(s).
- Walkie-talkies are required when members of the field team are working in separate areas of the site and verbal communications are no longer effective because of distance. A walkie-talkie must be available for each team that is working in a separate area of the site.
- When AECOM is working at an occupied facility, access to a telephone may not be a problem. When AECOM is working on abandoned properties or when there is no access to a phone, a cellular telephone must be brought to the work location.

4.5.15 Evacuation

- Although emergency evacuation procedures are included in AECOM's initial 40-hour HAZWOPER training, emergency procedures at each site will be different. Therefore, employees must be instructed about the specifics of the emergency procedures developed for

the site during the site-specific pre-entry briefing that must be held daily prior to the commencement of field activities. Update training is required anytime escape routes or procedures change. An evacuation drill will be conducted for projects that are scheduled for one month or longer. Visitors and untrained employees shall not be allowed into the project area until they receive a safety briefing including evacuation alarms and procedures.

4.5.16 First Responder

- First responders shall have sufficient training or have had sufficient experience to objectively demonstrate competency in the following areas:
 - An understanding of what hazardous substances are, and the risks associated with them in an incident.
 - An understanding of the potential outcomes associated with an emergency.
 - The ability to recognize the presence of hazardous substances and physical hazards in an emergency.
 - An understanding of the role of the first responder.
 - The ability to realize the need for additional resources and to make appropriate notifications to the communication center.

4.5.17 First Responder HAZWOPER Operations Level

First responders at the operations level are individuals who respond to releases or potential releases of hazardous substances as part of the initial response to the site for the purpose of protecting nearby persons, property, or the environment from the effects of the release. They are trained to respond in a defensive fashion without actually trying to stop the release. Their function is to contain the release from a safe distance, keep it from spreading, and prevent exposures. First responders at the operational level shall have received at least eight hours of training or have had sufficient experience to objectively demonstrate competency in the following areas in addition to those listed for the awareness level and the employer shall so certify:

- Knowledge of the basic hazard and risk assessment techniques.
- Know how to select and use proper personal protective equipment provided to the first responder operational level.
- An understanding of basic hazardous materials terms.
- Know how to perform basic control, containment, and/or confinement operations within the capabilities of the resources and personal protective equipment available with their unit.
- Know how to implement basic decontamination procedures.
- An understanding of the relevant standard operating procedures and termination procedures.

4.5.18 Hazardous Materials Technician

Hazardous materials technicians shall have received at least 24 hours of training equal to the first responder operations level and in addition have competency in the following areas and the employer shall so certify:

- Know how to implement the employer's emergency response plan.
- Know the classification, identification, and verification of known and unknown materials by using field survey instruments and equipment.
- Be able to function within an assigned role in the Incident Command System.
- Know how to select and use proper specialized chemical PPE provided to the hazardous materials technician.
- Understand hazard and risk assessment techniques.
- Be able to perform advance control, containment, and/or confinement operations within the capabilities of the resources and personal protective equipment available with the unit.
- Understand and implement decontamination procedures.
- Understand termination procedures.
- Understand basic chemical and toxicological terminology and behavior.

4.5.19 Hazardous Materials Specialist

Hazardous materials specialists shall have received at least 24 hours of training equal to the technician level and in addition have competency in the following areas and the employer shall so certify:

- Know how to implement the local emergency response plan.
- Understand classification, identification, and verification of known and unknown materials by using advanced survey instruments and equipment.
- Know the state emergency response plan.
- Be able to select and use proper specialized chemical PPE provided to the hazardous materials specialist.
- Understand in-depth hazard and risk techniques.
- Be able to perform specialized control, containment, and/or confinement operations within the capabilities of the resources and personal protective equipment available.
- Be able to determine and implement decontamination procedures.
- Have the ability to develop a site safety and control plan.
- Understand chemical, radiological, and toxicological terminology and behavior.

4.6 Personal Protective Equipment (PPE) Ensembles

4.6.1 Defined HAZWOPER PPE ensembles are specified for general use on all AECOM HAZWOPER operations. The project HASP may specify modifications to these requirements to meet site-specific conditions.

4.6.2 Level D Ensemble

- The Level D ensemble provides a minimal level of skin protection (primarily against physical rather than chemical hazards) and no respiratory protection. Level D PPE is the minimum work uniform which will be used on HAZWOPER sites. Its use is appropriate when there is no significant potential for encountering hazardous substances or health hazards while working in controlled work areas.
- Level D Equipment List
 - Hard hat
 - Eye protection
 - Safety-toe work boots
 - Shirts with sleeves and long pants (shorts are unacceptable for use)
 - Hearing protection (as required)

4.6.3 Modified Level D Ensemble

- The Modified Level D ensemble provides moderate skin protection against contact with hazardous substances, but no respiratory protection. Its use is appropriate where there is a moderate-to-low potential for skin contact with known hazardous substances and health hazards, but no significant inhalation hazard is anticipated. The Modified Level D ensemble will consist of the Level D ensemble, supplemented by the addition of one or more of the following items:
- Modified Level D Equipment List
 - Chemical-resistant disposable outer coveralls
 - Chemical-resistant outer gloves taped to outer coveralls¹
 - Chemical-resistant inner gloves¹
 - Chemical-resistant safety-toe boots (taped to outer coveralls)

4.6.4 Level C Ensemble

¹ Selection of specific glove types/materials will be provided in the project HASP based on consideration of the contaminants and the physical conditions of the work.

- The Level C ensemble provides moderate skin protection against contact with hazardous substances and moderate respiratory protection. Its use is appropriate where there is the potential for skin contact with known hazardous substances and health hazards, together with a limited and well-defined potential for exposure via inhalation.
- Level C Equipment List
 - Full-face air-purifying respirator (APR) equipped with cartridge types as designated in the project HASP2
 - Chemical-resistant disposable outer coveralls
 - Chemical-resistant outer gloves taped to outer coveralls³
 - Chemical-resistant inner gloves³
 - Hard hat
 - Safety-toe boots taped to coveralls; the use of boot covers (e.g., booties) or chemical-resistant boots may be specified
 - Hearing protection (as required)

4.6.5 Level B Ensemble

- The Level B ensemble provides both the highest level of inhalation exposure protection and considerable skin contact protection. Its use is appropriate where there are significant known or suspected hazardous substances and health hazards, involving both skin and inhalation exposure (up to and including Immediately Dangerous to Life or Health [IDLH] conditions) or where adverse atmospheric conditions cannot be mitigated by use of air purifying respirators (e.g., oxygen deficient atmospheres or chemicals with poor warning properties). The use of Level B PPE requires prior approval by the Regional SH&E Manager.
- Level B Equipment List
 - Supplied air respirator (SCBA or air line system with Grade D or better breathing air)
 - Chemical-resistant disposable outer coveralls
 - Chemical-resistant outer glove taped to outer coveralls³
 - Chemical-resistant inner gloves³
 - Hard hat
 - Chemical resistant safety-toe boots taped to coveralls
 - Hearing protection (as required)

4.6.6 Level A Ensemble

- The Level A ensemble provides the highest level of both respiratory and skin protection, up to and including protection against skin contact with vapor-phase contaminants. The use of Level A PPE requires prior approval by the Americas SH&E Director.
- Specific Level A ensemble components will be determined on a case-by-case basis by the SH&E Department.

4.7 Employee Exposure Monitoring

4.7.1 Exposure monitoring at HAZWOPER sites will be conducted to determine explosive and oxygen levels, monitor and control employee exposures to airborne contaminants, and to determine and regulate controlled work area boundaries (e.g., support zone, contamination reduction zone, and exclusion zone) for the protection of non-HAZWOPER workers and the general public.

4.7.2 Direct Reading Exposure Monitoring Requirements

- Explosive levels, oxygen levels, and airborne contaminants present potential hazards to HAZWOPER personnel working within controlled work areas and to non-HAZWOPER workers and the general public present outside the controlled work areas. On-site exposure monitoring

² Selection of specific cartridges will be made by the SH&E Department (or Competent Person – Respiratory Protection as designated by the DSM) based on contaminants present. A cartridge change-out frequency will also be specified in the HASP based on the manufacturer's cartridge performance data.

³ Selection of specific glove types/materials will be provided in the project HASP based on consideration of the contaminants and the physical conditions of the work.

will be utilized to assess the magnitude of these hazards and to provide indications of any necessary control procedures to mitigate unacceptable hazards. *S3NA-509-FM1 Direct Reading Instrument Monitoring Log* will be used to record all monitoring efforts using direct reading instruments and will remain part of the project file.

- Specific exposure monitoring requirements will be established in individual HASPs and will be implemented by the project team(s) subject to the following requirements:
 - Direct reading instrumentation will be used in accordance with the following table:

Direct Reading Instrument	Example Trade Names	Use
Flame Ionization Detector (FID)	OVA	Detection of select organic vapors
Photo ionization detector (PID)	miniRAE, Micro-TIP	Detection of select organic vapors
Portable gas chromatograph	OVA	Detection of select organic vapors
Explosive meter	MSA ALTAIR, QRAE II, BW GasAlert	Determine explosiveness (as a percent of the Lower Explosive Limit [LEL])
Oxygen monitor	MSA ALTAIR, QRAE II, BW GasAlert	Determine oxygen concentration (in percent)
Single gas meters (mono-tox) <ul style="list-style-type: none"> • Hydrogen sulfide • Carbon monoxide • Oxides of nitrogen • Cyanide 		Determine airborne concentrations of selected contaminants (in parts per million)
Colorimetric Detector Tubes	Drager	Determine airborne concentrations of selected contaminants (in parts per million)
Aerosol monitor	Mini-RAM	Determine airborne particulate concentration (in milligrams per cubic meter)

- Selected instruments will be capable of discriminating contaminant concentrations to concentrations of at least one-half of the HASP-specified exposure limit. All direct-reading instrumentation will be calibrated daily as directed by the manufacturer. *S3NA-509-FM2 Instrument Calibration Log* will be used to record instrument calibrations.

4.7.3 Work Area Exposure Monitoring

- Work area exposure monitoring will include breathing zone readings for the maximum exposed worker(s).
- Results will be used to determine adequacy of PPE (especially respiratory protection). Specific criteria for upgrade/downgrade will be established in the HASP.

4.7.4 Perimeter Exposure Monitoring

- Perimeter air samples will be collected when the potential exists for airborne contaminants to migrate off-site.
- Perimeter exposure monitoring will be conducted at locations downwind from the project activities at a minimum (also upwind if the potential exists for offsite contamination to migrate onto the site).
- Sample results will be recorded in a log book or on the sample log form provided in *S3NA-509-FM3 Personal Sampling Data Sheet*

- Records will indicate individual name, SSN (last 4 digits is acceptable), and job/operation at the time of sample collection.
- Samples sent out for independent laboratory analysis will follow chain of custody requirements.
- Exposure results will be posted on site and explained in a safety briefing.
- **Employees** will receive a written statement of results within 15 days of receipt from the laboratory.
- Results of all personal exposure monitoring will be provided to the **SH&E department** for inclusion in the employee medical records.

5.0 Records

- 5.1 All forms and documents generated during a HAZWOPER project will be maintained in the project file.

S3NA-510-PR Hearing Conservation Program

1.0 Purpose and Scope

- 1.1 Establishes procedures to confirm that personal noise exposure remains within acceptable limits and establishes the requirements of an acceptable hearing conservation program.
- 1.2 This procedure applies to all AECOM North America-based employees and operations.

2.0 Terms and Definitions

- 2.1 **Decibel (dB):** Logarithmic unit of measurement of sound level.
- 2.2 **Action Level:** An eight-hour, time-weighted average of 85 decibels measured on the A-scale, slow response, or equivalently; a noise dose of 50 percent.
- 2.3 **Standard Threshold Shift (STS):** When one's hearing threshold has changed (relative to the baseline audiogram) an average of 10 dB or more at 2000, 3000, or 4000 Hz in either ear).
- 2.4 **Noise Reduction Rating (NRR):** The measure, in decibels, of how well a hearing protector reduces noise, as specified by the Environmental Protection Agency.

3.0 Attachments

- 3.1 S3NA-510-FM Site-Specific Hearing Conservation Program
- 3.2 S3NA-510-WI Hearing Protection Guidelines

4.0 Procedure

4.1 Roles and Responsibilities

4.1.1 Region SH&E Managers or their designate

- Provide access to initial and refresher hearing conservation training.
- Inform employees of noise monitoring results when full-shift noise exposure is at or above the action level.
- Designate areas and tasks where employees' exposure is at or above the action level.
- Conduct noise monitoring, as applicable, and support hazardous noise assessment/evaluation efforts.

4.1.2 Project or Office Managers

- Implement the hearing conservation program.
- Confirm that a hazardous noise assessment/evaluation has been conducted.
- Confirm that a hazardous noise assessment/evaluation is conducted when a change in equipment, procedures, or personnel may increase employee exposure to noise.
- Implement engineering controls to reduce noise levels when such measures are considered feasible and when required by regulation.
- Purchase, monitor, and replenish for employees' use a supply of hearing protection devices with a minimum Noise Reduction Rating (NRR) of 26 dBA.
- Confirm that individuals included in the program receive training and that the training meets the criteria outlined in this program.
- Investigate and implement corrective action to all reports of nonconformance with this procedure, including reports of standard threshold shifts or employees' failure to wear hearing protectors in designated areas.

4.1.3 Supervisors

- Maintain an awareness of the noise levels in work areas for which he/she is responsible.
- Place warning signs in areas where sound levels would require the use of hearing protectors.
- Request that a hazardous noise assessment/evaluation be conducted when a change in equipment, procedures, or personnel may increase employee exposure to noise.
- Confirm that all employees are aware of the requirements for hearing protection for any designated area or task.
- Enforce the use of hearing protection by employees in designated areas and for designated tasks.

4.1.4 Employees

- Comply with the requirements of the Hearing Conservation program.
- Wear hearing protection devices in designated areas or for designated tasks.
- Inspect and maintain hearing protection devices.
- Report any suspected change in noise levels of work area to supervisor.
- Report any signs or symptoms experienced that could be the result of overexposure to noise to supervisor.
- Participate in audiometric testing and hearing protection training when required.

4.2 Requirements

- 4.2.1 The requirements of this procedure apply to all locations/facilities/projects where employee noise exposure may equal or exceed 50 percent of the allowable noise dose or Permissible Exposure Limit (PEL). Table 1 provides information relative to the current PEL for noise exposure expressed as a time-weighted average.

Table 1. Permissible Exposure Limit

SOUND LEVEL (dBA)	TIME (hours)
85	8
90	4
95	2
100	1
105	0.5
110	0.25
115	0.125

- 4.2.2 Table 2 provides information relative to the Action Level (or 50 percent allowable noise dose) expressed as a time-weighted average. The action levels outlined in the table below and PELs described in Table 1 are calculated without regard to the protection afforded by the use of hearing protectors.

Table 2. Action Levels for Hearing Conservation Program

SOUND LEVEL (dBA)	TIME (hours)
85	4
90	2
95	1
100	0.5
105	0.25
110	0.125
115	0.0625

4.3 Training Program

4.3.1 All employees with potential exposure above the action levels established in Table 2 of this procedure or who otherwise utilize any type of hearing protector will participate in a hearing conservation training program.

4.3.2 Training Objectives

4.3.3 The initial and subsequent annual hearing conservation training will address, at a minimum, the following topics:

- The effects of noise on hearing, recognizing hazardous noise, and symptoms of overexposure to hazardous noise.
- When and/or where hearing protectors are required to be worn.
- The purpose of hearing protectors.
- The advantages, disadvantages, and effectiveness of various types of protectors.
- Instructions on how to select, use, fit, and care for hearing protectors.
- The purpose of audiometric testing, including an explanation of the test procedures.
- Hearing Conservation Program requirements and responsibilities.

4.3.4 Hearing protection training is conducted biannually for all affected employees or more frequently for employees who do not properly use hearing protectors or otherwise fail to comply with this policy.

4.4 Audiometric Testing

4.4.1 All AECOM personnel with exposure greater than the action level may be enrolled in the medical surveillance program and undergo a baseline audiogram. Thereafter, annual audiograms will be compared with the baseline exam.

4.4.2 Enrolled employees will receive audiograms during their exit physicals.

4.4.3 When a Standard Threshold Shift (STS), as identified by the AECOM Medical Consultant, is noted between the last valid baseline and the annual audiogram, the following steps will be taken:

- A retest will be conducted within 30 days to confirm the STS. The employee will not be exposed to workplace/hobby noise for 14 hours or will be provided with adequate hearing protection prior to testing.
- If the STS persists, ear protection will be upgraded to one with a greater NRR. The minimum NRR will be 26 dBA.
- The employee will be counseled and AECOM will obtain information regarding the employee's possible noise exposure away from the workplace or existing ear pathology.
- Qualified medical personnel will review the audiograms. This group will determine the need for a medical referral.
- The employee will be notified in writing by either the SH&E Department or the AECOM Medical Provider of the STS, within 21 days of determination, as required by regulation.
- The employee's supervisor will be notified of the shift in hearing threshold.

4.4.4 If the employee who has experienced an STS is exposed to 85 dBA for eight hours or 80 dBA for 12 hours, mandatory use of ear protection is required.

4.5 Monitoring of Noise Levels

4.5.1 As deemed necessary by an SH&E Professional, or a Project Safety Plan AECOM will periodically monitor personal and area noise levels using noise dosimetry and/or sound level meters.

4.6 Hearing Protectors

4.6.1 Selection of appropriate hearing protectors must be based on actual or anticipated exposure levels. At a minimum, hearing protectors must provide a level of protection that brings actual or anticipated exposure below the PEL established for the time period shown in the table above. Additional information relative to hearing protector use is as follows:

- Hearing protection will be mandatory for all employees exposed to 85 dBA for eight hours.

- Hearing protection will be mandatory for all employees working in any area that has not been evaluated for noise exposure and the ambient noise level in the area is such that you must raise your voice to have a normal conversation with someone less than four feet from you and/or when within 25 feet of an operating piece of heavy equipment.
- Hearing protection will be mandatory for all employees who work on or near heavy equipment unless personal dosimetry or other techniques have been used to document actual exposure.
- Hearing protectors will be made available to all employees who may be exposed to 85 dBA for eight hours.
- Hearing protection will be mandatory for all employees exposed to 85 dBA for any period of time and who have experienced an STS.

5.0 Records

- 5.1.1 Noise exposure measurement records will be retained for three years at the project/facility.
- 5.1.2 Audiogram records will be retained in the employee's medical records as per AECOM's Medical Surveillance Procedure for a period as directed by regulation or AECOM's Medical Provider.
- 5.1.3 Employee training session documentation will be retained for the duration of employment.

6.0 References

- 6.1 None

S3NA-510-FM Site-Specific Hearing Conservation Program

Site (Project)

1.0 Monitoring

As per regulation, noise monitoring will be conducted by the following procedure:

Such monitoring will consist of *(check those that apply)*:

☐ Noise Dosimetry

☐ Sound Level Meter Survey

Specific instrumentation to be used is (make/model):

Make	Model

and will be calibrated at a frequency of and documented in the .

Monitoring strategy is as follows *(list all equipment and activities on site that may involve sound pressure levels above 80 dBA and an explanation of the strategy to document actual exposures)*:

Area/Equipment	Monitoring Strategy

Where areas or equipment are not clearly identified, all monitoring will be documented utilizing an illustrated layout *(attach form developed for the specific site)*. Monitoring frequency will be in accordance with the strategy outlined above and when the following changes in site conditions/activities occur:

1.
2.
3.
4.
5.

2.0 Employee Notification

All site employees exposed above the regulated action level (85 dBA – 8 hour TWA) will be notified of the monitoring results by *(insert name/title)* at an interval not to exceed after completion of monitoring.

Notification shall be written, with a copy to the SH&E Department. Documentation of employee notifications and corresponding signatures of notified employees will be kept in the site health and safety logbook/files.

3.0 Observation of Monitoring

All employees affected by the monitoring, or a designated employee representative, shall be given the opportunity to observe noise monitoring procedures. This will be achieved by:

4.0 Audiometric Testing Program and Requirements

AECOM personnel who perform field activities where noise exposure above action levels is expected are required to participate in an audiometric testing program. Additionally, any subcontractors performing work on AECOM projects where noise levels exceeding action level will be required to provide documentation that they participate in an audiometric testing program that meets the applicable regulations. Documentation of participation in the testing program will be maintained by and will be located at .

5.0 Hearing Protectors and Estimating Attenuation

A selection of suitable hearing protectors will be made available to all employees who are expected to have 8-hour TWA noise exposures above 85 dBA. The types anticipated to be available include:

Protection Type	Attenuation

Hearing protector attenuation will be evaluated by for specific noise environments according to the following method prior to determining their suitability for use:

1.
2.
3.

The following site personnel will be required to wear hearing protectors during specific activities and the results of site-specific monitoring conducted in accordance with this procedure. *(This section can be completed after monitoring, if necessary).*

Employee Name	Activity Type	Type of Protection

Hearing protectors will be properly fitted by _____ upon initial distribution to site workers.

Training in the use and care of hearing protectors shall be conducted by _____ during the initial site-specific health and safety training. Training contents shall meet the requirements set forth in this procedure and the applicable regulations.

Hearing protectors will be distributed by _____ from the storage location at the _____.

6.0 Access to Information and Training Materials

All information required by regulation to be made available to the employees will be posted by (*insert name/title*) _____ at the _____.

Local Occupational Health and Safety Regulations will also be kept on site.

7.0 Recordkeeping

Records required by AECOM's Hearing Conservation Program and Regulations shall be completed by _____ and shall be maintained at the _____ and placed on permanent file at the _____ for the minimum duration required by the standard. Employees can access their individual records by contacting _____.

All records required by this section will be transferred to any employee's successive employer if AECOM ceases to do business.

8.0 Approvals

Project Manager: _____ Date: _____

SH&E Representative: _____ Date: _____

S3NA-510-WI Hearing Protection Guidelines

1.0 Comparison

Comparison of Hearing Protection	
Ear Plugs	Ear Muffs
Advantages: <ul style="list-style-type: none"> • small and easily carried • convenient to use with other personal protection equipment (can be worn with ear muffs) • more comfortable for long-term wear in hot, humid work areas • convenient for use in confined work areas 	Advantages: <ul style="list-style-type: none"> • less attenuation variability among users • designed so that one size fits most head sizes • easily seen at a distance to assist in the monitoring of their use • not easily misplaced or lost • may be worn with minor ear infections
Disadvantages: <ul style="list-style-type: none"> • requires more time to fit • more difficult to insert and remove • require good hygiene practices • may irritate the ear canal • easily misplaced • more difficult to see and monitor usage 	Disadvantages: <ul style="list-style-type: none"> • less portable and heavier • more inconvenient for use with other personal protective equipment • more uncomfortable in hot, humid work area • more inconvenient for use in confined work areas • may interfere with the wearing of safety or prescription glasses; wearing glasses results in breaking the seal between the ear muff and the skin and results in decreased hearing protection

2.0 Care and Use

- 2.1 Follow the manufacturer's instructions.
- 2.2 Check hearing protection regularly for wear and tear.
- 2.3 Replace ear cushions or plugs that are no longer pliable.
- 2.4 Replace a unit when head bands are so stretched that they do not keep ear cushions snugly against the head.
- 2.5 Disassemble ear muffs to clean.
- 2.6 Wash ear muffs with a mild liquid detergent in warm water, and then rinse in clear warm water. Sound-attenuating material inside the ear cushions must not get wet.
- 2.7 Use a soft brush to remove skin oil and dirt that can harden ear cushions.
- 2.8 Squeeze excess moisture from the plugs or cushions and then place them on a clean surface to air dry.

S3NA-511-PR Heat Stress

1.0 Purpose and Scope

- 1.1 Establishes a heat stress prevention program to help ensure that employees know and recognize the symptoms of heat stress-related illnesses and are prepared to take appropriate corrective action.
- 1.2 This procedure applies to all AECOM North America-based employees and operations.

2.0 Terms and Definitions

- 2.1 **Acclimated:** Workers who have developed physiological adaptation to hot environments characterized by increased sweating efficiency, circulation stability, and tolerance of high temperatures without stress. Acclimatization occurs after 7 to 10 consecutive days of exposure to heat and much of its benefit may be lost if exposure to hot environments is discontinued for a week.
- 2.2 **Chemical Protective Clothing (CPC):** Apparel that is constructed of relatively impermeable materials intended to act as a barrier to physical contact of the worker with potentially hazardous materials in the workplace. Such materials include: Tyvek® coveralls (all types) and polyvinyl chloride (PVC) coveralls and rain suits.
- 2.3 **Unacclimated:** Workers who have not been exposed to hot work conditions for one week or more or who have become heat-intolerant due to illness or other reasons.
- 2.4 **Heat Cramps:** A form of heat stress brought on by profuse sweating and the resultant loss of salt from the body.
- 2.5 **Heat Exhaustion:** A form of heat stress brought about by the pooling of blood in the vessels of the skin and in the extremities.
- 2.6 **Heat Rash:** A heat-induced condition characterized by a red, bumpy rash with severe itching.
- 2.7 **Heat Stress.** The combination of environmental and physical work factors that constitute the total heat load imposed on the body.
- 2.8 **Heat Stroke:** The most serious form of heat stress, which involves a profound disturbance of the body's heat-regulating mechanism.
- 2.9 **Sunburn:** Is caused by unprotected exposure to ultraviolet light that is damaging to the skin. The injury is characterized by red painful skin, blisters, and/or peeling.

3.0 Attachments

- 3.1 S3NA-511-FM Heat Stress Monitoring Log
- 3.2 S3NA-511-WI1 Temperature Thresholds
- 3.3 S3NA-511-WI2 Symptoms and Treatment
- 3.4 S3NA-511-ST Heat Exposure

4.0 Procedures

4.1 Restrictions

- 4.1.1 Staff working in extreme heat or sun for extended periods of time away from a shelter or vehicle must not work alone.
- 4.1.2 Staff shall not be exposed to levels that exceed those listed in the screening criteria for heat stress exposure in the heat stress and strain section of the ACGIH Standard.
- 4.1.3 Clothing corrections shall be applied in accordance with the heat stress and strain section of the ACGIH Standard.

4.2 Roles and Responsibilities

4.2.1 Project Managers'/field task managers' responsibilities:

- Evaluate the need for heat stress prevention measures and incorporate as appropriate into the Health and Safety Plan.
- Implement heat stress prevention measures, as applicable, at each work site.
- Develop/coordinate a work-rest schedule, as applicable.
- Ensure heat stress hazard assessments/evaluations were completed for the planned activities.
- Assign personnel physically capable of performing the assigned tasks.
- Ensure that personnel are properly trained in the recognition of heat stress-related symptoms.

4.2.2 Region SH&E Managers' responsibilities:

- Provide heat stress awareness training.
- Assist project teams develop appropriate work-rest schedules.
- Conduct/support incident investigations related to potential heat stress-related illnesses.

4.2.3 Site Supervisors' responsibilities:

- Identify those tasks that may be most impacted by heat stress and communicate the hazard to the assigned employees.
- Ensure that employees have been trained on the recognition of heat stress-related illness.
- Ensure that adequate supplies of appropriate fluids are readily available to employees.
- Ensure that a proper rest area is available.
- Conduct heat stress monitoring, as applicable.
- Implement the work-rest schedule.
- Ensure that first aid measures are implemented once heat stress symptoms are identified.
- Ensure personnel are physically capable of performing the assigned tasks and are not in a physically compromised condition.
- Report all suspected heat stress-related illnesses.

4.2.4 Employees' responsibilities:

- Observe each other for the early symptoms of heat stress-related illnesses.
- Maintain an adequate intake of available fluids.
- Be familiar with heat stress hazards, predisposing factors, and preventative measures.
- Report to work in a properly rested and hydrated condition.
- Report all suspected heat stress-related illnesses.

4.3 Controls

4.3.1 If staff are or may be exposed, the supervisor shall:

- Conduct a heat stress assessment to determine the potential for hazardous exposure of workers, and
- Develop and implement a heat stress exposure control plan.

4.3.2 If staff are or may be exposed, the supervisor shall implement engineering controls (e.g., shelters, cooling devices, etc.) to reduce the exposure of staff to levels below those listed in the screening criteria for heat stress exposure in the heat stress and strain section of the ACGIH Standard.

4.3.3 If engineering controls are not practicable, the supervisor shall reduce the exposure of workers to levels below those listed in the screening criteria for heat stress exposure in the heat stress and strain section of the ACGIH Standard by providing administrative controls, including a work-rest cycle or personal protective equipment, if the equipment provides protection equally effective as administrative controls.

4.3.4 If staff are or may be exposed, the supervisor shall provide and maintain an adequate supply of cool, potable water close to the work area for the use of a heat exposed worker.

4.3.5 If a staff person shows signs or reports symptoms of heat stress or strain, they shall be removed from the hot environment and treated by an appropriate first aid attendant, if available, or by a physician.

- 4.3.6 Heat stress can be a significant field site hazard, especially for workers wearing CPC. The workforce will gradually work up to a full workload under potentially stressful conditions to allow for proper acclimation.
- 4.3.7 Site personnel shall be instructed in the recognition of heat stress symptoms, the first aid treatment procedures for severe heat stress, and the prevention of heat stress injuries. Workers must be encouraged to immediately report any heat stress that they may experience or observe in fellow workers. Supervisors must use such information to adjust the work-rest schedule to accommodate such problems.
- 4.3.8 Wherever possible, a designated break area should be established in an air conditioned space, or in shaded areas where air conditioning is impractical. The break area should be equipped to allow workers to loosen or remove protective clothing, and sufficient seating should be available for all personnel. During breaks, workers must be encouraged to drink plenty of water or other liquids, even if not thirsty, to replace lost fluids and to help cool off. Cool water should be available at all times in the break area, and in the work area itself unless hygiene/chemical exposure issues prevent it.

4.4 **Symptoms and Treatment**

- 4.4.1 Workers who exhibit ANY signs of significant heat stress (e.g., profuse sweating, confusion and irritability, pale, clammy skin), shall be relieved of all duties at once, made to rest in a cool location, and provided with large amounts of cool water.
- 4.4.2 Anyone exhibiting symptoms of heat stroke (red, dry skin, or unconsciousness) must be taken immediately to the nearest medical facility, taking steps to cool the person during transportation (clothing removal, wet the skin, air conditioning, etc.).
- 4.4.3 Severe heat stress (heat stroke) is a life-threatening condition that must be treated by a competent medical authority.

4.5 **Prevention**

- 4.5.1 All staff working in extreme heat or sun should understand the following guidelines for preventing and detecting heat exhaustion and heat stroke.
- If you experience heat exhaustion or heat stroke you must immediately seek shelter and water.
 - Take frequent short breaks in areas sheltered from direct sunlight; eat and drink small amounts frequently.
 - Try to schedule work for the coolest part of the day, early morning and evening.
- 4.5.2 Prevention of heat-related illnesses:
- Avoid strenuous physical activity outdoors during the hottest part of the day.
 - Wear a hat and light-colored, loose-fitting clothing to reflect the sun.
 - Avoid sudden changes of temperature. Air out a hot vehicle before getting into it.
 - If you take diuretics, ask your doctor about taking a lower dose during hot weather.
 - Drink 8 to 10 glasses of water per day. Drink even more if you are working or exercising in hot weather.
 - Avoid caffeine and alcohol as they increase dehydration.
 - If you exercise strenuously in hot weather, drink more liquid than your thirst seems to require.

4.6 **Personal Protective Equipment**

- Wear a hat and light-colored, loose-fitting clothing to reflect the sun.
- Apply sunscreen to exposed skin (SPF 30 or greater, follow directions on label).
- Wear sunglasses with UV protection.
- Pack extra water to avoid dehydration (try freezing water in bottles overnight to help keep the water cooler for longer during the day).

4.7 **Work-Rest Schedule Practices**

- Intake of fluid will be increased beyond that which satisfies thirst, and it is important to avoid "fluid debt," which will not be made up as long as the individual is sweating.
- Two 8-ounce glasses of water should be taken prior to beginning work, then up to 32 oz. per hour during the work shift; fluid replacement at frequent intervals is most effective.

- The best fluid to drink is water; liquids like coffee or soda do not provide efficient hydration and may increase loss of water.
- If commercial electrolyte drinks (e.g., Gatorade) are used, the drink should be diluted with water, or 8 ounces of water should be taken with each 8 ounces of electrolyte beverage.
- Additional salt is usually not needed and salt tablets should not be taken.
- Replacement fluids should be cool, but not cold.
- Breaks will be taken in a cool, shaded location, and any impermeable clothing should be opened or removed.
- Dry clothing or towels will be available to minimize chills when taking breaks.
- Manual labor will not be performed during breaks, other than paperwork or similar light tasks.
- Other controls that may be used include:
 - Scheduling work at night or during the cooler parts of the day (6 am–10 am, 3 pm–7 pm).
 - Erecting a cover or partition to shade the work area.
 - Wearing cooling devices such as vortex tubes or cooling vests beneath protective garments. If cooling devices are worn, only physiological monitoring will be used to determine work activity.

4.8 **Evaluating the Work-Rest Schedule's Effectiveness**

4.8.1 Once a work-rest schedule is established, the work supervisor must continually evaluate its effectiveness through observation of workers for signs/symptoms of heat stress. Measurement of each worker's vitals (e.g., pulse, blood pressure, and temperature) can provide additional information in determining if the schedule is adequate, and is accomplished as follows:

4.8.2 At the start of the workday each worker's baseline pulse rate (in beats per minute – bpm) is determined by taking a pulse count for 15 seconds and multiplying the result by four or an automated pulse count device may be utilized. Worker pulse rates can then be measured at the beginning and end of each break period to determine if the rest period allows adequate cooling by applying the following criteria:

- Each worker's maximum heart rate at the start of any break should be less than [180 minus worker's age] bpm. If this value is exceeded for any worker, the duration of the following work period will be decreased by at least 10 minutes.
- At the end of each work period all workers' heart rates must have returned to within +10% of the baseline pulse rate. If any worker's pulse rate exceeds this value the break period will be extended for at least 5 minutes, at the end of which pulse rates will be remeasured and the end-of-break criteria again applied.

4.8.3 Use a clinical thermometer or similar device to measure the oral/ear temperature at the beginning (before drinking liquids) and end of each break period and apply the following criteria:

- If the oral temperature exceeds 99.6°F, shorten the next work cycle by one-third without changing the rest period.
- If the oral temperature still exceeds 99.6°F (36.6°C) at the beginning of the next rest period, shorten the following work cycle by one-third.

4.8.4 Use of an automated or similar blood pressure device will be used to assess each employee's blood pressure at the beginning and end of each break period to determine if the rest period allows adequate cooling by applying the following criteria:

- If the blood pressure of an employee is outside of 90/60 to 150/90, then the employee will not be allowed to begin or resume work; extend the break period by at least five minutes, at the end of which blood pressure rates will be remeasured and the end-of-break criteria again applied.

4.8.5 All physiological monitoring of heat stress will be documented using *S3NA-511-FM Heat/Cold Stress Monitoring Log*.

4.9 **Training**

4.9.1 Project staff and their supervisors that may be exposed to the hazard will be oriented to the hazard and the controls prior to work commencing.

4.9.2 Those personnel potentially exposed to heat stress will receive training including, but not limited to

- Sources of heat stress, influence of protective clothing, and importance of acclimatization.

- How the body handles heat.
- Recognition of heat-related illness symptoms.
- Preventative/corrective measures.
 - Employees will be informed of the harmful effects of excessive alcohol consumption in the prevention of heat stress.
 - All employees will be informed of the importance of adequate rest and proper diet in the prevention of heat stress.
- First aid procedures for heat stress-related illnesses.

S3NA-511-FM Heat Stress Monitoring Log

The purpose of this form is to track entry into hot zones wearing chemically protective clothing and monitor employees for heat stress-related illness. It is the responsibility of the foreman or supervisor-in-charge to ensure that each person entering the hot zone completes the required information. Vital signs must be taken by a competent person.

Project Name:			Foreman/Supervisor:				Work/Rest Schedule ¹ : IN (min) OUT (min)									
Date:	Water Provided ²		Acclimated ³		Initial Vitals ³	Vital Signs and Time In/Out ⁴

					BP			BP			BP			BP		
					Temp			Temp			Temp			Temp		

1. Please refer to S3NA-511-PR, Heat Stress. Section 6.3 provides specific details on how to develop a work-rest schedule.

2. Each employee should be provided a sufficient amount of water or sports drink before entering the hot zone. Drinks such as coffee and cola should be discouraged.

3. A worker is "acclimated" if he/she has worked in a hot environment for at least 7 to 10 consecutive days. If a worker is acclimated, check "Yes." If a worker is not acclimated, check "No" and reduce the "Min In" by 50 percent for that employee until the 7- to 10-day period is reached.

4. "Vitals" refers to employee vital signs (e.g., pulse [P], blood pressure [BP], body temperature [Temp], etc.). Initial vitals must be taken and recorded before the start of work operations in the hot zone. Each time the employee exits the hot zone, vitals must be taken and evaluated for heat stress criteria. Section 6.4 of S3NA-511-PR *Heat Stress* provides specific instructions for taking and evaluating employee vital signs.

5. Body temperature vital signs will be recorded in °F.

S3NA-511-WI1 Temperature Thresholds

1.0 Work-Rest Schedule

The prevention of heat stress is best performed through supervisor observation of employees and routine heat stress awareness training activities. However, it is also necessary to implement a work routine that incorporates adequate rest periods to allow workers to remove protective clothing, drink fluids (vital when extreme sweating is occurring), rest and recover. The frequency and length of work breaks must be determined by the work supervisor based upon the ambient temperature, amount of sunshine, humidity, the amount of physical labor being performed, the physical condition of the workers (e.g., acclimated/not), and protective clothing being used.

1.1 Establishing a Work-Rest Schedule

1.1.1 AECOM permits the use of either of two techniques to initially determine an appropriate daily work-rest schedule. These methods are:

- Wet Bulb Globe Thermometer (WBGT) Method: This method is preferred, if a WBGT meter is available.
- Adjusted Temperature Method: This method should be used only if WBGT data is not available.

1.1.2 Either procedure will provide the work supervisor with a recommended routine; however, adjustments to this routine may be required to accommodate the specific daily conditions at the work site.

1.2 WBGT Work-Rest Schedule Guidelines

1.2.1 Table 1, the Non-CPC Activities WBGT Chart, is intended for use where personnel are not utilizing CPC. Where workers are required to utilize CPC, Table 2, the CPC Activities WBGT Chart, will be used.

1.2.2 WBGT readings are compared directly with the values the applicable WBGT Chart for the applicable work rate (where light work corresponds to minimal physical activity besides standing/watching; very heavy work corresponds to significant, continuous physical labor) to determine the work-rest frequency.

Table 1. Non-CPC Activities WBGT Chart

Work-Rest Regimen	WBGT			
	Light Work	Moderate Work	Heavy Work	Very Heavy Work
Continuous Work	85°F (29.4°C)	81°F (27.2°C)	78°F (25.6°C)	
75% Work – 25% Rest	86°F (30°C)	83°F (28.3°C)	81°F (27.2°C)	
50% Work – 50% Rest	88°F (31.1°C)	85°F (29.4°C)	83°F (28.3°C)	81°F (27.2°C)
25% Work – 75% Rest	90°F (32.2°C)	87°F (30.6°C)	86°F (30°C)	85°F (29.4°C)

Modified from ACGIH's 2002 *Threshold Limit Values for Chemical Substances and Physical Agents*, for acclimatized workers

Table 2. CPC Activities WBGT chart

Work-Rest Regimen	WBGT			
	Light Work	Moderate Work	Heavy Work	Very Heavy Work
Continuous Work	74°F (23.3°C)	70°F (21.1°C)	67°F (19.4°C)	
75% Work – 25% Rest	75°F (23.9°C)	72°F (22.2°C)	70°F (21.1°C)	

50% Work – 50% Rest	77°F (25°C)	74°F (23.3°C)	72°F (22.2°C)	70°F (21.1°C)
25% Work – 75% Rest	79°F (26.1°C)	76°F (24.4°C)	75°F (23.9°C)	74°F (23.3°C)

Modified from ACGIH's 2002 *Threshold Limit Values for Chemical Substances and Physical Agents*, for acclimatized workers

1.3 Adjusted Temperature Work-Rest Schedule Guidelines

This method can be utilized where WBGT data is not available, and requires only that the ambient temperature be known. Adjustment factors are applied to the ambient temperature to account for departures from ideal conditions (sunny conditions, light winds, moderate humidity and a fully acclimated work force). The adjustments will be made by addition or subtraction to the ambient temperature reading, or changes in table position, as indicated in Table 3. Adjustments are independent and cumulative, all applicable adjustments should be applied. The result is the Adjusted Temperature, which can be compared with the values in Table 4 for the applicable work rate (where light work corresponds to minimal physical activity besides standing/watching; very heavy work corresponds to significant, continuous physical labor) to determine the work-rest schedule.

Table 3. Temperature Adjustment Factors

Time of Day	
Before daily temperature peak ¹	+2°F (+1.11°C)
10 am – 2 pm (peak sunshine)	+2°F (+1.11°C)
Sunshine	
No clouds	+1°F (+0.56°C)
Partly Cloudy (3/8 – 5/8 cloud cover)	-3°F (-1.67°C)
Mostly Cloudy (5/8 – 7/8 cloud cover)	-5°F (-2.78°C)
Cloudy (>7/8 cloud cover)	-7°F (-3.89°C)
Indoor or nighttime work	-7°F (-3.89°C)
Wind (ignore if indoors or wearing CPC)	
Gusts greater than 5 miles per hour at least once per minute	-1°F (-0.56°C)
Gusts greater than 10 miles per hour at least once per minute	+2°F (+1.11°C)
Sustained greater than 5 miles per hour	-3°F (-1.67°C)
Sustained greater than 10 miles per hour	-5°F (-2.78°C)
Humidity (ignore if wearing CPC)	
Relative Humidity greater than 90%	+5°F (+2.78°C)
Relative Humidity greater than 80%	+2°F (+1.11°C)
Relative Humidity less than 50%	-4°F (-2.23°C)
Chemical Protective Clothing (CPC)	
Modified Level D (coveralls, no respirator)	+5°F (+2.78°C)
Level C (coveralls w/o hood, full-face respirator)	+8°F (+4.45°C)
Level C (coveralls with hood, full-face respirator)	+10°F (+5°C)
Level B with airline system	+9°F (+5.56°C)
Level B with SCBA	+9°F (+5.56°C) and right one column ²
Level A	+14°F (+7.78°C) and right one column ²
Other	Specified in the HASP
Miscellaneous	

¹ This adjustment accounts for temperature rise during the day. If the temperature has already reached its daytime peak it can be ignored.

² Locate the proper column based on work rate, then move one column to the right (next higher work rate) before locating the corresponding adjusted temperature.

Unacclimated work force	+5°F (+2.78°C)
Partially acclimated work force	+2°F (+1.11°C)
Working in shade	-3°F (-1.67°C)
Breaks taken in air conditioned space	-3°F (-1.67°C)

Table 4. Work-Rest Schedule Based on Adjusted Temperature

Work-Rest Regimen	Adjusted Temperature			
	Light Work	Moderate Work	Heavy Work	Very Heavy Work
No specified requirements	< 80°F (22.67°C)	< 75 (23.88°C)	< 70 (21.11°C)	< 65 (18.33°C)
15 minute break every 90 minutes of work	80°F – 90°F (22.67°C) - (32.22°C)	75 – 85 (23.88°C) - (29.44°C)	70 – 80 (21.11°C) - (22.67°C)	65 – 75 (37.77°C) - (23.88°C)
15 minute break every 60 minutes of work	>90 – 100 (32.22°C) - (37.77°C)	> 85 – 95 (23.88°C) - (35°C)	>80 – 85 (22.67°C) - (23.88°C)	>75 – 80 (23.88°C) - (22.67°C)
15 minute break every 45 minutes of work	>100 – 110 (37.77°C) - (43.33°C)	>95 – 100 (35°C) - (37.77°C)	>85 – 90 (23.88°C) - (32.22°C)	>80 – 85 (22.67°C) - (23.88°C)
15 minute break every 30 minutes of work	>110 – 115 (43.33°C) - (46.11°C)	>100 – 105 (37.77°C) – (40.55°C)	>90 – 95 (32.22°C) - (35°C)	>85 – 90 (23.88°C) - (32.22°C)
15 minute break every 15 minutes of work	>115 – 120 (46.11°C) - (48.88°C)	>105 – 110 (40.55°C) - (43.33°C)	>95 -100 (35°C) - (37.77°C)	>90 – 95 (32.22°C) - (35°C)
Stop Work	>120 (48.88°C)	>110 (43.33°C)	>100 (37.77°C)	>95 (35°C)

Note: Time spent performing decontamination or donning/doffing CPC should not be included in calculating work or break time lengths.

S3NA-511-WI2 Symptoms and Treatment

1.0 Heat Stress-related Illness Symptoms

1.1 There are three stages of heat-related illness:

1.1.1 Heat Cramps

- Heat cramps are painful muscle cramps caused by over-exertion in extreme heat.
 - Muscle spasms, and
 - Pain in the hands, feet, and abdomen

1.1.2 Heat Exhaustion

- Heat exhaustion is the next stage. Symptoms include:
 - Cool, moist, pale, flushed or red skin
 - Heavy sweating
 - Headache
 - Nausea or vomiting
 - Dizziness, and
 - Exhaustion.
- Mood changes (irritable, or confused/can't think straight)
- Pale, cool, moist skin
- Heavy sweating
- Dizziness
- Nausea
- Fainting

1.1.3 Heat Stroke

- Heat stroke. Heat exhaustion can sometimes lead to heat stroke, which can be fatal and requires emergency treatment. Heat stroke happens when you stop sweating and your body temperature continues to rise, often to 105° F (40.5° C) or higher. Symptoms of heat stroke:
 - Vomiting
 - Decreased alertness level or complete loss of consciousness
 - High body temperature (sometimes as high as 105° F (40.5° C))
 - Skin may still be moist or the victim may stop sweating and the skin may be red, hot, and dry
 - Rapid, weak pulse, and
 - Rapid, shallow breathing.
- Red, hot, usually dry skin
- Lack of or reduced perspiration
- Nausea
- Dizziness and confusion
- Strong rapid pulse
- Coma

2.0 Recommended Treatment for Heat Stress-related Illnesses

2.1 Heat Cramps

2.1.1 Treatment:

- Gently stretch the cramped muscle and hold the stretch for about 20 seconds, then gently massage the muscle. Repeat these steps if necessary.
- Take more frequent breaks and drink more water.
- Move victim to a cool place.
- Administer drinks of cool water.

- Apply manual pressure to cramped muscles.
- Seek medical attention if symptoms are not alleviated or if more serious problems are indicated.

2.1.2 Heat Exhaustion

- Treatment of heat exhaustion:
 - Get out of the sun to a cool location and drink lots of water, a little at a time.
 - Remove or loosen tight clothing.
 - If you are nauseated or dizzy, lie down.
- Move the victim to a cool place.
- Remove as much clothing as possible and elevate the feet.
- Administer drinks of cool water and fan to cool.
- Seek medical attention immediately.

2.1.3 Heat Stroke

- Treatment of heat stroke, or if a person's temperature exceeds 102° F (38.9 ° C) :
- Call for immediate medical help and then try to lower the temperature as quickly as possible:
 - Apply cool (not cold) water the person's whole body, then fan the person.
 - Stop cooling once the person's temperature appears to be down; be careful not to overcool.
 - Do not give aspirin or acetaminophen to reduce the temperature.
- Treat as a true medical emergency. Seek medical help immediately
- Reduce body temperature quickly
- Douse with cool water (not cold water)
- Wrap in wet sheet
- If available, use cold packs under arms, neck, and ankles
- Protect from injury during convulsion
- Ensure that the person's airway is open.
- Transfer to a medical facility immediately.

S3NA-511-ST Heat Exposure

The following Occupational Health and Safety regulations apply directly to heat stress hazards:

Jurisdiction	Regulation
United States	
OSHA	1910.132
Canada	
Alberta	n/a
British Columbia	OHS Regulation (1997) Sect 7.28 – 7.32, 8.21, 12.72, 12.73
Manitoba	Workplace Health and Safety Regulation (217/2006) Sect 4.12, 4.13
New Brunswick	OHS Regulation (91-191) Sect 44
Newfoundland/Labrador	OHS Regulation (C.N.L.R. 1165/96) Sect 10
Nova Scotia	n/a
NWT/NU Territories	n/a
Ontario	O. Reg. 213/91 Sect 112 O. Reg. 851 Sect 129 Heat Stress (Health and Safety Guidelines) (April 2003)
Prince Edward Island	OHS Regulations (EC180/87) Sect 42.1
Quebec	OHS Regulation (R.R.Q., c. S-2.1, r.19.01 O.C. 885-2001) Sect 121 – 124, Schedule 4, Schedule 5
Saskatchewan	OHS Regulation (R.R.S., c. O-1, r. 1) Sect 70
Yukon Territory	Occupational Health Regulations (O.I.C. 1986/164) Sect 9, 12

S3NA-513-PR Lead

1.0 Purpose and Scope

- 1.1 Control occupational exposures to lead to the lowest level practicable.
- 1.2 This procedure applies to all AECOM North America-based employees and operations.

2.0 Terms and Definitions

- 2.1.1 **Action Level (AL):** An airborne lead concentration of 30 micrograms per cubic meter of air ($30 \mu\text{g}/\text{m}^3$) (or more stringent as per the local regulations), calculated as an 8-hour time weighted average (TWA), irrespective of mitigation provided by any respiratory protection that might be used.
- 2.1.2 **Demolition:** The wrecking or taking out of any load-supporting structural members and any related razing, removing, or stripping of lead products.
- 2.1.3 **HAZWOPER:** Any on-site contamination investigation or clean-up activities subject to the operational requirements of *S3NA-509-PR Hazardous Waste Operations and Emergency Response*.
- 2.1.4 **Lead Containing Material:**
 - Structural or decorative components containing lead in excess of 1% by weight.
 - Paint or other surface coatings that contain lead equal to or in excess of 1.0 milligram per centimeter squared ($1.0 \text{ mg}/\text{cm}^2$) or 0.5% by weight.
 - Bulk materials containing lead in excess of 0.1% or for soils any lead-in-soil concentration in excess of 1,000 mg/kg.
 - "Lead" means metallic lead, all inorganic lead compounds, and organic lead soaps. Excluded from this definition are all other organic lead compounds.
- 2.2 **Permissible Exposure Limit (PEL):** The maximum exposure concentration to which an individual may be exposed to for an 8-hour time weighted average (TWA) without experiencing adverse health effects. For normal work shifts (8 hours or less), the PEL for lead is 50 micrograms per cubic meter of air ($50 \mu\text{g}/\text{m}^3$), or more stringent as per local regulations.
- 2.3 **Renovation:** The modifying of any building component that does not impact structural supports.

3.0 Attachments

- 3.1 None

4.0 Procedure

4.1 SH&E Department Responsibilities

- 4.1.1 Provide technical assistance in the identification of lead-containing materials and the evaluation of lead exposure hazards as requested by management personnel.
- 4.1.2 Review and approve all lead exposure hazard assessments prior to the start of work activities.
- 4.1.3 Review and approve all lead exposure mitigation plans and exposure monitoring activities to ensure compliance with federal, state, and local regulations.
- 4.1.4 Monitor compliance with the various aspects of this procedure and provide technical assistance regarding implementation of the requirements set forth in this procedure.

4.2 **Project Managers' (field task managers, supervisors) Responsibilities**

- 4.2.1 Confirm that the presence of lead-containing materials at AECOM work sites is identified (where reasonably possible) prior to commencing field activities, that prior to initiating any task involving disturbance of or contact with lead-containing materials (or immediately upon identification of previously unknown lead-containing materials) a lead exposure task hazard assessment is developed and approved by the **SH&E Department**, and that the applicable requirements are observed for each task where the lead exposure assessment indicates that the airborne lead concentrations can exceed the Action Level or other significant lead exposure hazards are present.
- 4.2.2 Confirm that employees developing work procedures and/or conducting work activities involving lead-containing materials possess any required state specific registrations or certifications.
- 4.2.3 Confirm that employees assigned to perform any work activities involving lead-containing materials have been trained in the job-specific hazards of lead exposure, have received proper medical surveillance, and are trained and properly fit tested in the use of any designated respiratory protection devices.
- 4.2.4 Provide the training program as initial training prior to the time of job assignment or prior to the start up date for this requirement, whichever comes last.
- 4.2.5 Provide the training program at least annually for each employee who is subject to lead exposure at or above the action level on any day.

4.3 **Employee Responsibilities**

- 4.3.1 Do not disturb or handle any lead-containing materials without appropriate personal protective equipment (PPE), training in the job-specific hazards of lead exposure, medical monitoring, and respirator fit test.
- 4.3.2 Immediately notify the **Project Manager** of the presence or suspected presence of previously unidentified lead containing materials in the workplace, and cease all work activities involving disturbance or contact with the materials until further direction is received.

4.4 **Activity-Specific Requirements**

The following operation-specific requirements pertain to activities where the presence of lead-containing materials is identified, suspected, or recognized as a significant operational occurrence.

4.4.1 **HAZWOPER Activities**

Lead may be present at HAZWOPER sites as a soil or groundwater contaminant or as a building material. If such contamination is noted, the following requirements must be observed:

- The site-specific health and safety plan (HASP) must provide a specific analysis of the lead exposure hazard for each task involving the disturbance or handling of lead-contaminated materials.
- If any potential is identified for worker lead exposures to exceed the AL, then specific lead exposure control and monitoring procedures must be developed for the work activity and included in the HASP.
- If workers may be exposed in excess of the AL, they must complete baseline medical monitoring and lead awareness training.

4.4.2 **Demolition or Renovation Activities**

The past widespread use of lead-containing materials in buildings is widely recognized as the source of a significant exposure hazard for personnel performing demolition and renovation activities. Accordingly, the following requirements will be observed:

- Prior to commencement of demolition or activities, a thorough inspection and sampling program will be completed throughout the demolition area to identify the presence of lead-containing materials.
- Where feasible, lead-containing materials will be removed prior to commencement of general work activities.
- The hazards of any remaining lead will be analyzed and an exposure control and monitoring plan developed to prevent worker lead exposures in excess of the PEL (required) and the AL (where feasible). The exposure control plan must be approved by the SH&E Department prior to implementation.

- Prior to commencing demolition activities the appropriate notifications must be filed with the federal, state, and local regulatory agencies as when necessary. The **Project Manager** is required to determine the appropriate reporting requirements.
- If workers may be exposed in excess of the AL, they must complete baseline medical monitoring and lead awareness training.
- Disposal of lead containing materials must meet federal, provincial, territorial, state, and local regulatory requirements. The project manager is required to address this in the project work plan.

4.4.3 Other Activities

If the presence of lead-containing material is identified or suspected at any work location, and there is the potential for this material to become disturbed during planned work activities, then the following requirements must be observed:

- A lead exposure hazard assessment will be completed for each task in which lead-containing material may be disturbed.
- If any exposure assessment indicates the potential for worker exposures to exceed the AL, then appropriate exposure mitigation procedures must be identified to keep exposures to less than the PEL (required) and the AL (where feasible). Mitigation procedures must be reviewed and approved by the **SH&E Manager** prior to implementation.
- If workers may be exposed in excess of the AL, they must complete baseline medical monitoring and lead awareness training.
- The **SH&E Department** will determine if any exposure-monitoring procedures must be implemented during work activities.

4.5 Worker Exposure Control Program

The following requirements pertain to all workers performing tasks where the associated lead exposure assessment indicates the potential for lead exposures to exceed the AL.

4.5.1 Medical Monitoring Requirements

- Prior to commencing work where lead exposure may exceed the AL, each employee will have completed a biological monitoring procedure for blood lead and ZPP (Zinc Protoporphyrin) concentrations. This testing may include baseline and exit collections. The specific requirements will be defined by AECOM's Corporate Medical Provider and SH&E Manager prior to project initiation. Workers must have a medical clearance from AECOM's Corporate Medical Provider prior to performing work involving potential lead exposures at or above the AL.

4.5.2 Medical Removal

- AECOM will temporarily remove an employee from work where there is excess exposure to lead as determined by a physician's written medical opinion that the employee should be removed from such exposure. The physician's determination may be based on biological monitoring results, the employee's inability to wear a respirator, evidence of illness, other signs or symptoms of lead-related dysfunction or disease or any other reason deemed medically sufficient by the physician.

4.5.3 Training

Each worker who may be exposed shall complete training consisting of the following elements:

- Lead exposure limits and other regulatory requirements.
- Job-specific lead hazards and exposure prevention measures.
- The health hazards associated with lead exposure.
- The quantity, location, manner of use, release, and storage of lead in the workplace and the specific nature of operations that could result in exposure to lead, especially exposures above the PEL.
- The project-specific engineering controls and work practices associated with the employee's job assignment.
- The measures employees can take to protect themselves from exposure to lead, including modification of such habits as smoking and personal hygiene, and specific procedures that AECOM has implemented to protect employees from exposure to lead such as appropriate work practices, emergency procedures, and the provision of personal protective equipment.
- The purpose, proper selection, fitting, proper use, and limitations of respirators and protective clothing.

- The purpose and a description of the medical surveillance program.
- The employee's rights of access to records, as per *S3NA-604-PR Medical Records*.

4.5.4 Respiratory Protection

Where respiratory protection is specified for use in controlling worker exposures to lead each employee must:

- Be medically qualified for use of the specified respiratory protection.
- Complete respirator training and fit testing.
- Be assigned an appropriate respirator for use during field operations.

4.5.5 Personal Protective Equipment

In any operation where workers may experience airborne lead concentrations above the AL, or where the possibility of skin or eye irritation exists, employees shall be provided with the following:

- Disposable coveralls or similar full-body work clothing
- Gloves, hoods, and boots or disposable shoe coverlets
- Face shields, goggles, or other appropriate protective equipment necessary for safe job performance
- Clean change rooms equipped with separate storage facilities that will prevent cross contamination from protective work clothing and equipment to street clothes
- All protective clothing shall be cleaned, laundered, properly disposed of, and repaired or replaced as necessary. AECOM will provide all necessary PPE that is incidental to the work at no cost to the employee.

4.5.6 Air Monitoring

- Operations involving the potential airborne exposure to lead shall be required to conduct initial and ongoing personal air sampling to represent employee exposure

4.6 Safe Work Practices

4.6.1 Regulated Areas

- Access to lead-contaminated work areas shall be regulated and limited to authorized persons. A daily roster of all persons entering such areas shall be kept. AECOM employees shall not enter or remain in regulated areas when any of the safety systems such as ventilation or containment is not functional.
- In each work area, where the AL is exceeded, the following warning sign shall be posted:

**WARNING
LEAD WORK AREA
POISON
NO SMOKING OR EATING**

4.6.2 General Work Practices

- Contaminated protective equipment such as respirators, airline hoses, etc., shall not be removed from the regulated area until it has been cleaned.
- Employees shall not be permitted to exit the regulated area until contaminated equipment and clothing have been removed in accordance with the preceding bullets and employees have showered and washed their hands and face with soap and water.
- Removal of lead from protective clothing or equipment by blowing, shaking, or any other means which could disperse lead into the air is prohibited.
- No food or beverages shall be present or consumed in the regulated area.
- No tobacco products shall be present or used and cosmetics shall not be applied in the regulated area.
- All employees shall be required to shower at the end of each work shift.
- During the operation, all employees shall be required to wash their hands and face prior to eating, drinking, smoking, or applying cosmetics.
- Whenever possible, wet methods shall be used when handling or processing lead compounds. Water spray, fogging, or water collection systems, etc., shall be used (e.g., lead contaminated soil shall be thoroughly wetted for excavation operations).

- Dry sweeping of lead or lead-contaminated materials is prohibited. When wet methods cannot be used, HEPA filter vacuum cleaners shall be required.
- Containers of contaminated protective clothing and equipment are to be labeled as follows:
CAUTION: CLOTHING CONTAMINATED WITH LEAD. DO NOT REMOVE DUST BY BLOWING OR SHAKING. DISPOSE OF LEAD CONTAMINATED WASH WATER IN ACCORDANCE WITH APPLICABLE LOCAL, STATE OR FEDERAL REGULATIONS

5.0 Records

- 5.1 The employer shall establish and maintain an accurate record of all monitoring as per *S3NA-602-PR Exposure Monitoring*.
- 5.2 The employer shall maintain or assure that the physician maintains those medical records for at least 40 years, or for the duration of employment plus 20 years, whichever is longer.

S3NA-518-PR Radiation Gauge Source Program

1.0 Purpose and Scope

- 1.1 Portable gauges are used in various AECOM business lines involved in agriculture, construction, and civil engineering to measure things like the moisture or compaction in soil, and the density of asphalt in paving mix.
- 1.2 While gauge source license requirements vary based upon Regulatory Agencies, radioactive material sources, project location (i.e. Federal property, Agreement State, etc.), and length of project, this procedure provided AECOM with a standard approach to managing Gauge Source Programs.
- 1.3 This procedure provides a set of guidelines for all AECOM Authorized Operators of portable gauging devices that contain radioactive sealed sources (i.e., byproduct and/or accelerator produced material).
- 1.4 The procedure establishes requirements for AECOM gauge source license holders to provide information on their program, inventory, license, etc. to AECOM's Corporate Radiation Safety Officer (Corporate RSO).
- 1.5 This procedure applies to all AECOM North America based employees and operations.

2.0 Terms and Definitions

- 2.1 **Accelerator Produced Material:** Material that has been bombarded with energetic particles (accelerated) to create energies that are suitable for certain technological and medical applications
- 2.2 **Agreement State:** A State that has entered into an agreement with the Nuclear Regulatory Commission (NRC) which gives the State the authority to license radioactive materials used, possessed, and stored within its State borders and jurisdiction.
- 2.3 **ALARA:** As Low As Reasonably Achievable. Acronym for methods used to minimize exposure to radioactive materials through time, distance and shielding.
- 2.4 **Authorized Operators:** Employee who has successfully completed a gauge manufacturer's training course and has been trained in the specific provisions of this standard operating procedure (SOP) and the requirements of AECOM's respective Radioactive Materials License.
- 2.5 **Byproduct Material:** Any radioactive material yielded in or made radioactive by exposure to the radiation incident to the process of producing or utilizing special nuclear materials.
- 2.6 **Corporate Radiation Safety Officer (RSO):** AECOM employee responsible for AECOM's North American Corporate Radiation Safety Program (S3NA-516-PR).
- 2.7 **Leak Test:** A physical process in which a sample is collected on the outside of the gauge's sealed source(s) shielding to determine the presence of radioactive leakage.
- 2.8 **Licene Radiation Safety Officer (RSO):** AECOM employee named as RSO on an AECOM radioactive materials license. This employee is responsible for developing, maintaining, auditing, implementing, and amending an appropriate Radiation protection Plan in accordance with AECOM's Corporate Radiation Safety Program and license conditions.
- 2.9 **Portable Gauges:** Various instruments manually used in the measurement of material properties. Typical portable gauges owned, leased, and operated by AECOM include (but not limited to): nuclear density and/or moisture gauges, XRF Spectrum Analyzers, and Electron Capture Detectors.
- 2.10 **Project Manager:** Employee responsible for the management of the project activities, including but not limited to health and safety as well as the technical and financial performance of the project.
- 2.11 **Radioactive Material (RAM) License:** License issued by a regulating agency for the possession, use and/or storage of portable gauging and measurement equipment that contains radioactive sealed sources.

- 2.12 **Radioactive Sealed Source:** Any radioactive material that is encased in a capsule designed to prevent leakage or escape of the radioactive material that is created from either byproduct and/or accelerator-produced material.
- 2.13 **Reciprocity:** The act of one regulatory agency honoring the license of another regulatory agency.
- 2.14 **Regulatory Agency:** A government body with designated authority for radioactive material within designated boundaries. Regulatory Agencies for portable gauging and measuring equipment include the NRC, the US Department of Energy, Agreement States, and military bases.
- 2.15 **Thermo luminescent Dosimeter (TLD):** A type of dosimeter for measuring the external exposure to gamma, X-ray, and β radiation. Energy absorbed from the radiation is stored and emitted at the time of analysis as light. The amount of light emitted is proportional to the energy absorbed and hence to the dose received by the individual wearing the TLD.
- 2.16 **Transport Index (TI):** The maximum radiation level in millirem/hour at a distance of one meter from all external surfaces of the prepared portable gauge package for shipping and/or transport. It is a dimensionless number placed on the label of a package to designate the degree of control to be exercised during shipment or transportation.

3.0 Attachments

4.0 Procedure

4.1 Roles and Responsibilities

4.1.1 Corporate RSO is responsible for:

- Maintaining and ensuring compliance with AECOM's Corporate Radiation Safety Program (S3NA-516-PR Radiation Safety Program).
- Maintaining and ensuring compliance with AECOM's Radiation Gauge Source Program by providing a single point of contact and repository for information on all AECOM gauge source licenses and programs.
- Reviewing this procedure on an annual basis and revising it as necessary based on the results of the annual review.
- Approving all RAM license RSOs, including RSOs named on specific and general gauge source licenses.

4.1.2 License RSO

Each **License RSO** is responsible for ensuring that the conditions of AECOM's RAM License and the requirements of this SOP are successfully met. Specifically, the **License RSO** is responsible for:

- Providing copies of all licenses and compliance documents (audits, inventories, leak tests, training records, amendments, procedures, dose reports, etc.) to the **Corporate RSO**.
- Preparing and maintain the License Radiation Protection Plan (RPP).
- Completing compliance reports (annual or other) as required by regulatory authorities.
- Stopping unsafe licensed activities.
- Amending RAM Licenses to reflect current regulatory requirements, industry standards and procedures, and AECOM health and safety requirements.
- Obtain necessary reciprocity licensing for work in areas regulated by other Regulatory Agencies.
- Ensuring that all users of portable gauges containing sealed sources have been authorized to operate such equipment.
- Ensuring initial and refresher training is provided for **Authorized Operators**.
- Ensuring that all records are properly filed and maintained.
- Conducting annual program audits.
- Reviewing the license Radiation Protection Plan on an annual basis and revising it as necessary based on the results of the annual review.
- Notifying Regulating Agency and **AECOM Corporate RSO** if a gauge is lost, stolen, stuck or damaged.

- Notifying either the US Department of Transportation (USDOT) or the CNSC if a transportation accident involving a gauge occurs.

4.1.3 **Authorized Operator**

- Conducting their work in accordance with the procedures established by this procedure, the License RPP, and the conditions and operating procedures of specific RAM License.
- Implementing and following all site specific health and safety requirements.
- Coordinate all shipping/transportation of portable gauges to and from project site.

4.1.4 **Project Manager (field task manager, supervisor)**

- Contact the **License RSO** prior to portable gauge usage at a project site to insure all licensing requirements are complete prior to receipt of the portable gauge at the facility, authorized operators have been selected, and if requirements for dosimetry and radiation surveys are needed/met.
- Ensure gauge users are **Authorized Operators** and have current certifications and training.
- Contact the **License RSO** prior to the anticipated end of the portable gauge use to insure proper regulatory tracking and notification.
- Contact the **License RSO** regularly with portable gauge usage for proper and timely billing of equipment to project.

4.2 **Radiation Protection Plan**

All RAM Licenses shall have an associated RPP that is prepared and approved in accordance with the AECOM Corporate Radiation Safety Program. The RPP shall describe in detail the subjects described in Sections 4.2.1 through 4.2.9.

4.2.1 **ALARA Policy Statement**

It is AECOM's policy to plan and conduct its radiological activities safely and in such a fashion as to protect the health and safety of its employees, subcontractors, members of the public, and the environment. To achieve this, AECOM shall ensure that efforts are taken to reduce radiological exposures and releases to the environment as low as is reasonably achievable, taking into account social, technical, economic, practical and public policy considerations. AECOM is committed to implementing a radiological control program that reflects this policy.

4.2.2 **Personnel Monitoring**

The RPP will define the method for tracking dose to **Authorized Operators**. Typically, and often required by a license, all **Authorized Operators** will wear a personnel monitoring device, such as a thermoluminescent dosimeter (TLD) badge, to measure radiation exposure when using or transporting gauges. The badges shall be exchanged at intervals not to exceed 3 months. The **License RSO** who authorizes a person to operate a gauge containing a radioactive source shall provide the **Authorized Operator** with a dosimeter that:

- Has been issued by a licensed dosimetry service [in the US, National Voluntary Laboratory Accreditation Program (NVLAP) accreditation is required];
- Has not been used by another person since its last reading;
- Is of a type suitable for recording any dose of radiation that the person is likely to receive as a result of the operation of the exposure device; and
- Is designed so that it can be worn on the trunk of the body.

Upon receipt of the results of the analysis by the dosimetry service, the **License RSO** shall review the results for conformance to license and exposure requirements. A copy of the dosimetry service's report will be maintained in the RAM License file and a copy shall be forward to the **Corporate RSO**. At any time, at the request of the employee, the **License RSO** will provide copies of any and/or all personnel radiation dosimetry records for that employee.

Alternate methods for tracking dose must be defined in the RPP and approved by the **Corporate RSO**.

4.2.3 **Radiation Detection Instruments**

AECOM will maintain radiation survey meters for use in the event on an incident involving a gauge. The survey meters will be calibrated annually and checked for functionality before use (e.g., with the

gauge source or a check source). The **License RSO** will provide **Authorized Operators** with a radiation survey meter that:

- Is capable of measuring a dose rate of gamma radiation from the sealed source of between 2 mrem/hr (20 μ Sv/hr) and 10 rem/hr (100 mSv/hr), and
- Indicates that the power level of its batteries is sufficient for its operation.

4.2.4 Sealed Source Leak Testing

- Leak testing (i.e., a check for removable radioactive contamination) will be performed to determine whether there is any radioactive leakage from the source(s) in the gauge. Leak tests shall be collected on all AECOM-owned and leased portable gauges.
- Leak tests will be collected by the **License RSO** or an **Authorized Operator** using an approved kit, such as Troxler Leak Test Kit 3880, in accordance with the kit supplier's instructions. Leak tests will be analysed by an organization authorized by the applicable regulatory agency (NRC, CNSC, or Agreement State).
- Leak tests shall be collected at frequencies in accordance with license requirements.
- Leak test results will be maintained for a period of three (3) years or in accordance with license requirements.

4.2.5 Material Receipt and Accountability

- All **AECOM License RSOs** will complete an inventory of all sealed sources and portable gauges corresponding with the specific RAM Licenses at a minimum once every six months.
- Radioactive materials must be tracked from "cradle to grave." **AECOM License RSOs** shall maintain records of receipt, transfer, and disposal of gauges for a period of three (3) years. Source inventories must also be performed at intervals not to exceed six months. Inventory records will include the following information:
 - Radionuclide and amount of material in each sealed source.
 - Manufacturer, model number and serial number of each device containing radioactive material.
 - Date inventory was performed.
- Inventory records will be maintained by the **License RSO** with other program documents for three (3) years.

4.2.6 Public Dose

- **AECOM License RSOs** and **Authorized Operators** must ensure that following:
 - Gauges are used, transported, and stored in such a way that no member of the public receives a dose of more than 100 mrem (1 mSv) in one year;
 - The dose in unrestricted areas does not exceed 2 mrem (20 μ Sv) in any one hour; and
 - Gauges that are not in storage are controlled and secured from unauthorized use or removal.
- Members of the public include persons who live, work, or may be near locations where gauges are used or stored. This may include AECOM employees or subcontractors whose assigned duties do not include use of gauges, but work in the vicinity where gauges are used or stored.
- In general, gauges should be stored as far away as possible from areas occupied by members of the public. **AECOM License RSOs** must ensure that radiation levels in areas adjacent to gauge storage locations will not exceed the dose limits provided above.
- **License RSOs** should demonstrate in the RPP how compliance the public dose limits will be determined (e.g., provide public dose calculation worksheet).

4.2.7 Maintenance

- AECOM is not licensed to perform any maintenance or cleaning on any portable gauge containing a sealed source unless the source is safely shielded within the gauge. Any maintenance or cleaning will always be performed with the radioactive source in the safe shielded position in accordance with the manufacturer's directions or recommendations.
- **License RSOs** will implement and maintain procedures for routine maintenance (cleaning and lubrication) of licensed gauges according to the manufacturer's recommendations and instructions. The **License RSO** will send gauges to the manufacturer to perform non-routine maintenance or repair operations that require removal of the source or source rod from the gauge.

4.2.8 Transportation

- **License RSOs** shall incorporate appropriate transportation procedures into the license RPP and operating procedures. These procedures must ensure that gauges are transported in compliance with US DOT or CNSC regulations.

4.2.9 Audit Program

- AECOM will verify, on an annual basis, that our activities are being conducted in accordance with the conditions of our RAM Materials License. The **RAM License RSO**, another **RAM License RSO**, or an independent third party may conduct the audit. The audit will include a review of records to ensure that AECOM has properly documented our activities and that this documentation can adequately demonstrate regulatory compliance. Verify with license requirements if annual audit must be completed by an independent party. Copies of completed audits to maintained in the license files.

4.3 Operational Procedures

To limit radiation dose to **Authorized Operators** and the public, each **License RSO** must ensure that an operating procedure(s) is implemented and maintained. A copy of the operating procedure(s) should be distributed to gauge users before initial use of equipment and maintained at the job site. Operating procedures should include the following requirements:

4.3.1 Dosimeters

- Always wear assigned personnel dosimetry device (e.g., TLD) when using or transporting the gauge.
- Never wear another person's dosimeter.
- Never store a dosimeter near the gauge or other radiation source.

4.3.2 Storage

- Before removing the gauge from its place of storage, ensure that in gauges with movable source rods, the rod is locked in the shielded position, and the transport case is locked.
- Sign out the gauge in a logbook, stating the date(s) of use, name(s) of **Authorized Operator(s)** who will be responsible for the gauge, and the temporary job site(s) where the gauge will be used.
- When the gauge is not in use at a temporary job site, place the gauge in a second storage location (e.g., locked in a trunk of a car or locked in a storage shed).
- After making changes affecting the gauge storage area (e.g., changing the location of the gauges within the area, removing shielding, adding gauges, changing the occupancy of adjacent areas, moving the storage area to a new location), reevaluate compliance with public dose limits and ensure proper security of gauges.
- All required signage including Notice of Employee postings, Caution Radiation postings and specific RAM License postings shall be properly located and maintained. Remove all postings when the gauge is removed from the facility.

4.3.3 Transportation

- Prior to transporting the gauge, ensure that each gauge source is in the fully shielded position. Ensure that the source rod is locked in the shielded position and that the gauge is placed into the case and lock the case.
- Block and brace the gauge to prevent movement during transportation and lock the gauge in or to the vehicle. Follow all regulatory requirements regarding transportation.
- Lock the case in or to the vehicle.

4.3.4 Use and Maintenance

- Use the gauge according to the manufacturer's instructions and recommendations.
- Keep gauges away from heavy equipment that could inadvertently run over the unit and potentially expose the source.
- Do not touch the end of the source rod with your fingers, hands, or any part of your body or place any part of the body in the radiation field of the unshielded source.
- If gauges are used for measurements with the unshielded source extended more than 3 feet (1 meter) below the ground surface, use piping, tubing or other casing material to line the hole from the lowest depth to 12 inches (0.3 meters) above the surface. If the piping, tubing, or other casing material cannot extend 12 inches (0.3 meters) above the surface, cap the hole liner or take other

steps to ensure that the hole is free of debris (and it is unlikely that debris will enter the cased hole), so that the unshielded source can move freely (e.g., use a dummy probe to verify that the hole is free of obstructions).

- Unless absolutely necessary, do not look under the gauge when the source rod is being lowered into the ground. If you must look under the gauge to align the source rod with the hole, keep all body parts as far from the unshielded source as possible to minimize radiation exposure.
- After completing each measurement in which the source is unshielded, immediately return the source to the shielded position.
- Return the gauge to its proper storage location at the end of the work shift.
- Log the gauge into the daily use log when it is returned to storage. Perform routine cleaning and maintenance according to the manufacturer's instructions and recommendations.

4.3.5 Security

- Always maintain constant surveillance and immediate control of the gauge when it is not in storage or secured in the transport vehicle.
- Never leave an unsecured gauge unattended.
- Always keep unauthorized persons away from the area when the gauge is being used.

4.4 Emergency Procedures

Lost or stolen gauges and gauges damaged by heavy equipment used at the job site are the most common emergencies that present a potential radiation safety risk. Other emergencies include the failure of the source in the neutron probe to return to the shielded position as a result of being damaged or stuck below the ground surface.

To limit radiation dose to **Authorized Operators** and the public, each **License RSO** must ensure that an emergency procedure(s) is implemented and maintained. A copy of the emergency procedure(s) should be distributed to gauge users before initial use of equipment and maintained at the job site. Emergency procedures should include the following requirements:

4.4.1 Lost or Stolen Gauge

- The **Authorized Operator** must notify the **License RSO** as soon as it is determined that a gauge is missing.
- The **License RSO** will immediately notify the rental firm, if applicable, and contact appropriate Regulatory Agency to notify them of the missing or stolen gauge.
- The **License RSO** will notify the **AECOM Corporate RSO** and follow all AECOM incident reporting procedures.
- The **Authorized Operator** and the **License RSO** will discuss the reasons for the theft/loss and make the necessary changes in the gauge storage area and/or gauge transportation procedures.

4.4.2 Damaged Gauge

- Refer to the RAM License specific operating procedures for guidance on gauge damage procedures for specific portable gauges.
- Immediately secure the area and keep people at least 15 feet (5 meters) from the gauge until the situation is assessed and radiation levels are known. However, perform first aid for injured individuals and remove them from the area only when medically safe to do so.
- If any heavy equipment is involved, detain the equipment and operator until it is determined there is no contamination present.
- Gauge users and other potentially contaminated individuals should not leave the scene until emergency assistance arrives.
- Visually inspect the gauge to determine the position of the source rod (exposed or shielded), and the position of the source shutter (open or closed), and the extent of damage, if any, to the source housing and/or shield.
- In all cases, immediately contact the **License RSO** and the **License RSO** will contact the Regulatory Agency and make reports within the required reporting timeframe.
- The **License RSO** will notify the **AECOM Corporate RSO** and follow all AECOM incident reporting procedures.
- The **License RSO** must arrange for a radiation survey to be conducted as soon as possible.

- Before shipping a damaged gauge, contact the **AECOM Corporate RSO** and the gauge recipient for special requirements.

4.4.3 Stuck Source

- Use the gauge manufacturer's recommended procedures for retrieving a stuck source. When it becomes apparent that efforts to recover the source will be unsuccessful, the **License RSO** will contact the Regulatory Agency.
- The **License RSO** will notify the **AECOM Corporate RSO** and follow all AECOM incident reporting procedures.

4.5 Employee Training and Qualification

Only those AECOM employees, or subconsultants, who have been authorized by a **License RSO** to operate portable gauges, will be permitted to operate gauges at jobsites on behalf of AECOM. The **License RSO** must keep records of all employee training.

The **License RSO** shall have either documented gauge safety training as outlined below or documented RSO training.

4.5.1 Initial Training

- Employees who wish to operate a portable gauging device must successfully complete the following instruction before operating the device:
 - A gauge manufacturer's training course (that meets the criteria in the section entitled "Training for Individuals Working In or Frequenting Restricted Areas" in Draft NUREG-1556, Vol 1, dated September 1996) for the specific gauge to be operated.
 - Instruction by the **AECOM License RSO** on the contents of this standard operating procedure
 - Completion of HAZMAT DOT shipping training for portable gauges (US operators)
- If employees have received initial training in an alternative course or previously through another employer, the **RSO** may still require the employee to participate in the gauge manufacturer's training course.

4.5.2 Annual Refresher Training

- The **License RSO** will conduct, on an annual basis, a refresher training course for all authorized operators of portable gauges containing sealed sources. The refresher course will include the following topics:
 - Changes in CNSC, NRC, or state regulations.
 - Changes in AECOM's license or license conditions.
 - Review of the contents of this standard operating and emergency procedure including a "dry run" of AECOM's emergency procedures.
 - Review of deficiencies identified during annual audit of the license's radiation safety program (as it relates to the use of portable gauges).
 - Review requirements for the transport of sealed sources in portable gauges.

4.5.3 Radiation Awareness Training

- AECOM personnel in offices or other locations where gauge sources are stored shall receive Radiation Awareness (RA) training in accordance with the AECOM Corporate Radiation Safety Program (S3NA-516-PR) and applicable license and RPP requirements. RA training will cover, at a minimum, the hazards associated with the stored radiation sources, recognition of radiation warning signs, location of stored sources, and emergency procedures.

4.6 Gauge Disposal and Transfer

- All portable gauges assigned for disposal or transfer must be transferred to regulatory licensed entity approved for the possession, storage, and disposal for the given source types. Gauges containing licensed radioactive material and shall not be disposed in the trash. Contact the **License RSO** to properly dispose of a portable gauge that contains a radioactive source. Update all inventory records following gauge disposal or transfer.

5.0 Records

- 5.1 AECOM understands that our records are evidence of our efforts to maintain compliance with the conditions of the respective RAM Licenses and applicable regulations. As such, the License RSO will be responsible for maintaining the following records. Records shall be maintained in a manner that is conducive to being audited by the licensing authority or the AECOM Corporate RSO. Copies of records should be provided to the Corporate RSO.
- 5.1.1 Employee's initial and refresher training records will be maintained for a period of no less than 3 years after the individual terminates employment with AECOM.
- 5.1.2 Equipment inventory records will be maintained for at least 3 years from the date of the inventory.
- 5.1.3 Annual audit reports will be maintained for 3 years.
- 5.1.4 Leak test reports will be maintained for 3 years.
- 5.1.5 Calibration records for each radiation survey meter used at job sites, if necessary, will be maintained for 3 years.
- 5.1.6 Personnel monitoring results.
- 5.1.7 Radiation screening records, if generated, will be maintained for 3 years.

S3NA-519-PR Respiratory Protection Program

1.0 Purpose and Scope

- 1.1 This procedure establishes methods that AECOM will use to prevent employee exposure to hazardous concentrations of airborne contaminants or to supply breathing-quality air to employees working in oxygen-deficient atmospheres.
- 1.2 This procedure applies to all AECOM North America-based employees and operations.

2.0 Terms and Definitions

- 2.1 **Air-purifying respirator:** A respirator with an air-purifying filter, cartridge, or canister that removes specific air contaminants by passing ambient air through the air-purifying element.
- 2.2 **Approved:** Equipment tested and listed by the Bureau of Mines, jointly by the Mining Enforcement and Safety Administration (MESA), and the National Institute for Occupational Safety and Health (NIOSH), or jointly by the Mine Safety and Health Administration (MSHA) and NIOSH.
- 2.3 **Assigned protection factor (APF):** The ratio of the ambient concentration of an airborne substance (outside the respirator) to the concentration of the substance inside the respirator. NIOSH defines this as 10 for an approved half-face respirator and 50 for an approved full-face respirator.
- 2.4 **Atmosphere-supplying respirator:** A respirator that supplies the respirator user with breathing air from a source independent of the ambient atmosphere and includes supplied-air respirators (SARs) and self-contained breathing apparatus (SCBA) units.
- 2.5 **Breakthrough:** The first perception of an odor, taste or irritation experienced while wearing an air-purifying respirator. Breakthrough is generally an indication that the cartridges are saturated and are no longer filtering out the contaminant. Breakthrough can also be an indication of an improperly functioning respirator.
- 2.6 **Confined space:** An enclosure, such as a storage tank, process vessel, boiler, silo, tank car, pipeline, tube, duct, sewer, underground utility vault, tunnel, or pit, that has limited means of egress and poor natural ventilation and that may contain hazardous contaminants or be oxygen deficient.
- 2.7 **Canister or cartridge:** A container that has a filter, sorbent, or catalyst, or a combination of these items and that removes specific contaminants from the air passed through the container.
- 2.8 **Demand respirator:** An atmosphere-supplying respirator that admits breathing air to the facepiece only when a negative pressure is created inside the facepiece by inhalation.
- 2.9 **Emergency situation:** Any occurrence such as, but not limited to, equipment failure, rupture of containers, or failure of control equipment that may or does result in an uncontrolled significant release of an airborne contaminant.
- 2.10 **Employee exposure:** Exposure to a concentration of an airborne contaminant that would occur if the employee were not using respiratory protection.
- 2.11 **End-of-service-life indicator (ESLI):** A system that warns the respirator user of the approach of the end of adequate respiratory protection, for example, that the sorbent is approaching saturation or is no longer effective.
- 2.12 **Escape-only respirator:** A respirator intended to be used only for emergency exit.
- 2.13 **Filter or air purifying element:** A component used in respirators to remove solid or liquid aerosols from the inspired air.
- 2.14 **Filtering facepiece (dust mask):** A negative pressure particulate respirator with a filter as an integral part of the facepiece or with the entire facepiece composed of the filtering medium.
- 2.15 **Fit factor:** A quantitative estimate of the fit of a particular respirator to a specific individual, typically estimating the ratio of the concentration of a substance in ambient air to its concentration inside the respirator when worn.

- 2.16 **Fit test:** The use of a protocol to qualitatively or quantitatively evaluate the fit of a respirator on an individual. (See also Qualitative fit test QLFT and Quantitative fit test QNFT.)
- 2.17 **Helmet:** A rigid respiratory inlet covering that also provides head protection against impact and penetration.
- 2.18 **HASP:** Health and Safety Plan
- 2.19 **Hazardous atmosphere:** Any atmosphere, either immediately or not immediately dangerous to life or health, that is oxygen-deficient or that contains a toxic or disease-producing contaminant exceeding the legally established permissible exposure limit (PEL) or, where applicable, the Threshold Limit Value (TLV) established by the American Conference of Governmental Industrial Hygienists (ACGIH).
- 2.20 **High efficiency particulate air (HEPA) filter:** A filter that is at least 99.97% efficient in removing monodisperse particles of 0.3 micrometers in diameter. The equivalent NIOSH 42 CFR 84 particulate filters are the N100, R100, and P100 filters.
- 2.21 **Hood:** A respiratory inlet covering that completely covers the head and neck and may also cover portions of the shoulders and torso.
- 2.22 **Immediately dangerous to life or health (IDLH):** An atmosphere that poses an immediate threat to life, would cause irreversible adverse health effects, or would impair an individual's ability to escape from a dangerous atmosphere.
- 2.23 **Loose-fitting facepiece:** A respiratory inlet covering that is designed to form a partial seal with the face.
- 2.24 **Maximum use concentration (MUC):** The protection factor (PF) of an approved respirator assembly times the permissible exposure limit (PEL). $MUC = PF \times PEL$
- 2.25 **Negative pressure respirator (tight fitting):** A respirator in which the air pressure inside the facepiece is negative during inhalation with respect to the ambient air pressure outside the respirator.
- 2.26 **Oxygen deficient atmosphere:** An atmosphere with oxygen content below 19.5% by volume.
- 2.27 **Powered air-purifying respirator (PAPR):** A respirator that contains a blower that passes ambient air through an air-purifying component. Air-purifying respirators may be half-face (covering the nose and mouth) or full-face (covering the eyes, nose, and mouth).
- 2.28 **Physician or other licensed health care professional (PLHCP):** An individual whose legally permitted scope of practice (i.e., license, registration, or certification) allows him or her to independently provide or be delegated the responsibility to provide some or all of the health care services required by paragraph (e) of this section.
- 2.29 **Positive pressure respirator:** A respirator in which the pressure inside the respiratory inlet covering exceeds the ambient air pressure outside the respirator.
- 2.30 **Powered air-purifying respirator (PAPR):** An air-purifying respirator that uses a blower to force the ambient air through air-purifying elements to the inlet covering.
- 2.31 **Program administrator:** The individual that has the responsibility to verify full compliance with this SOP and determines the need for medical evaluations or any other additional medical attention in regards to the use of a respirator.
- 2.32 **Pressure demand respirator:** A positive pressure atmosphere-supplying respirator that admits breathing air to the facepiece when the positive pressure is reduced inside the facepiece by inhalation.
- 2.33 **Qualitative fit test (QLFT):** A pass/fail fit test to assess the adequacy of respirator fit that relies on the individual's response to the test agent.
- 2.34 **Quantitative fit test (QNFT):** An assessment of the adequacy of respirator fit by numerically measuring the amount of leakage into the respirator.
- 2.35 **Respiratory inlet covering:** That portion of a respirator that forms the protective barrier between the user's respiratory tract and an air-purifying device or breathing air source, or both. It may be a facepiece, helmet, hood, suit, or a mouthpiece respirator with nose clamp.
- 2.36 **Self-contained breathing apparatus (SCBA):** An atmosphere-supplying respirator for which the breathing air source is designed to be carried by the user.

- 2.37 **Service life:** The period of time that a respirator, filter or sorbent, or other respiratory equipment provides adequate protection to the wearer.
- 2.38 **Supplied-air respirator (SAR) or airline respirator:** An atmosphere-supplying respirator for which the source of breathing air is not designed to be carried by the user.
- 2.39 **Tight-fitting facepiece:** A respiratory inlet covering that forms a complete seal with the face.
- 2.40 **User seal check:** An action conducted by the respirator user to determine if the respirator is properly sealed to the face.

4.0 Procedure

4.1 Roles and Responsibilities

- 4.1.1 **Program Administrator.** The AECOM Americas **SH&E Director** is the Respiratory Protection Program Administrator. The **Program Administrator** shall:
- Verify full compliance with this SOP.
 - Determine the need for medical evaluations or any other additional medical attention related to the use of a respirator.
 - Perform the program evaluations described in this SOP.
- 4.1.2 **District/office manager and project manager (including Operations Field Manager, supervisors, etc)** shall:
- Verify compliance with the respiratory protection program set forth in this procedure.
 - Verify that only those employees who are medically qualified, properly trained, and fit tested are assigned to respirator work.
 - Verify that respirators are provided, repaired, or replaced as may be required due to wear and deterioration.
- 4.1.3 **Region SH&E Manager** shall:
- Monitor compliance with the various aspects of this program.
 - Provide technical assistance regarding respirator selection and use, evaluate the effectiveness of this program, and support respirator training and fit testing.
 - Audit company compliance with this procedure.
- 4.1.4 **Employees** shall:
- Will use the provided respiratory protection in accordance with instructions and training received.
 - Will guard against damage to the respirator.
 - Will report immediately any malfunction of the respirator to the supervisor or other responsible person.

4.2 Medical Surveillance

No employee shall be assigned to a task that requires the use of a respirator unless it has been determined that he/she is physically able to perform the work while using the required respirator.

- 4.2.1 Prior to wearing a respirator, **employees** will complete an initial baseline medical surveillance examination performed by a PLHCP in accordance with the requirements of the Medical Surveillance Program (*S3NA-605- PR Medical Surveillance Program*).
- 4.2.2 **Employees** who continue to use respiratory protection will receive an annual medical surveillance examination.
- 4.2.3 Additional medical examinations will be provided to employees who wear respirators if/when:
- An **employee** reports medical signs or symptoms that are related to ability to use a respirator;
 - A PLHCP, supervisor, or the respirator program administrator determines that an employee needs to be reevaluated;
 - Information from the respiratory protection program, including observations made during fit testing and program evaluation, indicates a need for employee reevaluation; or
 - A change occurs in workplace conditions (e.g., physical work effort, protective clothing, temperature, etc.) that may result in a substantial increase in the physiological burden placed on an employee.
- 4.2.4 All medical surveillance examinations shall occur during normal working hours; shall be convenient, understandable, and confidential; and the employee will be given chance to discuss results with examining physician.
- 4.3 Training**
- 4.3.1 Project staff that may be exposed to the hazard will be oriented to the hazard and the controls prior to beginning work.
- 4.3.2 Atmospheric testing will be carried out by someone trained in the use, calibration, and interpretation of the test equipment.
- 4.3.3 **Employees** who may be required to use a breathing apparatus shall be properly trained in the operation, maintenance, cleaning and storage of the apparatus.
- 4.3.4 All staff will receive an orientation to the hazards on the job site as well as initial Field Safety training which outlines appropriate PPE requirements.
- 4.3.5 **Employees** who wear respiratory protection must receive training before they are assigned to a task that requires the use of respiratory protection.
- 4.3.6 Retraining shall be administered annually, and when the following situations occur:
- Changes in the workplace or the type of respirator render previous training obsolete;
 - Inadequacies in the employee's knowledge or use of the respirator indicate that the employee has not retained the requisite understanding or skill; or
 - Any other situation arises in which retraining appears necessary to verify safe respirator use.
- 4.3.7 Frequency of Training
- All employees who may have the need to wear respiratory protection are required to participate in AECOM's internal SH&E training program.
 - In addition, AECOM's SH&E Department will conduct respirator training classes, as necessary, for those who may need to wear respiratory protection but did not participate in AECOM's HAZWOPER training classes.
- 4.3.8 Basic Respirator Training Program
- Respirator training classes will include, at a minimum, the following:
- Instruction in the nature of the respiratory hazards, whether acute, chronic, or both, and a description of potential health effects if the respirators are not used.

- Why the respirator is necessary and how improper fit, usage, or maintenance can compromise the protective effect of the respirator.
- The limitations and capabilities of the respirator.
- Proper fitting, including demonstrations and practice in wearing, adjusting, determining the fit of, and performing a user seal check (in accordance with *S3NA-519-WI1 Fit Testing Protocol*) each time respirator is donned.
- How to inspect, put on, use and remove the respirator.
- How to use the respirator effectively in emergency situations, including situations in which the respirator malfunctions.
- The procedures for maintenance and storage of the respirator.
- How to recognize medical signs and symptoms that may limit or prevent the effective use of respirators.
- The general requirements of the OSHA and OH&S Respiratory Protection Standard.

4.4 **Respirator Selection**

- 4.4.1 AECOM will maintain air purifying respirators and cartridges from at least two providers (i.e. MSA and North).
- 4.4.2 Prior to fit testing, the employee shall be allowed to pick the most comfortable respirator from the brands offered.
- 4.4.3 The type of respirator most commonly used by AECOM staff is a cartridge type air purifying respirator (APR). Many different types of APRs exist, and field staff should always fit test an APR prior to use.

4.5 **Fit Testing Procedures**

- 4.5.1 A respirator that doesn't fit properly will not provide adequate protection.
- 4.5.2 Four types of tests can be used:
 - Positive Pressure Sealing Check: Close off the exhalation valve and exhale gently. The fit is satisfactory if a slight positive pressure can be built up inside the face piece for a full 10 seconds without detecting any outward leakage of air between the sealing surface of the face piece and the wearer's face.
 - Negative Pressure Sealing Check: Close off the inlet opening of the cartridges by covering them with the palm of the hands. Inhale gently and hold breath for at least 10 seconds. The face piece should collapse slightly with no detection of inward leakage of air into the face piece.
 - Isoamyl Acetate Test (banana oil test): A tube or bottle of banana oil is held in front of and around the mask. The fit is adequate if the wearer does not detect the odour of bananas. During the test, the wearer should be demonstrating movements that approximate a normal working situation, including deep breathing, side-to-side and up-and-down head movements, and talking.
 - Irritant Smoke Test (Stannic Chloride Test): The procedure is similar to that of the banana oil test except that an irritant smoke is used. The wearer of the mask will cough (involuntary reaction) if he/she detects the irritant smoke in the mask.
- 4.5.3 Fit Testing Frequency

Additional fit tests will be performed:

 - Whenever there is an indication that changes in the **employee's** physical condition might have an effect on respirator fit. (Such conditions include, but are not limited to, facial scarring, dental changes, cosmetic surgery, or an obvious change in body weight.)
 - Whenever there is an indication that changes in the **employee's** physical condition might have an effect on respirator fit. (Such conditions include, but are not limited to, facial scarring, dental changes, cosmetic surgery, or an obvious change in body weight.)
 - If the **employee** notifies his/her supervisor or Regional SH&E Manager that the fit of his/her respirator is unacceptable.

4.5.4 Fit Testing Records

A written record of each fit test performed must be maintained in the **employee's** health and safety records. *S3NA-519-FM1 Respiratory Equipment Fit Test* will be used to document each fit test.

4.6 Interference with Gas-Tight Seal

Respiratory protection can only be worn when it can be determined that there is no obstruction of contact between the wearer's skin and the sealing surfaces of the mask whatsoever. Such obstruction can include facial hair, head hair, and the temple bars of eye glasses.

4.6.1 Respirator wearers cannot be afforded protection from hazardous airborne contaminants when conditions prevent a complete gas-tight face seal.

4.6.2 Although eyeglass temple bars will interfere with the formation of a gas-tight face seal in the case of full-face respirators, this problem is correctable by use of internally mounted spectacle kits. Management and supervisors shall verify that **employees** under their supervision who regularly wear eyeglasses, and who will require the use of a full-face respirator, are provided with appropriate spectacle kits at company expense.

The use of contact lenses in hazardous atmospheres or in operations involving intense heat, molten metals or the potential for chemical splash shall be prohibited.

4.6.3 Because facial hair (even beard stubble) will interfere with a gas-tight seal, employees shall be required to be clean-shaven whenever the use of respiratory protection is specified.

4.6.4 Respiratory Protection will only be assigned to those **employees** without physical obstructions to a gas-tight face seal to jobs that may require the use of respiratory protection. Candidates for employment shall be made aware that their versatility may be limited if they cannot wear a respirator and that this can affect their job assignments.

4.7 Specification of Proper Level of Respiratory Protection

4.7.1 The **Region SH&E Manager** or his/her designated and qualified representative is responsible for specifying the proper selection and use of all respiratory protective devices, including half-face and full-face air purifying respirators, airline respirators, and self-contained breathing apparatus. This information is generally specified as part of the written site-specific Health and Safety Plan (HASP).

4.7.2 **Employees** engaged in activities not covered by a HASP must consult with the **Region SH&E Manager** or his/her designated representative to determine the proper equipment prior to use. Whenever appropriate, exposure levels will be measured to verify that the actual use conditions are within the limitations of the approvals specified by NIOSH/MSHA for the selected respirator.

4.7.3 Conditions Required for Air-Purifying Respirator (APR) Use

Air-purifying respirators (APR) shall only be specified for use when it can be determined that the following conditions exist:

- The oxygen concentration is greater than 19.5%.
- The contaminant is known and its concentration can be quantified.
- The airborne contaminant concentration is below its IDLH.
- A canister or cartridge is available which is approved for the contaminant.
- The contaminant concentration is below the concentration for which the canister is approved.
- The contaminant concentration is below the Maximum Use Concentration (MUC) of the respirator.

In all cases where OSHA has specified that a particular respirator be used (asbestos, formaldehyde, benzene, arsenic, lead, etc.), that respirator, or one providing equal or better protection, shall be specified.

4.7.4 APR Filter and Chemical Cartridges

An adequate supply of the following cartridges shall be maintained in stock at each office location where respiratory protective equipment:

- High efficiency particulate air (HEPA) filter cartridges;
- Organic vapor cartridges; and
- Combination HEPA/acid gas/organic vapor cartridges

4.7.5 Change Out Schedule

Filter cartridges shall be changed out whenever an increase in breathing resistance is detected by the user.

When available, chemical cartridges that are equipped with end-of-service life indicators (ESLI) shall be utilized. In those cases, cartridges should be changed when indicated by the ESLI.

In the absence of cartridges equipped with an ESLI, employees shall change chemical cartridges on the following schedule:

- Immediately if breakthrough is perceived;
- In accordance with the change out schedule developed by the Regional SH&E Manager in the site-specific Health and Safety Plan (HASP); and
- After each day's use.

The change out schedule will be based upon the anticipated contaminant concentration, environmental conditions, employee work rate, and the specific data provided by manufacturer

When powered air-purifying respirators (PAPRs) are worn, the same rules apply with the exception that filter cartridges should be changed when airflow through the filter elements decreases to an unacceptable level, as indicated by the manufacturer's test device.

4.8 Air-Supplying Respirator Use

4.8.1 Conditions Requiring Use of Air-Supplying Respirators

Air-supplying respirators will be specified for use when it has been determined that any of the following conditions exist:

- The oxygen concentration is less than 19.5%;
- The contaminant is unknown or its concentration cannot be quantified;
- The airborne contaminant concentration is above its IDLH;
- An air-purifying respirator canister or cartridge that removes the contaminant is not available;
- The contaminant concentration is above the concentration for which an air-purifying canister or cartridge is approved; or
- The contaminant concentration is above the Maximum Use Concentration (MUC) of a full-face air-purifying respirator.

No employee may engage in an operation requiring the use of an air-supplied respirator unless a representative of the SH&E Department has reviewed the operation and approved its use.

The determination of the type of air-supplying respirator (i.e., SCBA, air-line, demand, pressure demand, etc.) which is appropriate for the job, outside standby persons, communication, proper training and equipment, notification procedures, and necessary action all require planning. Mandatory equipment including SCBA or SAR with auxiliary air supply & emergency appropriate retrieval equipment or equivalent rescue means will be made by the **Region SH&E Manager** or his/her designated representative at the time of review. The need for any additional precautions (i.e.,

equipment specific training, on-site H&S support, etc.) will also be determined by the **Region SH&E Manager**.

4.9 **Minimum Procedures for IDLH atmospheres**

- 4.9.1 One **employee** or, when needed, more than one employee shall be located outside the IDLH atmosphere. This employee shall be responsible for communicating with the **employees** in the IDLH atmosphere, alerting rescue services if needed, and restricting entrance to the IDLH area by untrained and unapproved persons.
- 4.9.2 Visual, voice, or signal line communication shall be maintained between the **employee(s)** in the IDLH atmosphere and the employee(s) located outside the IDLH atmosphere.
- 4.9.3 The **employee(s)** located outside the IDLH atmosphere shall be trained and equipped to provide effective emergency rescue or to initiate onsite rescue services.
- 4.9.4 If on-site rescue services are to be used, the **Site Safety Officer** shall confirm that the service is available to respond prior to any employees entering the IDLH area.
- 4.9.5 **Employee(s)** located outside the IDLH area and/or on-site rescue services shall be equipped with:
- Pressure demand or other positive pressure SCBAs, or a pressure demand or other positive pressure supplied-air respirator with auxiliary SCBA; and either
 - Appropriate retrieval equipment for removing the employee(s) who enter(s) these hazardous atmospheres where retrieval equipment would contribute to the rescue of the employee(s) and would not increase the overall risk resulting from entry; or
 - Equivalent means for rescue where retrieval equipment would create a hazard to the workers in the IDLH area.

4.10 **Breathing Air Quality**

Compressed air used for respiration shall be of high purity and shall meet, as a minimum, the requirements of the specification for Grade D breathing air as described in Compressed Gas Association Specification G-7.1 (ANSI Z86.1).

Oxygen shall NOT be used as a source of breathing air at any time in open-circuit SCBAs or air-line respirators.

4.10.1 **Compressor Supplied Breathing Air**

All compressors used for filling SCBA air cylinders or for supplying air-line respirators shall be equipped with the following safety and standby devices:

- The compressor intake shall be located to verify that only respirable (uncontaminated) air is admitted. This requires attention to the location of the compressor intake with respect to compressor engine exhaust, chemical storage or use areas, and suitable intake screening or filtration.
- Alarms to indicate compressor failure (such as low-pressure air horns, etc.) shall be installed in the system.
- A receiver of sufficient capacity to enable the respirator wearer to exit from a contaminated atmosphere shall be provided.

If an oil-lubricated compressor is used to supply breathing air, it shall be equipped with both of the following devices:

- A continuous reading carbon monoxide monitoring system set to alarm should the carbon monoxide concentration exceed 10 ppm; and,
- A high temperature alarm which will activate when the discharge air exceeds 110% of the normal operating temperature in degrees Fahrenheit.

An in-line purifying filter assembly to remove oil, condensed water, particulates, odors, and organic vapors shall be used in conjunction with the air compressor.

Routine inspection and maintenance of air compressor shall be performed.

4.10.2 Compressed Air Cylinders

Breathing air cylinders shall be legibly identified with the word AIR by means of stenciling, stamping, or labeling as near to the valve end as practical.

Cylinders shall be stored and handled to prevent damage to the cylinder or valve.

Cylinders shall be stored upright with the protective valve cover in place and, in such a way (e.g. supported with substantial rope or chain in the upper one third of the cylinder, or in racks designed for this purpose) as to prevent the cylinder from falling.

Cylinders shall not be dropped, dragged, rolled, or allowed to strike each other or to be struck violently. Cylinders shall never be exposed to temperatures exceeding 125° F. Cylinders with visible external damage, evidence of corrosion damage, or exposure to fire shall not be accepted or used.

Only cylinders within current hydrostatic test periods shall be used. Steel cylinders must be hydrostatically tested every five years and fiberglass wrapped aluminum cylinders must be tested every three years.

4.10.3 Compressed Air Cylinder Systems for Air-Line Respirators

Compressed air cylinder systems used to supply air-line respirators shall be equipped with low pressure warning bells (e.g., Scott Pak-Alarm) or similar warning devices to indicate air pressure in the manifold below 500 psi. When such systems are used, one employee shall be assigned as safety standby within audible range of the low pressure alarm.

Air-line hose couplings shall be incompatible with outlets for other gas systems to prevent inadvertently supplying air-line respirators with nonrespirable gases or oxygen.

The air pressure at the hose connection to air-line respiratory equipment shall be within the range specified in the approval of the equipment by the manufacturer.

4.10.4 Compressed Air Cylinder Systems for Recharging SCBAs

When a cascade system is used to recharge SCBA air cylinders, it shall be equipped with a high-pressure supply hose and coupling rated at a capacity of at least 3000 psi.

4.10.5 Escape/Egress Units

Escape/egress unit respirators are intended for use in areas where escape with a short-term (5 minutes) air supply is necessary.

They may be used as adjuncts to airline pressure demand respirators as a backup air supply or as independent emergency devices in areas where respiratory protection is not normally required.

Appropriate training shall be conducted and documented prior to assigning employees to tasks or locations subject to the use of these respirators.

Escape/egress units (5 minutes) shall never be used to enter a hazardous atmosphere or as primary standby respirators for confined space entry.

4.10.6 Respirator Inspection, Cleaning, Maintenance, and Storage

When respirator use is required, only properly cleaned and maintained NIOSH/MSHA approved respirators shall be used.

4.10.7 Inspection

- Respirators should be inspected before and after use. Those for emergency use should be inspected once per month.
- All connections, including gaskets, o-rings should be checked for damage and tightness.
- The face piece should be inspected for cracks and rubber or elastomer parts should be checked for deterioration and pliability.
- All respirators shall be inspected routinely by the user before, during, and after each use. Defects shall be reported to supervision. No defective respirator shall be issued or worn.

- Routinely used respiratory equipment shall be inspected by an individual qualified by experience or training to do the work.

4.10.8 Cleaning and Maintenance

- Respirator facepiece assemblies shall be cleaned and sanitized minimally after each day of use in accordance with the requirements specified in *S3NA-519-WI3 Respirator Cleaning Procedures*.
- Respiratory equipment shall not be passed from one person to another until it has been cleaned and sanitized.
- Respiratory equipment shall be maintained according to manufacturer's instructions.
- Where respirators are assigned to individual employees, management shall verify compliance with cleaning and maintenance requirements by periodic inspection and field audits of respiratory equipment.
- Respirators must be cleaned after each use and then placed into a clean bag for storage.
- Prior to cleaning, the filters, cartridges, or canisters must be removed and discarded.
- The respirator should then be inspected for any damaged parts (repair should only be done by trained personnel with the proper tools) and cleaned with a hot water/mild detergent solution.
- In field situations, a premoistened towelette (e.g., baby wipes) can be used. The mask should then be rinsed with clean warm water and dried.
- Alcohol should never be used to clean masks as it can damage the face pieces and rubber parts.

4.10.9 Storage

- Store clean respirators so that they are protected from dust, excessive moisture, damaging chemicals, temperature extremes and direct sunlight. They should be placed in a sealed plastic bag and stored in the original box.

When not in use, respirator facepieces shall be placed in clean Ziploc-style bags and stored to protect against dust, sunlight, extreme temperatures, excessive moisture, and damaging chemicals.

4.11 Hygiene

Employees must leave the work area to wash, change cartridges, or if they detect breakthrough or resistance.

4.12 Program Evaluation

4.12.1 The **Region SH&E Manager** will conduct evaluations of the workplace as necessary to verify that the provisions of the current written program are being effectively implemented and that it continues to be effective.

4.12.2 The **Region SH&E Manager** will regularly (i.e., during annual training) consult employees required to use respirators to assess their views on program effectiveness and to identify any problems. Any problems that are identified during this assessment shall be corrected. Factors to be assessed include but are not limited to:

- Respirator fit (including the ability to use the respirator without interfering with effective workplace performance);
- Appropriate respirator selection for the hazards to which the employee is exposed;
- Proper respirator use under the workplace conditions the employee encounters; and
- Proper respirator maintenance.

4.13 Costs

- 4.13.1 The costs for training, medical examinations, fit testing, respirators, and cleaning materials should be considered as operational costs for the respective AECOM business lines.

5.0 Records**5.1 Medical Records**

Medical records under this section will be maintained at a minimum in accordance with 29 CFR 1910.1020 – Access to Employee Exposure and Medical Records (*S3NA-604 Medical Records*).

5.2 Fit Test Records

Fit test records will include the name of the employee tested; the type of fit test performed; the specific style, make, model, and size of the respirator tested; the date of the test; and the pass/fail results for QLFTs or QNFT test documentation (i.e., strip charts).

5.3 Training Records

- Respiratory protection training records will be maintained by the employee with copies provided to their SH&E Coordinators or Administrators.
- On-site records of training and fit testing will be maintained as necessary.
- For situations where training is required by and provided by clients, copies of SH&E Records shall be maintained by AECOM.

6.0 References

- 6.1 The following standards apply to respiratory equipment:

Instructions <ol style="list-style-type: none"> 1. Complete the employee information at the top of the record (one record per employee). 2. Enter the date of the test and the name of the person conducting the fit test. 3. Circle the brand and model of respirator tested (e.g., MSA Comfo II, North 7700, etc.) or enter another brand and model in one of the last two columns. 4. Circle the size of the respirator tested. 5. For qualitative fit tests, circle the test agent used - IAA = Isoamyl Acetate, Smoke = Irritant Smoke (Stannic Chloride) and the outcome of the test (i.e., Pass or Fail). 6. For quantitative fit tests, enter the name of the instrument used and the overall fit factor measured by the test. 7. Keep a copy in the employee's training files and enter subsequent (e.g., annual) tests until the record is filled.

Unit Deemed Suitable for Use		<input type="checkbox"/> Yes		<input type="checkbox"/> No

S3NA-519-WI1 Fit Testing Protocol

1.0 Selection

- 1.1 The test subject shall be allowed to pick the most acceptable respirator from a sufficient number of respirator models and sizes so that the respirator is acceptable to, and correctly fits, the user.
- 1.2 Prior to the selection process, the test subject shall be shown how to put on a respirator, how it should be positioned on the face, how to set strap tension, and how to determine an acceptable fit. A mirror shall be available to assist the subject in evaluating the fit and positioning of the respirator. This instruction may not constitute the subject's formal training on respirator use, because it is only a review.
- 1.3 The test subject shall be informed that he/she is being asked to select the respirator that provides the most acceptable fit. Each respirator represents a different size and shape and if fitted and used properly will provide adequate protection.

2.0 Comfort

- 2.1 The test subject shall be instructed to hold each chosen face piece up to the face and to eliminate those that obviously do not give an acceptable fit.
- 2.2 The more acceptable face pieces are noted in case the one selected proves unacceptable; the most comfortable mask is donned and worn at least five minutes to assess comfort.
- 2.3 If the test subject is not familiar with using a particular respirator, the test subject shall be directed to don the mask several times and to adjust the straps each time to become adept at setting proper tension on the straps.
- 2.4 Assessment of comfort shall include a review of the following points with the test subject and allowing the test subject adequate time to determine the comfort of the respirator:
 - Position of the mask on the nose
 - Room for eye protection
 - Room to talk
 - Position of mask on face and cheeks

3.0 Fit Test Criteria

- 3.1 The following criteria shall be used to help determine the adequacy of the respirator fit:
 - Chin properly placed;
 - Adequate strap tension, not overly tightened;
 - Fit across nose bridge;
 - Respirator of proper size to span distance from nose to chin;
 - Tendency of respirator to slip;
 - Self-observation in mirror to evaluate fit and respirator position.
- 3.2 The test subject shall conduct a user seal check, either the negative and positive pressure seal checks described in *S3NA-519-WI2 User Seal Check Procedures* or those recommended by the respirator manufacturer that provide equivalent protection to the procedures in *S3NA-519-WI2 User Seal Check Procedures*.
- 3.3 Before conducting the negative and positive pressure checks, the subject shall be told to seat the mask on the face by moving the head from side to side and up and down slowly while taking in a few slow deep breaths. Another face piece shall be selected and retested if the test subject fails the user seal check tests.
- 3.4 The test shall not be conducted if there is any hair growth between the skin and the face piece sealing surface, such as stubble beard growth, beard, mustache, or sideburns that cross the

respirator sealing surface. Any type of apparel that interferes with a satisfactory fit shall be altered or removed.

- 3.5 If a test subject exhibits difficulty in breathing during the tests, she or he shall be referred to a physician or other licensed health care professional, as appropriate, to determine whether the test subject can wear a respirator while performing her or his duties.
- 3.6 If the employee finds the fit of the respirator unacceptable, the test subject shall be given the opportunity to select a different respirator and to be retested.

4.0 Exercise Regimen

- 4.1 Prior to the commencement of the fit test, the test subject shall be given a description of the fit test and the test subject's responsibilities during the test procedure. The description of the process shall include a description of the test exercises that the subject will be performing. The respirator to be tested shall be worn for at least 5 minutes before the start of the fit test.
- 4.2 The fit test shall be performed while the test subject is wearing any applicable safety equipment that may be worn during actual respirator use and that could interfere with respirator fit.

5.0 General Test Exercises

- 5.1 The following test exercises are to be performed for all fit testing methods prescribed in this appendix, except for the CNP method. A separate fit testing exercise regimen is contained in the CNP protocol. The test subject shall perform exercises, in the test environment, in the following manner:
- 5.1.1 **Normal breathing.** In a normal standing position, without talking, the subject shall breathe normally.
- 5.1.2 **Deep breathing.** In a normal standing position, the subject shall breathe slowly and deeply, taking caution so as not to hyperventilate.
- 5.1.3 **Turning head side to side.** Standing in place, the subject shall slowly turn his/her head from side to side between the extreme positions on each side. The head shall be held at each extreme momentarily so the subject can inhale at each side.
- 5.1.4 **Moving head up and down.** Standing in place, the subject shall slowly move his/her head up and down. The subject shall be instructed to inhale in the up position (i.e., when looking toward the ceiling).
- 5.1.5 **Talking.** The subject shall talk out loud slowly and loud enough so as to be heard clearly by the test conductor. The subject can read from a prepared text such as the Rainbow Passage, count backward from 100, or recite a memorized poem or song.
- 5.1.6 **Rainbow Passage.** "When the sunlight strikes raindrops in the air, they act like a prism and form a rainbow. The rainbow is a division of white light into many beautiful colors. These take the shape of a long round arch with its path high above and its two ends apparently beyond the horizon. There is, according to legend, a boiling pot of gold at one end. People look, but no one ever finds it. When a man looks for something beyond reach, his friends say he is looking for the pot of gold at the end of the rainbow."
- 5.1.7 **Grimace.** The test subject shall grimace by smiling or frowning. (This applies only to QNFT testing; it is not performed for QLFT.)
- 5.1.8 **Bending over.** The test subject shall bend at the waist as if he/she were to touch his/her toes. Jogging in place shall be substituted for this exercise in those test environments such as shroud type QNFT or QLFT units that do not permit bending over at the waist.
- 5.1.9 **Normal breathing.** In a normal standing position, without talking, the subject shall breathe normally (this is the same as the first test).
- 5.2 Each test exercise shall be performed for one minute except for the grimace exercise, which shall be performed for 15 seconds.
- 5.3 The test subject shall be questioned by the test conductor regarding the comfort of the respirator upon completion of the protocol. If it has become unacceptable, another model of respirator shall be tried.
- 5.4 The respirator shall not be adjusted once the fit test exercises begin. Any adjustment voids the test and the fit test must be repeated.

6.0 Qualitative Fit Test (QLFT) Protocols

6.1 General

6.1.1 AECOM will ensure that persons administering QLFT are able to calibrate equipment and perform tests properly, recognize invalid tests, and ensure that test equipment is in proper working order.

6.1.2 AECOM will ensure that that QLFT equipment is kept clean and well maintained so as to operate within the parameters for which it was designed.

6.2 Irritant Smoke (Stannic Chloride) Protocol

6.2.1 This qualitative fit test uses a person's response to the irritating chemicals released in the "smoke" produced by a stannic chloride ventilation smoke tube to detect leakage into the respirator.

6.2.2 General Requirements and Precautions:

- The respirator to be tested shall be equipped with high efficiency particulate air (HEPA) or P100 series filter(s).
- Only stannic chloride smoke tubes shall be used for this protocol.
- No form of test enclosure or hood for the test subject shall be used.
- The smoke can be irritating to the eyes, lungs, and nasal passages. The test conductor shall take precautions to minimize the test subject's exposure to irritant smoke. Sensitivity varies, and certain individuals may respond to a greater degree to irritant smoke. Care shall be taken when performing the sensitivity screening checks that determine whether the test subject can detect irritant smoke to use only the minimum amount of smoke necessary to elicit a response from the test subject.
- The fit test shall be performed in an area with adequate ventilation to prevent exposure of the person conducting the fit test or the build-up of irritant smoke in the general atmosphere.

6.2.3 Sensitivity Screening Check

The person to be tested must demonstrate his or her ability to detect a weak concentration of the irritant smoke.

- The test operator shall break both ends of a ventilation smoke tube containing stannic chloride and attach one end of the smoke tube to a low flow air pump set to deliver 200 milliliters per minute or to an aspirator squeeze bulb. The test operator shall cover the other end of the smoke tube with a short piece of tubing to prevent potential injury from the jagged end of the smoke tube.
- The test operator shall advise the test subject that the smoke can be irritating to the eyes, lungs, and nasal passages and instruct the subject to keep his/her eyes closed while the test is performed.
- The test subject shall be allowed to smell a weak concentration of the irritant smoke before the respirator is donned to become familiar with its irritating properties and to determine if he/she can detect the irritating properties of the smoke. The test operator shall carefully direct a small amount of the irritant smoke in the test subject's direction to determine that he/she can detect it.

6.2.4 Irritant Smoke Fit Test Procedure

- The person being fit tested shall don the respirator without assistance, and perform the required user seal check(s).
- The test subject shall be instructed to keep his/her eyes closed.
- The test operator shall direct the stream of irritant smoke from the smoke tube toward the face seal area of the test subject, using the low flow pump or the squeeze bulb. The test operator shall begin at least 12 inches from the face piece and move the smoke stream around the whole perimeter of the mask. The operator shall gradually make two more passes around the perimeter of the mask, moving to within six inches of the respirator.

- If the person being tested has not had an involuntary response and/or has not detected the irritant smoke, proceed with the test exercises.
- The General Test Exercises (Section 5.0) shall be performed by the test subject while the respirator seal is being continually challenged by the smoke, directed around the perimeter of the respirator at a distance of six inches.
- If the person being fit tested reports detecting the irritant smoke at any time, the test is failed. The person being retested must repeat the entire sensitivity check and fit test procedure.
- Each test subject passing the irritant smoke test without evidence of a response (involuntary cough, irritation) shall be given a second sensitivity screening check, with the smoke from the same smoke tube used during the fit test, once the respirator has been removed, to determine whether he/she still reacts to the smoke. Failure to evoke a response shall void the fit test.
- If a response is produced during this second sensitivity check, then the fit test is passed.

7.0 Quantitative Fit Test (QNFT) Protocols

7.1 General

- AECOM will confirm that persons administering QNFT are able to calibrate equipment and perform tests properly, recognize invalid tests, calculate fit factors properly, and ensure that test equipment is in proper working order.
- AECOM will ensure that QNFT equipment is kept clean and is maintained and calibrated according to the manufacturer's instructions so as to operate at the parameters for which it was designed.

7.2 Ambient Aerosol Condensation Nuclei Counter (CNC) Quantitative Fit Testing Protocol

7.2.1 The ambient aerosol condensation nuclei counter (CNC) quantitative fit testing (Portacount TM) protocol quantitatively fit tests respirators with the use of a probe. The probed respirator is only used for quantitative fit tests. A probed respirator has a special sampling device installed on the respirator to allow the probe to sample the air from inside the mask. A probed respirator is required for each make, style, model, and size that the employer uses and can be obtained from the respirator manufacturer or distributor. The CNC instrument manufacturer, TSI Inc., also provides probe attachments (TSI sampling adapters) that permit fit testing in an employee's own respirator. A minimum fit factor pass level of at least 100 is necessary for a half-mask respirator, and a minimum fit factor pass level of at least 500 is required for a full face piece negative pressure respirator. The entire screening and testing procedure shall be explained to the test subject prior to the conduct of the screening test.

7.2.2 Portacount Fit Test Requirements

- Check the respirator to make sure the sampling probe and line are properly attached to the face piece and that the respirator is fitted with a particulate filter capable of preventing significant penetration by the ambient particles used for the fit test (e.g., NIOSH 42 CFR 84 series 100, series 99, or series 95 particulate filter) according to the manufacturer's instructions.
- Instruct the person to be tested to don the respirator for five minutes before the fit test starts. This purges the ambient particles trapped inside the respirator and permits the wearer to make certain the respirator is comfortable. This individual shall already have been trained on how to wear the respirator properly.
- Check the following conditions for the adequacy of the respirator fit: chin properly placed; adequate strap tension, not overly tightened; fit across nose bridge; respirator of proper size to span distance from nose to chin; tendency of the respirator to slip; self-observation in a mirror to evaluate fit and respirator position.
- Have the person wearing the respirator do a user seal check. If leakage is detected, determine the cause. If leakage is from a poorly fitting face piece, try another size of the same model respirator, or another model of respirator.
- Follow the manufacturer's instructions for operating the Portacount and proceed with the test.
- The test subject shall be instructed to perform the exercises in General Test Exercises (Section 5.0).

- After the test exercises, the test subject shall be questioned by the test conductor regarding the comfort of the respirator upon completion of the protocol. If it has become unacceptable, another model of respirator shall be tried.

7.2.3 **Portacount Test Instrument**

- The Portacount will automatically stop and calculate the overall fit factor for the entire set of exercises. The overall fit factor is what counts. The Pass or Fail message will indicate whether or not the test was successful. If the test was a Pass, the fit test is over.
- Since the pass or fail criterion of the Portacount is user programmable, the test operator shall confirm that the pass or fail criterion meet the requirements for minimum respirator performance.
- A record of the test needs to be kept on file, assuming the fit test was successful. The record must contain the test subject's name; overall fit factor; make, model, style, and size of respirator used; and date tested.

S3NA-519-WI2 User Seal Check Procedures

1.0 Requirements

- 1.1 The individual who uses a tight-fitting respirator is to perform a user seal check to confirm that an adequate seal is achieved each time the respirator is put on.
- 1.2 Either the positive and negative pressure checks listed here or the respirator manufacturer's recommended user seal check method shall be used.
- 1.3 User seal checks are not substitutes for qualitative or quantitative fit tests.

2.0 Facepiece Positive and/or Negative Pressure Checks

2.1 Positive pressure check

- 2.1.1 Close off the exhalation valve and exhale gently into the facepiece.
- 2.1.2 The face fit is considered satisfactory if a slight positive pressure can be built up inside the facepiece without any evidence of outward leakage of air at the seal.
- 2.1.3 For most respirators, this method of leak testing requires the wearer to first remove the exhalation valve cover before closing off the exhalation valve and then carefully replacing it after the test.

2.2 Negative pressure check

- 2.2.1 Close off the inlet opening of the canister or cartridge(s) by covering with the palm of the hand(s) or by replacing the filter seal(s), inhale gently so that the facepiece collapses slightly, and hold your breath for 10 seconds.
- 2.2.2 The design of the inlet opening of some cartridges cannot be effectively covered with the palm of the hand.
- 2.2.3 The test can be performed by covering the inlet opening of the cartridge with a thin latex or nitrile glove.
- 2.2.4 If the facepiece remains in its slightly collapsed condition and no inward leakage of air is detected, the tightness of the respirator is considered satisfactory.

3.0 Manufacturer's Recommended User Seal Check Procedures

- 3.1 The respirator manufacturer's recommended procedures for performing a user seal check may be used instead of the positive and/or negative pressure check procedures, provided that the employer demonstrates that the manufacturer's procedures are equally effective.

S3NA-519-WI3 Respirator Cleaning Procedures

1.0 Requirements

- 1.1 These procedures are general in nature. The cleaning recommendations provided by the manufacturer may be used for the respirators used by their employees, provided such procedures are as effective as those listed here.
- 1.2 Equivalent effectiveness simply means that the procedures used must accomplish the objectives set forth (i.e., confirm that the respirator is properly cleaned and disinfected in a manner that prevents damage to the respirator and does not cause harm to the user).

2.0 Procedures for Cleaning Respirators

- 2.1 Remove filters, cartridges, or canisters. Disassemble facepieces by removing speaking diaphragms, demand and pressure-demand valve assemblies, hoses, or any components recommended by the manufacturer. Discard or repair any defective parts.
- 2.2 Wash components in warm (43°C [110°F] maximum) water with a mild detergent or with a cleaner recommended by the manufacturer. A stiff bristle (not wire) brush may be used to facilitate the removal of dirt.
- 2.3 Rinse components thoroughly in clean, warm (43°C [110°F] maximum), preferably running water. Drain.
- 2.4 When the cleaner used does not contain a disinfecting agent, respirator components should be immersed for two minutes in one of the following:
 - Hypochlorite solution (50 ppm of chlorine) made by adding approximately one milliliter of laundry bleach to one liter of water at 43°C (110°F); or,
 - Aqueous solution of iodine (50 ppm iodine) made by adding approximately 0.8 milliliters of tincture of iodine (6-8 grams ammonium and/or potassium iodide/100 cc of 45% alcohol) to one liter of water at 43°C (110°F); or,
 - Other commercially available cleansers of equivalent disinfectant quality when used as directed, if their use is recommended or approved by the respirator manufacturer.
- 2.5 Rinse components thoroughly in clean, warm (43°C [110°F] maximum), preferably running water. Drain. The importance of thorough rinsing cannot be overemphasized. Detergents or disinfectants that dry on facepieces may result in dermatitis. In addition, some disinfectants may cause deterioration of rubber or corrosion of metal parts if not completely removed.
- 2.6 Components should be hand dried with a clean, lint-free cloth or air-dried.
- 2.7 Reassemble facepiece, replacing filters, cartridges, and canisters where necessary.
- 2.8 Test the respirator to ensure that all components work properly.
- 2.9 After the fit test, wipe down the respirator with a sanitary swab.

S3NA-520-PR Spill Response, Incidental

1.0 Purpose and Scope

- 1.1 This procedure defines the role of AECOM employees in the event of a chemical spill in AECOM offices, laboratories, or storage areas and during field investigations, including the appropriate containment procedures that AECOM employees will follow.
- 1.2 This procedure applies to all AECOM North America-based employees and operations.

2.0 Terms and Definitions

- 2.1 **Emergency Response:** A response effort by employees from outside the immediate release area or by other designated responders (i.e., mutual aid groups, local fire departments, etc.) to an occurrence that results, or is likely to result, in an uncontrolled release of a hazardous substance or whenever a release requires that a federal or state agency be notified, such as:
 - 2.1.1 A release at or above a reportable quantity (RQ) of a Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) hazardous substance (40 CFR 302.8) is required to be reported to the National Response Center (NRC).
 - 2.1.2 A hazardous chemical release at or above an RQ under the Emergency Planning and Community Right-to-Know Act (EPCRA) (Title III under the Superfund Amendments and Reauthorization Act (SARA) (40 CFR 350-372) is required to be reported to state and local officials.
 - 2.1.3 A release in violation of a facilities Spill Prevention, Control, and Countermeasure (SPCC) Plan (40 CFR 112).
- 2.2 **Incidental Releases:** A response to a spill or release of a hazardous substance (in quantities below its RQ) where the substance can be absorbed, neutralized, or otherwise controlled at the time of release by employees in the immediate release area using equipment and materials available to them at the time or the spill or release. Any spill or release that cannot be managed with the personnel, materials, and equipment at the site shall be considered an Emergency Response.
 - 2.2.1 Responses to releases of hazardous substances where there is no potential safety or health hazard (i.e., fire, explosion, or chemical exposure) are not considered to be emergency responses. Handling of incidental releases shall be in accordance with applicable standard operating procedures.

3.0 Attachments

- 3.1 None

4.0 Procedure

4.1 Roles and Responsibilities

- 4.1.1 **Supervisor/Project Manager** shall become the individual in charge at the incident until relieved by more qualified personnel. All AECOM emergency responders and their communications shall be coordinated and controlled through this individual. The individual in charge shall implement the Incident Command System (ICS) and shall be responsible for the following tasks:
 - Designate a safety officer who is knowledgeable about the operations being implemented at the emergency response site and who will have specific responsibility to identify and evaluate hazards and to provide direction on the safety of operations for the emergency at hand. If the safety officer judges activities to be an Immediately Dangerous to Life or Health (IDLH) and/or to involve an imminent danger condition, the safety officer shall have the authority to alter, suspend, or terminate those activities. The safety official shall immediately inform the individual in charge of the ICS of any actions needed to be taken to correct these hazards at the emergency scene.

- Identify all hazardous substances or conditions present and address as appropriate site analysis, use of engineering controls, maximum exposure limits, hazardous substance, and handling procedures.
- Implement appropriate emergency operations.
- Limit the number of emergency response personnel at the emergency site.
- Implement the buddy system in groups of two or more.
- Provide standby, backup personnel with equipment ready to provide assistance or rescue. Qualified basic life support personnel, as a minimum, shall also be standing by with medical equipment and transportation as necessary.
- Verify that personal protective equipment (PPE) meets, at a minimum; the criteria contained in 29 CFR 1910.156(e) when worn while performing firefighting operations beyond the incipient stage for any incident.
- Determine if employees, who are engaged in emergency response and exposed to hazardous substances presenting an inhalation hazard or potential inhalation hazard, wear positive pressure self-contained breathing apparatus, until such time that the individual in charge of the ICS determines through the use of air monitoring that a decreased level of respiratory protection is appropriate.
- When deemed necessary for meeting the tasks at hand, an approved, self-contained, compressed air breathing apparatus may be used with approved cylinders from other approved, self-contained, compressed air breathing apparatuses provided that such cylinders are of the same capacity and pressure rating. All compressed air cylinders used with self-contained breathing apparatuses shall meet U.S. Department of Transportation and National Institute for Occupational Safety and Health criteria.
- Ensure that the PPE worn is appropriate for the hazards to be encountered.
- Implement appropriate decontamination procedures after emergency operations have terminated.
- Responsibility for the emergency response shall be transferred upon arrival of a more qualified AECOM Incident Commander or a Public Service Incident Commander.

4.1.2 Region Safety, Health and Environmental Manager is responsible for the following:

- Provide technical assistance to the Incident Commander regarding the correct way to respond to the spill.
- Decide whether AECOM or an outside emergency response company will clean up the spill.
- Prepare project-specific Spill Response Plans when required.
- Report spills, as necessary, to state/provincial environmental agencies.
- Review the incident report and facilitate the post-response discussion.
- Review and revise this SOP as necessary based on recommendations from post-response discussions.

4.1.3 AECOM Employees are responsible for the following:

- Follow precautions and safe handling practices to avoid spills.
- Alert Supervisor/Project Manager to any deteriorating hazardous materials containers within the office or project area.
- Report all spills and leaks to the Supervisor/Project Manager immediately.
- Secure the spill area as quickly as possible and prevent the migration of exterior spilled materials or substances to drains or other openings.

4.1.4 First Responder Awareness Level are those employees who are likely to witness or discover a hazardous substance release and who have been trained to initiate an emergency response by notifying the proper authorities of the release. They take no further action beyond notifying the authorities of the release.

4.1.5 First responders at the awareness level shall have sufficient training or experience to demonstrate competency in the following areas:

- An understanding of what hazardous substances are and the risks associated with them in an incident.
- An understanding of the potential outcomes associated with an emergency created when hazardous substances are present.
- The ability to recognize the presence of hazardous substances in an emergency.
- The ability to identify the hazardous substances, if possible.
- An understanding of the role of the first responder awareness individual in the employer's emergency response plan, including site security and control and the U.S. Department of Transportation's Emergency Response Guidebook.
- The ability to realize the need for additional resources and to make appropriate notifications to the communication center.

4.1.6 **First Responder Operations Level** are individuals who respond to releases or potential releases of hazardous substances as part of the initial response to the site for the purpose of protecting nearby persons, property, or the environment from the effects of the release. They are trained to respond in a defensive fashion without actually trying to stop the release. Their function is to contain the release from a safe distance, keep it from spreading, and prevent exposures.

First responders at the operational level shall receive at least eight hours of training or have had sufficient experience to objectively demonstrate competency in the following areas in addition to those listed for the awareness level:

- Knowledge of the basic hazard and risk assessment techniques.
- Know how to select and use proper PPE provided to the first responder operational level.
- An understanding of basic hazardous materials terms.
- Know how to perform basic control, containment, and/or confinement operations within the capabilities of the resources and PPE available with their unit.
- Know how to implement basic decontamination procedures.
- An understanding of the relevant standard operating procedures and termination procedures.

4.1.7 **Hazardous Materials Technicians** are employees who respond to releases or potential releases for the purpose of stopping the release. They assume a more aggressive role than a first responder at the operations level in that they will approach the point of release in order to plug, patch, or otherwise stop the release of a hazardous substance.

Hazardous materials technicians shall receive at least 24 hours of training equal to the first responder operations level and in addition have competency in the following areas:

- Know how to implement the employer's emergency response plan.
- Know the classification, identification, and verification of known and unknown materials by using field survey instruments and equipment.
- Be able to function within an assigned role in the Incident Command System.
- Know how to select and use proper specialized chemical PPE provided to the hazardous materials technician.
- Understand hazard and risk assessment techniques.
- Be able to perform advance control, containment, and/or confinement operations within the capabilities of the resources and PPE available with the unit.
- Understand and implement decontamination procedures.
- Understand termination procedures.
- Understand basic chemical and toxicological terminology and behavior.

4.1.8 **Hazardous Materials Specialists** are individuals who respond with and provide support to hazardous materials technicians. Their duties parallel those of the hazardous materials technician; however, those

duties require a more directed or specific knowledge of the various substances they may be called upon to contain. The hazardous materials specialist would also act as the site liaison with federal, state, local, and other government authorities.

- 4.1.9 Hazardous materials specialists shall receive at least 24 hours of training equal to the technician level and in addition have competency in the following areas:
- Know how to implement the local emergency response plan.
 - Understand classification, identification, and verification of known and unknown materials by using advanced survey instruments and equipment.
 - Know the state emergency response plan.
 - Be able to select and use proper specialized chemical PPE provided to the hazardous materials specialist.
 - Understand in-depth hazard and risk techniques.
 - Be able to perform specialized control, containment, and/or confinement operations within the capabilities of the resources and PPE available.
 - Be able to determine and implement decontamination procedures.
 - Have the ability to develop a site safety and control plan.
 - Understand chemical, radiological, and toxicological terminology and behavior.
- 4.1.10 **On Scene Incident Commander**, who will assume control of the incident scene beyond the first responder awareness level, shall receive at least 24 hours of training equal to the first responder operations level and in addition have competency in the following areas:
- Know and be able to implement the employer's incident command system.
 - Know how to implement the employer's emergency response plan.
 - Know and understand the hazards and risks associated with employees working in chemical protective clothing.
 - Know how to implement the local emergency response plan.
 - Know the state emergency response plan and of the Federal Regional Response Team.
 - Know and understand the importance of decontamination procedures.
- 4.1.11 **Skilled Support Personnel** who are skilled in the operation of certain equipment (such as mechanized earth moving or digging equipment or crane and hoisting equipment), who are needed temporarily to perform immediate emergency support work that cannot reasonably be performed in a timely fashion by AECOM's employees, and who will be or may be exposed to the hazards at an emergency response scene are not required to meet the training required. However, these Skilled Support Personnel shall be provided an initial briefing at the site prior to their participation in the emergency response. At a minimum, the initial briefing shall include instruction in the wearing of appropriate PPE, what chemical hazards are involved, and what duties are to be performed. All other appropriate safety and health precautions provided to AECOM's own employees shall also be provided to any Skilled Support Personnel.
- 4.1.12 **Specialist Employees** are AECOM employees who, in the course of their regular job duties, work with and are trained in the hazards of specific hazardous substances and who will be called upon to provide technical advice or assistance at a hazardous substance release incident to the individual in charge shall receive training or demonstrate competency in the area of their specialization annually.
- 4.2 **Emergency Response Plan**
- 4.2.1 An emergency response plan shall be developed and implemented to handle anticipated emergencies prior to performing emergency response operations. The plan shall be in writing and available for inspection and copying by employees, their representatives, and OSHA personnel. The plan shall be reviewed and approved by the Regional SH&E Manager prior to issue.
- 4.2.2 If contract does not require AECOM to provide emergency response services, then AECOM'S SH&E Procedures *S3NA-101-PR Emergency Response Planning, Offices* and *S3NA-203-PR Emergency*

Response Planning, Field shall apply and employees shall evacuate from the danger area whenever an emergency occurs.

4.2.3 Upon completion of the emergency response, all followup remediation work shall be done in accordance with AECOM SH&E Procedure *S3NA-509-PR Hazardous Waste Operations and Emergency Response*.

4.2.4 At a minimum, the emergency response plan shall address the following:

- Pre-emergency planning and coordination with outside parties
- Personnel roles, lines of authority, training, and communication
- Emergency recognition and prevention
- Safe distances and places of refuge
- Site security and control
- Evacuation routes and procedures
- Decontamination
- Emergency medical treatment and first aid
- Emergency alerting and response procedures
- Critique of response and follow-up
- PPE and emergency equipment

4.2.5 (Note: Local and state emergency response plans may need to be review and incorporated into the plan.)

4.3 **Training**

4.3.1 Training for responders shall be provided by AECOM's Regional SH&E Manager or by individuals who have the training and/or academic credentials and instructional experience necessary to demonstrate competent instructional skills and a good command of the subject matter of the courses they are to teach. Employees who receive responder training shall also receive annual refresher training if their responding responsibilities continue.

4.3.2 Employees receiving initial and refresher responder training shall be issued a certificate indicating training competency. Copies of all training records shall be maintained by the Site Safety Officer.

4.4 **Medical Surveillance**

4.4.1 All employees participating in an emergency response shall participate in AECOM'S *S3NA-605-PR Medical Surveillance Program*.

4.5 **Chemical Protective Clothing**

4.5.1 Chemical protective clothing shall be worn in accordance with AECOM'S *S3NA-208-PR Personal Protective Equipment Program*.

4.6 **Spill Response Equipment**

4.6.1 All AECOM offices that store chemicals at their facility shall have the appropriate spill response equipment. Such equipment may include the following:

- Overpack containers of varying capacities
- Absorbent material such as vermiculite or commercially prepared, absorbent containing pillows, rolls, sheets, or booms
- Acid and base neutralizing agents
- Chemically resistant gloves for solvents, alcohols, and acids
- Polycoated Tyvek coveralls
- Safety goggles
- Respiratory protection

4.6.2 Spill response equipment shall be placed adjacent to areas where chemicals are routinely handled, stored, and/or where shipments are received. Similar types of spill response equipment shall also be

available in any AECOM vehicle or rented vehicle in which chemicals are being transported. Access to the spill response equipment shall be designed to avoid likely spill locations.

4.7 Spill Response Equipment for Field Programs

- 4.7.1 The amount of chemicals being used during a field program will dictate the types and quantity of spill response equipment that is brought to the site. If several squirt bottles of decontamination solutions are all that is being brought to a site, a few spill pillows and a one-gallon bucket may be sufficient to respond to a spill of these materials. If gallons of chemicals are being delivered to the site in drums or bulk tanks, a greater variety of spill response equipment will be needed. As indicated previously, during these types of field programs, a separate spill plan will be incorporated into the project health and safety plan (HASP) and will provide a greater level of detail regarding the specific spill response effort for that field program.

4.8 Immediate Response

- 4.8.1 Evacuate all personnel that will not be involved in the clean up from the immediate area of the spill or release.
- 4.8.2 Take all reasonable measures to confine, repair, and remedy the effects of the spill; cleanup must be done by knowledgeable personnel and is in accordance with the product label and MSDS.
- 4.8.3 Use the appropriate equipment and PPE so that you do not expose yourself to any chemicals or hazardous substances.
- 4.8.4 Clean up teams shall be organized outside the spill area and re-enter for cleanup activities.
- 4.8.5 If it is not practicable to maintain the airborne concentration of a flammable gas or vapour below the applicable exposure limit, for example, in a temporary situation or an emergency,
- Only the minimum number of workers necessary for the work may be exposed,
 - Every worker exposed must be adequately trained and equipped to safely perform the required duties,
 - The concentration of the flammable gas or vapor must not exceed 20% of the lower explosive limit (LEL), and
 - In a life-threatening emergency only, exposure of emergency response workers is permitted above 20% of the LEL, provided that only those qualified and properly trained and equipped workers necessary to correct the unsafe condition are exposed to the hazard and every possible effort is made to control the hazard while this is being done.

4.9 First Aid

- 4.9.1 In the event of an incident, refer to the MSDS labels to ensure proper first aid is administered for the hazardous material and call the nearest Poison Centre or 911.
- 4.9.2 The American National Standards Institute (ANSI) Standard for Emergency Eyewash and Shower Equipment (ANSI Z358.1-1998) recommends that the affected body part must be flushed immediately and thoroughly for at least 15 minutes using a large supply of clean fluid under low pressure. However, other references recommend a minimum 20-minute flushing period if the nature of the contaminant is not known. The flushing or rinsing time can be modified if the identity and properties of the chemical are known. For example, at least
- 5 minutes flushing time for mild irritants.
 - 20 minutes for moderate to severe irritants.
 - 20 minutes for nonpenetrating corrosives.
 - 60 minutes for penetrating corrosives.
 - If irritation persists, repeat the flushing procedure.
- 4.9.3 It is important to note that ingestion of any chemical is not likely to occur in the workplace. If ingestion does occur, evidence indicates that inducing vomiting is not necessary in most situations where there has been an occupational chemical ingestion. Induction of vomiting should only be recommended if the chemical has very high, short-term (acute) toxicity, and medical follow-up is not readily available. In these cases, first aiders should receive special training on how to safely and effectively induce vomiting in the appropriate circumstances.
- 4.9.4 In the unlikely event that there is an on-site release of a hazardous substance (e.g., H₂S):

- Get out of the area (in an upwind direction).
- Sound an alarm.
- Assess situation.
- Put on a breathing apparatus.
- Rescue victim(s).
- Revive victim(s).
- Get medical aid.

4.10 Reporting

- 4.10.1 Should there be a spill or leak involving a hazardous product, employees shall immediately notify the Supervisor and SH&E Incident Reporting Line.
- 4.10.2 "Dangerous occurrences" must be reported immediately to the police, employer, vehicle owner/lesser and the dangerous goods owner. Such events would include spills, bulk container damage, fire, explosion, and transportation accidents involving dangerous goods.
- 4.10.3 Confirm and seek direction on external reporting requirements.
- A major release of a hazardous substance must be reported to the appropriate provincial or territorial governing body for Occupational Health and Safety.
 - All spills and releases must be reported to the governing regulatory body. Each jurisdiction has regulations governing the minimum quantities for reporting based on the type of product spilled or released.
- 4.10.4 If you have knowledge of spill, release, or unlawful discharge, notify authorities immediately. Reporting does not imply guilt or assign blame. You will need to report the following details.
- Location and time of spill.
 - Description of circumstances leading to spill.
 - Type and quantity of material or substance spilled.
 - Details of any action taken at the site of the spill.
 - Description of location of spill and immediately surrounding the area.
 - Any additional information in respect of the spill that the Minister, environmental protection officer or person designated by regulations requires.

Material Safety Data Sheets

Wastewater Treatment Plant

	Reagent	Delivery details	Supplier	Quantity required for treatment duration	Storage specifications	Containment area specifications
AECOM	93% Sulfuric Acid	Tanker	ChemTreat, Inc.	2,500 gal	2,500 gal bulk storage tanks in well ventilated area	yes
	50% Sodium Hydroxide	Tanker	ChemTreat, Inc.	2,500 gal	2,500 gal Store in cool, dry, well ventilated area	yes
	Sodium Bisulfate	Tanker	ChemTreat, Inc.	4,200 gal	4,200 gal Avoid freezing	yes
	Aluminum Chlorohydrate	Tanker	ChemTreat, Inc.	3,500 gal	3,500 gal Protect from heat and sources of ignition	yes

	MSDS Instructions			
	Storage & Handling	Spill	Incompatible Materials	Source
93% Sulfuric Acid	Keep container tightly closed. Keep container in a cool, well-ventilated area. Do not store above 23°C (73.4°F). Protect against physical damage and water. Wear full protective rubber clothing and rubber gloves and boots, acid hood, and full face shield when loading or unloading tank trucks or railway cars.	Treat with extreme caution. Zone off contaminated area. Dike area with sand or earth. Acid may be neutralized with soda ash or lime. Neutralization or dilution of strong Sulfuric Acid will ALWAYS be accompanied by a very strong chemical reaction with release of heat and possible splattering of the acid. Organic or combustible materials such as sawdust or rags should never be used to soak up spills. Wear full protective clothing (acid protective slicker suit).	Water and most common metals, organic materials, carbides, chlorates, fulminates, nitrates, picrates, powdered metals, other combustible materials and strong oxidizing agents. Attacks many metals, releasing hydrogen. Acetic acid, acetone cyanohydrin, acetone and nitric acid and styrene monomer, vinyl acetate, nitric acid and toluene.	ChemTreat, Inc.
50% Sodium Hydroxide	Store in a cool, dry, well-ventilated area. Keep containers tightly closed when not in use and when empty. Protect from damage. Use corrosion-resistant structural materials and lighting and ventilation systems in the storage area. Containers made of nickel alloys are preferred. Steel containers are acceptable if temperatures are not elevated. Plastics or plastic-lined steel, or FRP tanks of Derakane vinyl ester resin may be suitable. Container contents may develop pressure after prolonged storage. Drums may need to be vented. Only trained personnel should perform venting.	Restrict access to area until completion of clean up. Ensure trained personnel conduct clean up. Ventilate area. Wear adequate personal protective equipment. Do not touch spilled material. Prevent entry into sewers or waterways. Land spill of sodium hydroxide: Solutions should be contained by diking with inert material, such as sand or earth. Solutions can be recovered or carefully diluted with water and cautiously neutralized with acids such as acetic acid or hydrochloric acid.	Sodium hydroxide reacts vigorously, violently or explosively with many organic and inorganic chemicals, such as strong acids, nitroaromatic, nitroparaffin and organohalogen compounds, glycols and organic peroxides. Reacts violently with water generating significant heat. Violently polymerizes acetaldehyde, acrolein or acrylonitrile. Produces flammable and explosive hydrogen gas if it reacts with sodium tetrahydroborate or certain metals. Can form spontaneously flammable chemicals upon contact with 1,2-dichloroethylene, trichloroethylene or tetrachloroethane. Can produce carbon monoxide upon contact with solutions of sugars.	ChemTreat, Inc.
Sodium Bisulfate	Store at ambient temperatures. Keep container securely closed when not in use. Label precautions also apply to empty container. Recondition or dispose of empty containers in accordance with government regulations. For Industrial use only. Do not store below 30°F. Wear appropriate Personal Protective Equipment (PPE) when handling this product. Do not get in eyes, or on skin and clothing. Wash thoroughly after handling. Do not ingest. Avoid breathing vapors, mist or dust.	Contain and recover liquid when possible. Flush spill area with water spray.	Strong oxidizers, Strong bases, Strong acids	ChemTreat, Inc.
Aluminum Chlorohydrate	Store at ambient temperatures. Keep container securely closed when not in use. Label precautions also apply to empty container. Recondition or dispose of empty containers in accordance with government regulations. For Industrial use only. Protect from heat and sources of ignition. Store in corrosive resistant container with a resistant liner.	Contain and recover liquid when possible. Flush spill area with water spray.	Strong oxidizers, Strong bases	ChemTreat, Inc.

Material Safety Data Sheet

J. R. Simplot Company

AgriBusiness

Trade Name: Sulfuric Acid 93%
Registration No: None

M16020

SECTION 1 CHEMICAL PRODUCT AND COMPANY INFORMATION

Manufacturer or Formulator: J.R. Simplot Company P.O. Box 70013 Boise, ID 83707 Emergency Phone - Chemtrec: 1-800-424-9300	Product Name: Sulfuric Acid 93% Common Name: Sulfuric Acid 93% Chemical Type: Inorganic Acid
---	---

SECTION 2 COMPOSITION INFORMATION

Chemical Name and Synonyms	C.A.S. No.	Chemical Formula	WT% Hazardous	TLV	PEL
Sulfuric Acid	7664-93-9	H ₂ SO ₄	93% Non Hazardous	0.2 mg/m ³	1 mg/m ³ 8Hr TWA
Water	7732-18-5	H ₂ O	7%	Not Listed	Not Listed

SECTION 3 HAZARDS IDENTIFICATION

Ingestion: Moderately toxic. Corrosive to the mouth, throat and stomach. May cause gastrointestinal disturbances. Symptoms may include salivation, irritation, throat burns, nausea, abdominal pains, vomiting and diarrhea.

Inhalation: Highly toxic. May cause respiratory tract irritation, throat burns, constriction of the windpipe, severe pulmonary edema and death. May also cause inflammation of the stomach, bronchitis, and tooth erosion. Exposure may cause symptoms similar to those listed under "Ingestion."

Eye Contact: Extremely irritating and corrosive. Direct contact may cause conjunctivitis, corneal ulceration and permanent injury.

Skin Absorption: May destroy the epidermis and penetrate some distance into the skin and subcutaneous tissues and cause necrosis. Ulceration of the skin.

Skin Contact: May cause irritation or burns on skin. Prolonged contact may cause severe, deep burns to tissue; very corrosive effects. May cause dermatitis, ulceration. Burns may not become symptomatic for several hours after contact..

Effects of Overdose: **LOCAL:** Conjunctivitis, corneal necrosis, dermatitis, skin burns, ulceration. **RESPIRATORY:** Irritation of the nose and throat, laryngeal edema, bronchitis, pneumonia, pulmonary edema. **GASTROINTESTINAL:** Dental erosion, shock, anuria, burning in mouth, throat and abdomen; nausea, vomiting of blood and eroded tissue, perforation of gastrointestinal tract, albumin, blood and casts in urine.

SECTION 4 FIRST AID MEASURES

Emergency and First Aid Procedures: Treatment is symptomatic and no specific antidotes are known.

Ingestion: Rinse mouth with large amounts of water, DO NOT INDUCE VOMITING. If patient is conscious give milk mixed with egg whites or as much water as possible

Inhalation: Remove person from exposure area to fresh air and support breathing.

Eyes: IMMEDIATELY flush eyes with fresh running water for 15-20 minutes.

Skin: Give continuous flow of water to wash material off body. Remove contaminated clothing (under a shower if possible) and subject patient to deluge-type shower, if possible. Treat for shock. Prompt medical consultation is essential.

SECTION 5 FIRE FIGHTING MEASURES

Extinguishing Media: Fires involving small amounts of combustibles may be smothered with suitable dry chemicals. Use water on combustibles in vicinity of this material but use care, as water applied directly to their acid results in evolution of heat, causes splattering, and can further disperse aerosols.

Special Fire Fighting Procedures: Avoid any contact with acid. Wear full protective rubber clothing, gloves, boots, wear self-contained breathing apparatus.

Unusual Fire and Explosion Hazards: Not flammable but highly reactive and can cause ignition by contact with combustible materials. Reacts violently with water and organics. May release explosive hydrogen gas inside storage tanks, drums, tank cars, and tank trucks. This is a very powerful acidic oxidizer which can ignite or even explode on contact with many materials; i.e., acetic acid, acetone cyanhydrin, (acetone + HNO₃), (acetone + K₂Cr₂O₇), acetonitrile, acrolein, acrylonitrile, (acrylonitrile + H₂O), (alcohols + H₂O₂), allyl alcohol, allyl chloride, NH₄OH, 2-amino ethanol, NH₄tripperchromate, aniline, (bromates + metals, BrF₅, n-butylaldehyde, carbides, CoHC₂, chlorates, (metals + chlorates), ClF₃, chlorosulfonic acid, Cu₃N, diisobutylene, (dimethyl benzylcarbinol + H₂O₂), epichlorohydrin, ethylene cyanhydrin, ethylene diamine, ethylene glycol, ethylene imine, fulminates, HCl, H₂, IF₇ (indene + HNO₃ + glycerides, p-nitroluene, perchlorates, HClO₄, (C₆H₆ + permanganates), pentasilver trihydroxydiamino phosphate, (l-phenyl-2-methyl propyl alcohol + H₂O₂), P, P(OCN)₃, picrates, potassium-tert-butoxide, KClO₃, KMnO₄, (KMnO₄ + KCl), KMnO₄ + H₂O) beta-propiolactone, RbHC₂, propylene oxide, pyridine, NA, Na₂CO₃, NaOH, steel, styrene monomer, water, vinyl acetate, (HNO₃ + toluene).

SECTION 6 ACCIDENTAL RELEASE MEASURES

Environmental Precautions: No information available; however, Sulfuric Acid has a reportable quantity of 1000 lbs. and, in the event of an accidental release, should be kept out of all watercourses and bodies of water. Do not contaminate any watercourse or body of water by direct application, cleaning of equipment or disposal.

Steps to be taken in case material is released or spilled: Treat with extreme caution. Zone off contaminated area. Dike area with sand or earth. Acid may be neutralized with soda ash or lime. Neutralization or dilution of strong Sulfuric Acid will **ALWAYS** be accompanied by a very strong chemical reaction with release of heat and possible splattering of the acid. Organic or combustible materials such as sawdust or rags should never be used to soak up spills. Wear full protective clothing (acid protective slicker suit).

Trade Name: Sulfuric Acid 93%
Registration No: None

M16020

SECTION 7

HANDLING AND STORAGE

Precautions to be taken in handling and storing:

When diluting always add acid to water slowly, never the reverse. Protect against physical damage and water. Wear full protective rubber clothing and rubber gloves and boots, acid hood, and full face shield when loading or unloading tank trucks or railway cars. If exposure is low, acid gas canister may be satisfactory or a self-contained breathing apparatus in the pressure demand mode or a supplied air respirator. Consult the respirator manufacturer to determine the appropriate type of equipment for a given application. In any event always wear eye protection.

SECTION 8

EXPOSURE CONTROLS/PERSONAL PROTECTION

- Ventilation Protection:** Maintain adequate ventilation at all locations where acid is handled. Store in the open or in well ventilated buildings or sheds.
- Respiratory Protection:** Depends on type of exposure, can range from none to full protection. Self-contained breathing apparatus, or positive pressure hose mask, or air-line supplied with clean compressed air. Check with respirator manufacturer to determine the appropriate type of equipment for a given application.
- Protective Clothing:** When loading or unloading trucks or cleaning out tanks or towers, wear acid resistant slicker suit, rubber clothing with rubber hood or broad soft hat, rubber apron, rubber gloves, rubber boots, and full face shield.
- Suit Material Performance:** (suggested by E.P.A.--user should determine by specific use)
- | | |
|---------------------|-----------|
| Butyl..... | Poor |
| Butyl/Neoprene..... | Good |
| CPE | Excellent |
| Chlorobutyl..... | Good |
| Neoprene | Good |
- Eye Protection:** Chemical splash-proof goggles and/or full face shield.
- Other:** Safety shower and eyewash fountain checked daily in area.

SECTION 9

PHYSICAL AND CHEMICAL PROPERTIES

- | | | | |
|-----------------------------|---|---------------------------------|-----------------------|
| Boiling Point: | 530°F | Solubility in Water: | Complete (Exothermic) |
| Specific Gravity: | 1.84 @ 60°F | % Volatiles (by volume): | 100% @ 644°F |
| pH: | Less than 1.0 | Vapor Pressure, mm Hg: | 1 @ 294°F |
| Appearance: | Clear, colorless to cloudy | Melting Point: | -31° to 51°F |
| Extinguishing Media: | Use media suitable to extinguish source of fire. | Reaction with Water: | VIOLENT |
| Flashpoint: | Non-flammable. It may cause ignition on contact with combustible liquids or solids. | | |

SECTION 10

STABILITY AND REACTIVITY

- Stability (Normal Conditions):** Stable
- Conditions to Avoid:** High temperature, organic materials, powdered metals, and other combustible materials.
- Incompatibility (Material to Avoid):** Water and most common metals, organic materials, carbides, chlorates, fulminates, nitrates, picrates, powdered metals, other combustible materials and strong oxidizing agents. Attacks many metals, releasing hydrogen. Acetic acid, acetone cyanohydrin, acetone and nitric acid and styrene monomer, vinyl acetate, nitric acid and toluene.
- Hazardous Decomposition Products:** Hydrogen gas and hazardous fumes of SO_x
- Hazardous Polymerization:** Will not occur

SECTION 11

TOXICOLOGY

- Acute Oral Toxicity:** LD₅₀ (rat) is greater than 5,000 mg/kg (ppm); not acutely toxic by oral exposure. (TFI Product Testing Results, OECD Guideline 425)
- Acute Inhalation Toxicity:** LC₅₀ (rat, guinea pig) is 18-420 mg/m³; highly toxic by inhalation. (TFI Product Testing Results)
- Acute Aquatic Toxicity:** Fish 96-hour LC₅₀ is 42-500 mg/L (ppm); daphnia 24-hour EC₅₀: 29-88 mg/L; algae 10 mg/L. Slightly toxic to aquatic organisms. (TFI Product Testing Results)

SECTION 12

ECOLOGICAL INFORMATION

None Listed.

SECTION 13

DISPOSAL CONSIDERATIONS

- Waste Disposal Procedures:** If possible, avoid pouring or spraying water directly onto strong Sulfuric Acid. This **ALWAYS** results in a violent chemical reaction. It is always best to slowly pour the acid into water during disposal operations to avoid the violent reaction and splattering of acid. If water must be sprayed into the acid for dilution, flushing, etc., it should always be done from a distance with proper protective gear.

Disclaimer: This information relates to the specific material designated and may not be valid for such material used in combination with any other materials or in any process. Such information is to the best of our knowledge and belief, accurate and reliable as of the date compiled. However, no representation, warranty or guarantee is made as to its accuracy, reliability or completeness. **NO WARRANTY OF MERCHANTABILITY, FITNESS FOR ANY PARTICULAR PURPOSE, OR ANY OTHER WARRANTY, EXPRESS OR IMPLIED, IS MADE CONCERNING THE INFORMATION HEREIN PROVIDED.** It is the user's responsibility to satisfy himself as to the suitability and completeness of such information for his own particular use. We do not accept liability for any loss or damage that may occur from the use of this information nor do we offer warranty against patent infringement.

Trade Name: Sulfuric Acid 93%
Registration No: None

M16020

SECTION 14

TRANSPORT INFORMATION

Shipping name:	RQ Sulfuric Acid (with more than 51 percent acid), 8, UN1830 P.G. II	C.A.S. Number:	7664-93-9
Hazard Class:	8	Sub. Hazard Class:	None
Reportable Quantity (RQ):	1000 lbs. - Sulfuric Acid	D.O.T. Number:	UN1830
Packing Group	II	Labels Required:	Corrosive
EPA Regist No:	None	Placard:	Corrosive
Haz Waste No:	D002		

Refer to 49 CFR 172.101 Hazardous Materials Table for further provisions, packaging authorizations and quantity limitations.

SECTION 15

REGULATORY INFORMATION

Carcinogenicity: by IARC? Yes () No (X) by NTP? Yes () No (X)
IARC evaluates occupational exposures to strong, inorganic-acid mists containing Sulfuric Acid in "Group 1", as having carcinogenic potential. However, SULFURIC ACID ITSELF WAS NOT CLASSIFIED AS A GROUP I CARCINOGEN.

This product contains sulfuric acid, CAS No. 7664-93-9, which is subject to the reporting requirements of section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 and 40 CFR Part 372.

SECTION 16

OTHER INFORMATION

Flash Point (Test Method):	Not applicable	Flammable Limits	LOWER	UPPER
Autoignition Temperature:	Not applicable	(% BY VOLUME)	N/A	N/A
Hazard Rating (N.F.P.A.):	Health: 3	Fire: 0	Reactivity: 2	Specific: Use no water

This N.F.P.A. rating is a recommendation by the manufacturer using the guidelines or published evaluations prepared by the National Fire Protection Association (N.F.P.A.).

FIREFIGHTING TECHNIQUE

Concentrated vapors of Sulfuric Acid are extremely irritating to the respiratory tract and may cause breathing difficulty. Prevent human exposure to fire, smoke, fumes, or products of combustion. Evacuate nonessential personnel from the fire area. Maintain a safe distance from the fire and storage area because excessive heat may cause tank to rupture. Wear full face, self-contained breathing apparatus and impervious clothing (such as gloves, hood, suits, and rubber boots). Use water spray, dry chemical, foam, carbon dioxide, or halogenated extinguishing agents. If the tank is not leaking, keep cooled using a fog spray nozzle to minimize the reactivity of the water and acid. Under no circumstance should water or other liquid be introduced into acid tanks. Take care not to ignite hydrogen gas which can accumulate inside metal tanks containing acid.

SPECIAL HANDLING

Make sure all personnel involved in the spill cleanup follow good industrial hygiene practices.

A small spill can be handled routinely. Use adequate ventilation or wear an air-supplied respirator to prevent inhalation contact. Wear suitable protective clothing to prevent skin and eye contact. Use the following procedures:

- Any leak occurring in pipelines or equipment should be considered an acid leak and treated with extreme caution until the leak is proven not to be an acid leak.
- All contaminated areas should be immediately zoned off to avoid personnel exposure to the acid spray or stream.
- Adjust all appropriate valves to isolate the system and stop further leakage.
- Soda ash or lime should be spread around to neutralize any remaining acidity on the surface of the ground or concrete pad. The contaminated area should be covered with sand or gravel, and acidity neutralized with soda ash or lime.
- Sulfuric Acid leaks, spills or drainings must not come in contact with any acid soluble sulfide wastes (such as in sewers), because of danger of evolving hydrogen sulfide gas.

Large spills should be handled according to the predetermined plan. Part of this plan should include Section V, FIRE FIGHTING MEASURES.

CORROSIVITY TO MATERIALS OF CONSTRUCTION

Weaker strengths of Sulfuric Acid, particularly concentrations below 60° Baume, are highly corrosive to most metals with evolution of hydrogen gas.

STORAGE REQUIREMENTS

The following safety facilities should be readily accessible in all areas where Sulfuric Acid is handled or stored.

SAFETY SHOWERS--with quick opening valves which stay open. Water should be supplied through insulated lines to prevent freeze-ups in cold weather.

EYEWASH FOUNTAIN--or other means of washing the eyes with a gentle flow of tap water.

Sulfuric Acid may be safely stored in properly designed bulk storage tanks.

DISPOSAL OF UNUSED MATERIAL

Sulfuric Acid that cannot be used or chemically reprocessed should be disposed of in such a manner that will not adversely affect the environment.

MSDS Version Number: 8 (revision to Section 3)

Sodium Hydroxide Solution, 50%

SECTION 1 – CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

Δ

Manufacturer's name and address:

Olin Corporation – Chlor Alkali Products
Division

CLEVELAND, TN OFFICE

490 Stuart Road NE
Cleveland, TN 37312-4918
U.S. • (423) 336-4850

Supplier's name and address:

Olin Canada, ULC d/b/a
Olin Chlor Alkali Products

MONTREAL, QC OFFICE

2020 University, Suite 2190
Montreal, Quebec H3A 2A5
Canada • (514) 397-6100

Product Name: Sodium Hydroxide Solution, 50%

CAS#: 1310-73-2

MSDS Code: NaOH(50)-E

Preparation date (M/D/Y): 10/02/08

Revision date (M/D/Y): 02/08/11

Synonyms: Caustic soda liquid 50%, Soda lye, Lye, Liquid Caustic, Sodium Hydrate

Product Use: Neutralizing agent, industrial cleaner, pulping and bleaching, soap manufacturing

Emergency Contacts (24 hr.)

FOR INFORMATION REGARDING ON SITE CHEMICAL EMERGENCIES INVOLVING A SPILL OR LEAK, CALL

Δ

Canada: 1-800-567-7455

U.S.: 1-800-424-9300 – CHEMTREC

SECTION 2 – COMPOSITION / INFORMATION ON INGREDIENTS

Δ

Hazardous Ingredient(s)	% (w/w)	ACGIH	CAS NO.
Sodium Hydroxide	49 – 52	2 mg/m ³ (TLV-C)	1310-73-2

SECTION 3 – HAZARD IDENTIFICATION

Emergency Overview: Odorless, clear, non-volatile liquid. EXTREMELY CORROSIVE! Causes severe burns on contact. Can cause blindness, permanent scarring and death. Aerosols can cause lung injury – effects may be delayed. Highly reactive. Can react violently with water and numerous commonly encountered materials, generating enough heat to ignite nearby combustible materials. Contact with many organic and inorganic chemicals may cause fire or explosion. Reacts with some metals to liberate hydrogen gas, which can form explosive mixtures with air. Will not burn. Harmful to aquatic life. Read the entire MSDS for a more thorough evaluation of the hazards.

Potential Health Effects:

Δ

Routes of exposure: Inhalation, skin contact, eye contact and ingestion.

SODIUM HYDROXIDE SOLUTION, 50%

Update/Review: February 8, 2011

Page 2 of 10

Inhalation: Sodium hydroxide does not readily form a vapor and inhalation exposure is likely to occur as an aerosol. Due to its corrosive nature, sodium hydroxide aerosols could cause pulmonary edema (severe, life-threatening lung injury). The development of pulmonary edema may be delayed up to 48 hours after exposure. The early symptoms of pulmonary edema include shortness of breath and tightness in the chest.

Skin Contact: EXTREMELY CORROSIVE! Sodium hydroxide is capable of causing severe burns with deep ulceration and permanent scarring. It can penetrate to deeper layers of skin and corrosion will continue until removed. The severity of injury depends on the concentration (solutions) and the duration of exposure. Burns may not be immediately painful; onset of pain may be delayed minutes to hours. Several human studies and case reports describe the corrosive effects of sodium hydroxide. A 4% solution of sodium hydroxide, applied to a volunteer's arm for 15 to 180 minutes, caused damage which progressed from destruction of cells of the hard outer layer of the skin within 15 minutes to total destruction of all layers of the skin in 60 minutes. Solutions as weak as 0.12% have damaged healthy skin within 1 hour.

Eye Contact: EXTREMELY CORROSIVE! The severity of injury increases with the concentration, the duration of exposure, and the speed of penetration into the eye. Damage can range from severe irritation and mild scarring to blistering, disintegration, ulceration, severe scarring and clouding. Conditions, which affect vision such as glaucoma and cataracts, are possible late developments. In severe cases, there is progressive ulceration and clouding of eye tissue which may lead to permanent blindness.

Ingestion: EXTREMELY CORROSIVE! Severe pain; burning of the mouth, throat and esophagus; vomiting; diarrhea; collapse and possible death may result.

Chronic Effects: SKIN: Repeated or prolonged skin contact would be expected to cause drying, cracking, and inflammation of the skin (dermatitis).

Existing Medical Conditions Possibly Aggravated by Exposure: Asthma, bronchitis, emphysema and other lung diseases and chronic nose, sinus or throat conditions. Skin irritation may be aggravated in individuals with existing skin disorders.

Carcinogenicity: Sodium hydroxide is not classified as a carcinogen by ACGIH (American Conference of Governmental Industrial Hygienists) or IARC (International Agency for Research on Cancer), not regulated as a carcinogen by OSHA (Occupational Safety and Health Administration), and not listed as a carcinogen by NTP (National Toxicology Program).

△ **Other important hazards:** Refer to TOXICOLOGICAL INFORMATION (Section 11) for additional information.

SECTION 4 – FIRST AID MEASURES

General: If you feel unwell, IMMEDIATELY seek medical advice (show this document).

Inhalation: Move victim to fresh air. If breathing is difficult, oxygen may be beneficial if administered by trained personnel, preferably on a doctor's advice. Give artificial respiration ONLY if breathing has stopped. Do not use mouth-to-mouth method if victim ingested or inhaled the substance: induce artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Give Cardiopulmonary Resuscitation (CPR) only if there is no pulse AND no breathing. Obtain medical attention IMMEDIATELY. Symptoms of pulmonary edema can be delayed up to 48 hours after exposure.

Skin Contact: Immediately flush skin with lukewarm water for at least 20 minutes, and up to 60 minutes if necessary. Under lukewarm water remove contaminated clothing, jewelry, and shoes. If irritation persists, repeat flushing. Obtain medical attention immediately. Discard contaminated clothing and shoes in a manner which limits further exposure.

SODIUM HYDROXIDE SOLUTION, 50%

Update/Review: February 8, 2011

Page 3 of 10

Eye Contact: Immediately flush eyes with lukewarm water for at least 20 minutes, and up to 60 minutes if necessary. Hold eyelids open during flushing. If irritation persists, repeat flushing. Obtain medical attention IMMEDIATELY. Do not transport victim until the recommended flushing period is completed unless flushing can be continued during transport.

Ingestion: DO NOT INDUCE VOMITING. If victim is alert and not convulsing, rinse mouth and give as much water as possible to dilute material (8 to 10 oz. or 240 to 300 mL). If spontaneous vomiting occurs, have victim lean forward with head down, rinse mouth and administer more water. IMMEDIATELY transport victim to an emergency facility.

SECTION 5 – FIRE FIGHTING MEASURES

Flammability	Not applicable. Not combustible (does not burn).
Flash Point (method)	Not applicable.
Flammable Limits (Lower)	Not applicable
Flammable Limits (Upper)	Not applicable
Auto Ignition Temperature	Not applicable
Combustion and Thermal Decomposition Products	Sodium oxide fumes
Rate of Burning	Not applicable
Explosive Power	Not applicable
Sensitivity to Mechanical Impact	Not sensitive ; stable material
Sensitivity to Static Charge	Not applicable

Fire and Explosion Hazards: Sodium hydroxide will not burn or support combustion. The reaction of sodium hydroxide with water and a number of commonly encountered materials (see Section 10) can generate sufficient heat to ignite nearby combustible materials. Sodium hydroxide can react with metals, such as aluminum, tin and zinc, to form flammable hydrogen gas.

Extinguishing Media: Use extinguishing media suitable for the surrounding fire. If water is used, care should be taken, since it can generate heat and cause spattering if applied directly to sodium hydroxide.

Special Information: Evacuate area and fight fire from a safe distance or a protected location. Approach fire from upwind. If possible, isolate materials not involved in the fire and protect personnel. Move containers from fire area if it can be done without risk.

Water can be used with extreme caution to extinguish a fire in an area where sodium hydroxide is stored. The water must not come into contact with the sodium hydroxide. Water can be used in flooding quantities as a spray or fog to keep fire-exposed containers cool and absorb heat. At high temperatures, fuming may occur, giving off a strong, corrosive gas. Do not enter without wearing specialized protective equipment suitable for the situation.

Evacuation: If tank or tank truck involved in a fire, ISOLATE and consider evacuation of one-half (1/2) mile (800 meters) in all directions.

Fire Fighting Protective Equipment: Firefighter's normal protective clothing (Bunker Gear) will not provide adequate protection. Chemical resistant clothing (e.g. chemical splash suit) and positive pressure self-contained breathing apparatus (MSHA/NIOSH approved or equivalent) may be necessary.

NOTE: Also see "Section 10 - Stability and Reactivity"

SODIUM HYDROXIDE SOLUTION, 50%

Update/Review: February 8, 2011

Page 4 of 10

SECTION 6 – ACCIDENTAL RELEASE MEASURES

Spills, Leaks, or Releases:

- Restrict access to area until completion of clean up. Ensure trained personnel conduct clean up. Ventilate area.
- Wear adequate personal protective equipment (See Section 8). Do not touch spilled material.
- Prevent entry into sewers or waterways.
- Land spill of sodium hydroxide: Solutions should be contained by diking with inert material, such as sand or earth. Solutions can be recovered or carefully diluted with water and cautiously neutralized with acids such as acetic acid or hydrochloric acid.
- Water spill: Neutralize with dilute acid.
- Comply with Federal, Provincial/State and local regulations on reporting releases.

Deactivating Chemicals: Weak acid solutions (acetic, hydrochloric or sulfuric acid).

Waste Disposal Methods: Dispose of waste material at an approved waste treatment/disposal facility, in accordance with applicable regulations. Do not dispose of waste with normal garbage or to sewer systems.

Note

- Clean-up material may be a RCRA Hazardous Waste on disposal.
- Spills are subject to CERCLA reporting requirements: RQ = 1000 lbs. (454 kg).

SECTION 7 – HANDLING AND STORAGE

Precautions: EXTREMELY CORROSIVE! Have emergency equipment (for fires, spills, leaks, etc.) readily available. Ensure all containers are labeled. Wear appropriate Personal Protection Equipment (*Refer to Section 8*). People working with this chemical should be properly trained regarding its hazards and its safe use.

Handling Procedures and Equipment: Use smallest possible amounts in designated areas with adequate ventilation. Keep containers closed when not in use. Empty containers may contain hazardous residues. Avoid generating mists. Transfer solutions using equipment, which is corrosion-resistant. Cautiously, transfer into sturdy containers made of compatible materials. Never return contaminated material to its original container. Considerable heat is generated when diluted with water. Proper handling procedures must be followed to prevent vigorous boiling, splattering or violent eruption of the diluted solution. Never add water to a sodium hydroxide solution. **ALWAYS ADD SODIUM HYDROXIDE TO WATER** and provide agitation. When mixing with water, stir small amounts in slowly. Use cold water to prevent excessive heat generation.

Storage Requirements: Store in a cool, dry, well-ventilated area. Keep containers tightly closed when not in use and when empty. Protect from damage. Store away from incompatible materials such as strong acids, nitroaromatic, nitroparaffinic or organohalogen compounds. See Section 10 for Incompatibles. Use corrosion-resistant structural materials and lighting and ventilation systems in the storage area. Containers made of nickel alloys are preferred. Steel containers are acceptable if temperatures are not elevated. Nickel is the preferred metal for handling this product. Plastics or plastic-lined steel, or FRP tanks of Derakane vinyl ester resin may be suitable. Container contents may develop pressure after prolonged storage. Drums may need to be vented. Trained personnel should only perform venting.

Storage Temperature: Avoid freezing. Do not expose sealed containers to temperatures above 40°C (104°F).

SODIUM HYDROXIDE SOLUTION, 50%

Update/Review: February 8, 2011

Page 5 of 10

SECTION 8 – EXPOSURE CONTROLS / PERSONAL PROTECTION

PREVENTIVE MEASURES

Recommendations listed in this section indicate the type of equipment which will provide protection against over exposure to this product. Conditions of use, adequacy of engineering or other control measures, and actual exposures will dictate the need for specific protective devices at your workplace.

Engineering Controls: Local exhaust ventilation should be applied wherever there is an incidence of point source emissions or dispersion of regulated contaminants in the work area. Ventilation control of the contaminant as close to its point of generation is both the most economical and safest method to minimize personnel exposure to airborne contaminants. The most effective measures are the total enclosure of processes and the mechanization of handling procedures to prevent all personal contact.

PERSONAL PROTECTIVE EQUIPMENT

Maintain eye wash fountain and quick-drench facilities in work area. Detailed requirements for personal protective equipment should be established on a site-specific basis.

Eye Protection: Wear full face-shield and chemical safety goggles when there is potential for contact.

Skin Protection: Wear appropriate personal protective clothing to prevent skin contact.

Guidelines for sodium hydroxide solutions, 30-70%:

RECOMMENDED (resistance to breakthrough longer than 8 hours): Butyl rubber; natural rubber, neoprene rubber, nitrile rubber, polyethylene, polyvinyl chloride, Teflon™, Viton™, Saranex™, 4H™, Barricade™, CPF 3™, Responder™, Trelchem HPS™, Tychem 10000™.

NOT RECOMMENDED for use (resistance to breakthrough less than 1 hour): Polyvinyl alcohol.

Respiratory Protection:

Up to 10 mg/m³: Supplied Air Respirator (SAR) operated in a continuous-flow mode, eye protection needed; or full face-piece respirator with high-efficiency particulate filter(s); or powered air-purifying respirator with dust and mist filter(s), eye protection needed; or full face-piece Self-Contained Breathing Apparatus (SCBA); or full face-piece SAR.

Emergency or Planned Entry into Unknown Concentrations or IDLH Conditions: Positive pressure, full face-piece SAR; or positive pressure, full face-piece SAR with an auxiliary positive pressure SAR.

ESCAPE: Full face-piece respirator with high-efficiency particulate filter(s); or escape-type SCBA.

EXPOSURE GUIDELINES

PRODUCT: Sodium hydroxide:

Δ	ACGIH Ceiling Exposure Limit (TLV-C)	2 mg/m ³
	OSHA PEL-TWA	2 mg/m ³
	NIOSH IDLH	10 mg/m ³
	NIOSH REL:	C 2 mg/m ³

SODIUM HYDROXIDE SOLUTION, 50%

Update/Review: February 8, 2011

Page 6 of 10

SECTION 9 – PHYSICAL AND CHEMICAL PROPERTIES

Alternate Name(s)	Caustic soda liquid 50%, Soda lye, Lye, Liquid Caustic, Sodium Hydrate
Chemical Name	Sodium hydroxide
Chemical Family	Alkali hydroxide
Molecular Formula	NaOH
Molecular Weight	40.01
Physical State and Appearance	Clear-to-slightly turbid liquid
Odor	Odorless
pH	14.0 (Aqueous solution: 5%)
Vapor Pressure	0.2 kPa (1.5 mm Hg) at 20 °C (68°F) (50% solution)
Vapor Density (Air = 1)	Not applicable
Boiling Point	140 °C (284 °F) (50% solution)
Freezing Point	12 °C (53.6 °F) (50% solution)
Solubility (Water)	Soluble in all proportions
Specific Gravity	1.53 (50% solution) 15.5 °C (60°F)
Evaporation Rate	Not applicable
Viscosity (cp):	78.3 at 20 °C (68°F)
Bulk Density (lbs/cu ft):	95.5
Coefficient of Oil/Water Distribution	Essentially zero

SECTION 10 – STABILITY AND REACTIVITY

Chemical Stability: Stable at room temperature.

Hazardous Decomposition Products: Thermal decomposition: sodium oxide fumes

Conditions to Avoid: Water. Keep away from incompatibles.

Incompatibility with other Substances: Sodium hydroxide reacts vigorously, violently or explosively with many organic and inorganic chemicals, such as strong acids, nitroaromatic, nitroparaffin and organohalogen compounds, glycols and organic peroxides. Reacts violently with water generating significant heat and dangerously spattering corrosive sodium hydroxide. Violently polymerizes acetaldehyde, acrolein or acrylonitrile. Produces flammable and explosive hydrogen gas if it reacts with sodium tetrahydroborate or certain metals such as aluminum, tin, or zinc. Can form spontaneously flammable chemicals upon contact with 1,2- dichloroethylene, trichloroethylene or tetrachloroethane. Can produce carbon monoxide upon contact with solutions of sugars, such as fructose, lactose and maltose.

Corrosivity to Metals: Corrosive to aluminum, tin, zinc, copper, and most alloys in which they are present including brass and bronze. Corrosive to steel at elevated temperatures above 40°C(104°F).

Stability and Reactivity Comments: Slowly attacks glass at room temperature.

Hazardous Polymerization: Will not occur. However, it can induce hazardous polymerization of acetaldehyde, acrolein, and acrylonitrile.

SODIUM HYDROXIDE SOLUTION, 50%

Update/Review: February 8, 2011

Page 7 of 10

SECTION 11 – TOXICOLOGICAL INFORMATION

For more toxicological information, refer to Section 3.

TOXICOLOGICAL DATA:

Toxicological Data: Sodium hydroxide

Toxicity data: LDLo - Lowest published lethal dose oral rabbit 500 mg /kg ;
LD₅₀ intraperitoneal mouse 40 mg/kg

Irritation data: Standard Draize Tests: 500 mg/24 hour(s) skin-rabbit severe;
400 µg eyes-rabbit mild; 1 percent eyes-rabbit severe;

Mutagenicity: There is no evidence of mutagenic potential.

Reproductive Effects: No information is available.

Teratogenicity and Fetotoxicity: No information is available.

Synergistic Materials: No information is available.

Skin and Respiratory Sensitization: No information is available.

Irritancy: Strong eye and skin irritant.

SECTION 12 – ECOLOGICAL INFORMATION

Ecotoxicological Information:

LC₁₀₀ Cyprinus Carpio 180 ppm/24 hr @ 25°C (77°F)

TLm mosquito fish 125 ppm/96 hr (fresh water);

TLm Bluegill 99 mg/L/48 hr (tap water)

Persistence and Degradation: Degrades readily by reacting with natural carbon dioxide in the air. Does not bioaccumulate.

SECTION 13 – DISPOSAL CONSIDERATIONS

Review federal, state and local government requirements prior to disposal.

Do not dispose of waste with normal garbage, or to sewer systems.

Whatever cannot be saved for recovery or recycling, including containers, should be managed in an appropriate and approved waste disposal facility. Processing, use or contamination of this product may change the waste management options.

RCRA: Test waste material for corrosivity, D002, prior to disposal.

SODIUM HYDROXIDE SOLUTION, 50%

Update/Review: February 8, 2011

SECTION 14 – TRANSPORT INFORMATION

	TDG	DOT
Shipping Name	SODIUM HYDROXIDE, SOLUTION	Sodium hydroxide, solution
Hazard Class/Division	8	8
Identification No.	UN1824	UN1824
Packing Group:	II	II
Reportable Quantity	Not Applicable	RQ: 1000 lbs. (454 kg)
ERAP	NONE	Not Applicable

- Δ **IATA/ICAO Shipping Description:** UN1824, Sodium hydroxide solution, Class 8, PG II is accepted for air transport.
- Δ **For Chemical Emergencies in Transportation Requiring Activation of Olin 24 Hour Emergency Response Plan Call:**
- U.S. 1-800-424-9300 – Chemtrec
Canada 1-800-567-7455

SECTION 15 – REGULATORY INFORMATION

Δ **CANADIAN INFORMATION:**

This product has been classified in accordance with the hazard criteria of the CPR (Controlled Products Regulations) and this MSDS (Material Safety Data Sheet) contains all the information required by the CPR.

Controlled Products Regulations (WHMIS) Classification:

E: Corrosive Material

CEPA / Canadian Domestic Substances List (DSL): Y

WHMIS Ingredient Disclosure List: Meets criteria for disclosure at 1% or greater.

Δ **USA INFORMATION:**

OSHA Classification: Hazardous by definition of Hazard Communication Standard (29 CFR 1910.1200)

SARA Regulations sections 313 and 40 CFR 372: N

SARA Hazard Categories, SARA SECTIONS 311/312 (40 CFR 370.2):

ACUTE: Y

CHRONIC: N

FIRE: N

REACTIVE: Y

SUDDEN RELEASE: N

OSHA PROCESS SAFETY (29 CFR 1910.119): N

CERCLA SECTION 103 (40 CFR 302.4): Y

Reportable Quantity (RQ) under CERCLA: 1000 lbs. (454 kg)

SODIUM HYDROXIDE SOLUTION, 50%

Update/Review: February 8, 2011

Page 9 of 10

TSCA Inventory Status: Y

This product does not contain nor is it manufactured with ozone depleting substances.

△ EUROPEAN ECONOMIC COMMUNITY (EEC) INFORMATION:

EINECS Number: 215-185-5

CALIFORNIA PROP 65 COMPONENTS:

This product is not listed, but it may contain elements known to the State of California to cause cancer or reproductive toxicity as listed under Proposition 65 State Drinking Water and Toxic Enforcement Act. For additional information, contact Olin Technical Services (800-299-6546)

SECTION 16 – OTHER INFORMATION

- △ The information contained herein is offered only as a guide to the handling of this specific material and has been prepared in good faith by technically knowledgeable personnel. It is not intended to be all-inclusive and the manner and conditions of use and handling may involve other and additional considerations. No warranty of any kind is given or implied and Olin will not be liable for any damages, losses, injuries or consequential damages that may result from the use of or reliance on any information contained herein. This Material Safety Data Sheet is valid for three years.

Revision Indicators:

- △ In the left margin indicates a revision or addition of information since the previous issue.

**National Fire Protection Association (NFPA) Rating
Hazardous Materials Identification System (HMIS) Rating**

	NFPA	HMIS	
HEALTH	3	3	4 = Extreme/Severe
FIRE	0	0	3 = High/Serious
REACTIVITY / INSTABILITY	1	1	2 = Moderate
SPECIAL HAZARDS	N/Ap	N/Ap	1 = Slight
			0 = Minimum
			W = Water Reactive
			OX = Oxidizer
			* = Chronic health hazard

MATERIAL SAFETY DATA SHEET

Section 1. Chemical Product and Company Identification

Product Name: ChemTreat RL124
Product Use: Reverse Osmosis Treatment
Supplier's Name: ChemTreat, Inc.
Emergency Telephone Number: (800) 424-9300 (Toll Free)
(703) 527-3887
Address (Corporate Headquarters): 4461 Cox Road
Glen Allen, VA 23060
Telephone Number for Information: (800) 648-4579
Date of MSDS: September 14, 2010

Section 2. Hazard(s) Identification

Signal Word: WARNING!

Hazard Statement(s): Causes eye irritation.
Causes skin irritation.
Harmful if inhaled.
May be harmful if swallowed.

Precautionary Statement(s): Wear protective gloves/clothing and eye/face protection. Do not breathe dust/fume/gas/mist/vapors/spray. Do not eat, drink or smoke when using this product. Wash hands thoroughly after handling. Use only outdoors or in a well-ventilated area.

Section 3. Composition/Hazardous Ingredients

Component	CAS Registry #	Wt. %
Sodium bisulfite	7631-90-5	15 - 40

Section 4. First Aid Measures

Inhalation: Remove to fresh air and keep at rest in a position comfortable for breathing. Call a poison center or doctor/physician if you feel unwell.

Eyes: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. If eye irritation persists, get medical advice/attention.

Skin: Wash with plenty of soap and water. Take off contaminated clothing and wash before re-use. If skin irritation occurs, seek medical advice/attention.

Ingestion: DO NOT INDUCE VOMITING. Rinse mouth. Call a POISON CENTER or doctor/physician if you feel unwell.

Notes to Physician: N/A

Additional First Aid Remarks: N/A

Section 5. Fire Fighting Measures

Flammability of the Product: Not flammable.

Suitable Extinguishing Media: Use extinguishing media suitable to surrounding fire.

Specific Hazards Arising from the Chemical: Use water spray to keep containers cool.

Protective Equipment: If product is involved in a fire, wear full protective clothing including a positive-pressure, NIOSH approved, self-contained breathing apparatus.

Section 6. Accidental Release Measures

Personal Precautions: Use appropriate Personal Protective Equipment (PPE).

Environmental Precautions: Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains, and sewers.

Methods for Cleaning up: Contain and recover liquid when possible. Flush spill area with water spray.

Other Statements: If RQ (Reportable Quantity) is exceeded, report to National Spill Response Office at 1-800-424-8802.

Section 7. Handling and Storage

Handling: Wear appropriate Personal Protective Equipment (PPE) when handling this product. Do not get in eyes, or on skin and clothing. Wash thoroughly after handling. Do not ingest. Avoid breathing vapors, mist or dust.

Storage: Store away from incompatible materials (see Section 10). Store at ambient temperatures. Keep container securely closed when not in use. Label precautions also apply to empty container. Recondition or dispose of empty containers in accordance with government regulations. For Industrial use only. Do not store below 30°F.

Section 8. Exposure Controls/Personal Protection

Exposure Limits

Component	Source	Exposure Limits
Sodium bisulfite	ACGIH TLV	5 mg/m ³ TWA

Carcinogenicity Category

Component	Source	Code	Brief Description
Sodium bisulfite			N/E

Engineering Controls:

Use only with adequate ventilation. The use of local ventilation is recommended to control emission near the source.

Personal Protection

- Eyes:** Wear chemical splash goggles or safety glasses with full-face shield. Maintain eyewash fountain in work area.
- Skin:** Maintain quick-drench facilities in work area.
Wear butyl rubber or neoprene gloves. Wash them after each use and replace as necessary. If conditions warrant, wear protective clothing such as boots, aprons, and coveralls to prevent skin contact.
- Respiratory:** If misting occurs, use NIOSH approved organic vapor/acid gas dual cartridge respirator with a dust/mist prefilter in accordance with 29 CFR 1910.134.

Section 9. Physical and Chemical Properties

Physical State and Appearance:	Liquid, Yellow, Clear
Specific Gravity:	1.2350
pH:	3.9
Freezing Point:	30°F
Flash Point:	N/D
Odor:	Strong
Melting Point:	N/A
Boiling Point:	212°F
Solubility in Water:	Complete
Evaporation Rate:	<1
Vapor Density:	N/D
Molecular Weight:	N/D
Viscosity:	<100
Flammable Limits:	N/A
Autoignition Temperature:	N/A
Density:	10.30 lb/ga
Vapor Pressure:	<17.5

% VOC

N/D

Section 10. Stability and Reactivity

Chemical Stability: Stable at normal temperatures and pressures.

Incompatibility with Various Substances: Strong oxidizers, Strong bases, Strong acids

Hazardous Decomposition Products: Sulfur dioxide gas

Possibility of Hazardous Reactions: None known.

Section 11. Toxicological Information

Chemical Name	Exposure	Type of Effect	Concentration	Species
Sodium bisulfite	Oral	LD50	2000 mg/kg	Rat

Comments: None.

Section 12. Ecological Information

Species	Duration	Type of Effect	Test Results
Fathead Minnow	96h	LC50	>1000 mg/l
Sheepshead Minnow	96h	LC50	100 mg/l
Ceriodaphnia dubia	48h	LC50	390.4 mg/l
Mysid Shrimp	48h	LC50	70.7 mg/l

Comments: None.

Section 13. Disposal Considerations

Dispose of in accordance with local, state and federal regulations.

Section 14. Transport Information

DOT Classification

DOT Name: BISULFITES, AQUEOUS SOLUTIONS, N.O.S.
Technical Name: (SODIUM BISULFITE)
Hazard Class: Corrosive
UN/NA#: UN2693
Packing Group: PGIII

Section 5. Fire Fighting Measures

Flammability of the Product: Not flammable.

Suitable Extinguishing Media: Use extinguishing media suitable to surrounding fire.

Specific Hazards Arising from the Chemical: None known.

Protective Equipment: If product is involved in a fire, wear full protective clothing including a positive-pressure, NIOSH approved, self-contained breathing apparatus.

Section 6. Accidental Release Measures

Personal Precautions: Use appropriate Personal Protective Equipment (PPE).

Environmental Precautions: Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains, and sewers.

Methods for Cleaning up: Contain and recover liquid when possible. Flush spill area with water spray.

Other Statements: None.

Section 7. Handling and Storage

Handling: Wear appropriate Personal Protective Equipment (PPE) when handling this product. Do not get in eyes, or on skin and clothing. Wash thoroughly after handling. Do not ingest. Avoid breathing vapors, mist or dust.

Storage: Store away from incompatible materials (see Section 10). Store at ambient temperatures. Keep container securely closed when not in use. Label precautions also apply to empty container. Recondition or dispose of empty containers in accordance with government regulations. For Industrial use only. Protect from heat and sources of ignition. Do not store above 95°F.

Section 8. Exposure Controls/Personal Protection

Exposure Limits

Component	Source	Exposure Limits
Proprietary		N/E

Carcinogenicity Category

Component	Source	Code	Brief Description
Proprietary			N/E

Engineering Controls:

Use only with adequate ventilation. The use of local ventilation is recommended to control emission near the source.

Personal Protection

- Eyes:** Wear chemical splash goggles or safety glasses with full-face shield. Maintain eyewash fountain in work area.
- Skin:** Maintain quick-drench facilities in work area.
Wear butyl rubber or neoprene gloves. Wash them after each use and replace as necessary. If conditions warrant, wear protective clothing such as boots, aprons, and coveralls to prevent skin contact.
- Respiratory:** If misting occurs, use NIOSH approved organic vapor/acid gas dual cartridge respirator with a dust/mist prefilter in accordance with 29 CFR 1910.134.

Section 9. Physical and Chemical Properties

Physical State and Appearance:	Liquid, Amber, Clear
Specific Gravity:	1.119 @ 20°C
pH:	10.8 @ 20°C, 10.0%
Freezing Point:	28°F
Flash Point:	N/D
Odor:	Strong
Melting Point:	N/A
Boiling Point:	212°F
Solubility in Water:	Complete
Evaporation Rate:	N/D
Vapor Density:	N/D
Molecular Weight:	N/D
Viscosity:	N/A
Flammable Limits:	N/A
Autoignition Temperature:	N/A
Density:	9.33 lb/ga
Vapor Pressure:	N/D
% VOC	0

Section 10. Stability and Reactivity

Chemical Stability:	Stable at normal temperatures and pressures.
Incompatibility with Various Substances:	Strong oxidizers, Strong acids
Hazardous Decomposition Products:	Oxides of nitrogen, Oxides of carbon, Oxides of sulfur
Possibility of Hazardous Reactions:	None known.

Section 11. Toxicological Information

Chemical Name	Exposure	Type of Effect	Concentration	Species
ChemTreat P8007L	Oral	LD50	>5000 mg/kg	Rat

Comments: None.

Section 12. Ecological Information

Species	Duration	Type of Effect	Test Results
Zebra fish	96h	LC50	>100 mg/l
Daphnia magna	48h	EC50	>100 mg/l

Comments: None.

Section 13. Disposal Considerations

Dispose of in accordance with local, state and federal regulations.

Section 14. Transport Information

DOT Classification

DOT Name:	COMPOUND, INDUSTRIAL WATER TREATMENT, LIQUID
Technical Name:	N/A
Hazard Class:	Not D.O.T. Regulated.

Disclaimer

Although the information and recommendations set forth herein (hereinafter "information") are presented in good faith and believed to be correct as of the date hereof, ChemTreat, Inc. makes no representations as to the completeness or accuracy thereof. Information is supplied upon the condition that the persons receiving same will make their own determination as to its suitability for their purposes prior to use. In no event will ChemTreat, Inc. be responsible for damages of any nature whatsoever resulting from the use or reliance upon information. No representation or warranties, either expressed or implied, of merchantability, fitness for a particular purpose, or of any other nature are made hereunder with respect to information or the product to which information refers.

MATERIAL SAFETY DATA SHEET

Section 1. Chemical Product and Company Identification

Product Name: ChemTreat P817E
Product Use: Water Clarification/Solids Conditioning Agent
Supplier's Name: ChemTreat, Inc.
Emergency Telephone Number: (800) 424-9300
Address (Corporate Headquarters): 4461 Cox Road
Glen Allen, VA 23060
Telephone Number for Information: (800) 648-4579
Date of MSDS: November 30, 2009

Section 2. Hazard(s) Identification

Signal Word: WARNING!

Hazard Statement(s): May be harmful in contact with skin.
May be harmful if inhaled.
May be harmful if swallowed.

Precautionary Statement(s): No significant health risks are expected from exposures under normal conditions of use.

Section 3. Composition/Hazardous Ingredients

Component	CAS Registry #	Wt. %
There are no hazardous ingredients in this product as defined in 29 CFR 1910.1200.	Proprietary	N/A

Section 4. First Aid Measures

Inhalation: Remove to fresh air and keep at rest in a position comfortable for breathing. Call a poison center or doctor/physician if you feel unwell.

Eyes: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. If eye irritation persists, get medical advice/attention.

Skin: Wash with plenty of soap and water. Call a poison center or doctor/physician if you feel unwell.

Ingestion: DO NOT INDUCE VOMITING. Rinse mouth. Call a POISON CENTER or doctor/physician if you feel unwell.

Notes to Physician: N/A

Additional First Aid Remarks: N/A

Section 5. Fire Fighting Measures

Flammability of the Product: Not flammable.

Suitable Extinguishing Media: Use extinguishing media suitable to surrounding fire.

Specific Hazards Arising from the Chemical: None known.

Protective Equipment: If product is involved in a fire, wear full protective clothing including a positive-pressure, NIOSH approved, self-contained breathing apparatus.

Section 6. Accidental Release Measures

Personal Precautions: Use appropriate Personal Protective Equipment (PPE).

Environmental Precautions: Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains, and sewers.

Methods for Cleaning up: Contain and recover liquid when possible. Flush spill area with water spray.

Other Statements: None.

Section 7. Handling and Storage

Handling: Wear appropriate Personal Protective Equipment (PPE) when handling this product. Do not get in eyes, or on skin and clothing. Wash thoroughly after handling. Do not ingest. Avoid breathing vapors, mist or dust. Material is very slippery if spilled.

Storage: Store away from incompatible materials (see Section 10). Store at ambient temperatures. Keep container securely closed when not in use. Label precautions also apply to empty container. Recondition or dispose of empty containers in accordance with government regulations. For Industrial use only. Keep from freezing. Do not store below 41°F. Do not store above 86°F.

Section 8. Exposure Controls/Personal Protection

Exposure Limits

Component	Source	Exposure Limits

“...providing sulfide reagents for treatment of COPR and other metal-bearing wastes...”

Material Safety Data Sheet

FerroBlack (Hybrid)

Section 1: CHEMICAL PRODUCT and COMPANY IDENTIFICATION

1.1 Product Name:	FerroBlack
Chemical Family:	Inorganic salt solution
Synonyms:	IRON (II) SULFIDE, FERROUS SULPHIDE, IRON (II) SULPHIDE
Formula:	FeS
1.2 Manufacturer Information:	Redox Solutions, LLC
	11550 N. Meridian Street, Suite 180
	Carmel, IN 46032
1.3 Emergency Contact:	(317) 660-6867

Section 2: COMPOSITION, INFORMATION ON INGREDIENTS

2.1 Chemical Ingredients (% by wt.)

Ferrous Sulfide Slurry	CAS #:1317-37-9	7%-8%
Sodium Hydrosulfide	CAS #:16721-80-5	1%-2%
Water	CAS #:7732-18-5 71	80% -82%

Section 3: HAZARDS IDENTIFICATION

NFPA: **Health - 0** **Flammability - 0** **Reactivity - 2**

May be irritating to eyes and mucous membranes. Avoid inhalation of any fumes which may be given off when used or when bottle is opened. Consider toxic orally or by inhalation. LD/TD no data. PEL/TLV:TWA 1mg(Fe)/m³. No known carcinogenicity.

Section 4: FIRST AID MEASURES

4.1 EYES: Immediately flush with large quantities of water for 15 minutes. Hold eyelids apart during irrigation to insure thorough flushing of the entire area of the eye and lids. Obtain immediate medical attention.

4.2 SKIN: Immediately flush with large quantities of water. Remove contaminated clothing under a safety shower.

4.3 INGESTION: If swallowed, give water or milk and induce vomiting. Call a physician.

Section 5: FIRE FIGHTING MEASURES

5.1 FLAMMABLE PROPERTIES

FLASH POINT: Not flammable **METHOD USED:** NA

5.2 EXTINGUISHING MEDIA: Use extinguishing media appropriate for surrounding fire

Section 6: ACCIDENTAL RELEASE MEASURES

6.1 Releases: Confine and absorb small releases on sand, earth or other inert absorbent. Dispose in accordance with all applicable environmental regulations.

Section 7: HANDLING and STORAGE

7.1 Handling: Use only with adequate ventilation. Use protective clothing to prevent contact with skin or eyes.

7.2 Storage: Store in well ventilated areas. Do not store combustibles in the area of storage vessels. Keep away from any sources of heat or flame. Store tote and smaller containers out of direct sunlight at moderate temperatures [$<80^{\circ}\text{F}$ (27°C)]. (See addendum for materials of construction)

Section 8: EXPOSURE CONTROLS, PERSONAL PROTECTION

8.1 RESPIRATORY PROTECTION: None required if adequate ventilation is provided.

8.2 SKIN PROTECTION: Proper Gloves

8.3 EYE PROTECTION: Safety glasses with side-shield.

Section 9: PHYSICAL and CHEMICAL PROPERTIES

9.1 APPEARANCE: Black liquid with visible suspended solids

9.2 ODOR: No appreciable odor.

9.3 BOILING POINT: Not determined

9.4 VAPOR PRESSURE: Not determined (Believed to be minimal)

9.5 VAPOR DENSITY: Not determined

9.6 SOLUBILITY IN WATER: Insoluble.

9.7 SPECIFIC GRAVITY: 1.21

9.8 FREEZING POINT: Not determined

9.9 pH: 9.5 – 12.3

9.10 VOLATILE:

Not applicable

Section 10: STABILITY and REACTIVITY

10.1 STABILITY: This is a stable material

10.2 HAZARDOUS POLYMERIZATION: Will not occur.

10.3 INCOMPATIBILITY: Acids will cause the release of highly toxic Hydrogen Sulfide. Reacts violently with diazonium salts. Sodium Hydrosulfide solution is not compatible with copper, zinc, aluminum or their **alloys** (i.e. bronze, brass, galvanized metals, etc.). Corrosive to steel above 150° F (65.5° C). These materials of construction should not be used in handling systems or storage containers for this product.

Section 11: TOXICOLOGICAL INFORMATION

Not generally regarded as a health hazard.

Section 12: DISPOSAL CONSIDERATIONS

If released to the environment for other than its intended purpose, this product should be checked to see it meets the criteria of a reactive sulfide D003, Reactive waste.

Section 14: TRANSPORT INFORMATION

14.1 DOT Shipping Name: Non-hazardous, Non-Regulated Liquid (Ferrous Sulfide Slurry)

14.2 DOT Hazard Class: NA

14.3 UN/NA Number: NA

14.4 Packing Group: NA

14.5 DOT Placard: NA

14.6 DOT Label(s): NA

14.7 IMO Shipping Name: Not Determined

14.8 RQ (Reportable Quantity): NA

14.9 RR STCC Number: Not Determined

Section 13: DISCLOSURE

While the information and recommendations contained herein are based on data that is believed to be correct, Redox Solutions, LLC makes no guarantee or warranty of any kind, expressed or implied with respect to the information contained herein. We reserve the right to revise material safety data sheets periodically as new information becomes available. (MSDS Revised: 6/27/10)

MATERIAL SAFETY DATA SHEET

Date: 3/15/96

Revision: 2/1/06

1. CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

Product Name: **MOLASSES, MOLASSES BLENDS & BINDERS**

Chemical Name: NA

Chemical Formula

Use:

Mixture of liquid

Agricultural commodities

Trade Name - Molasses/Molasses Blends

Company Identification:

Westway Feed Products, Inc.

14015 Park Drive, Suite 217

Tomball, TX 77377

(800) 654-9668

NFPA HAZARD CLASS: (0) Health, (0) Flammability, (0) and Reactivity

2. COMPOSITION, INFORMATION ON INGREDIENTS

CAS Registry No.

%(Approx.)

ACGIH TLV-TWA

Proprietary

NA

No data

See ingredient tag

3. HAZARDS IDENTIFICATION

Potential Health Effects

Eyes: Contact may cause mild irritant of stinging, watering and redness.

Skin: Contact may cause mild irritant of redness and burning.

Inhalation: No information available. Could maybe be an irritant to respiratory tract. Insufficient oxygen may be present in vessels containing the product due to the generation of carbon monoxide during fermentation

Ingestion: No information available. Studies would suggest gastrointestinal irritation; nausea, vomiting and diarrhea may be possible.

Potential Chronic Health Effects: No Potential chronic effects known. Urea is a naturally occurring chemical in the body. It is an end product of protein metabolism and is excreted in urine.

Cancer: No known contributing evidence available at this time.

4. FIRST AID MEASURES

Eyes: Flush eyes for 15 minutes.

Skin: Wash with soap and water.

Ingestion: No data

5. FIRE FIGHTING MEASURES

Flashpoint (Method used)

Flammable Limits in Air

Non-flammable	Non-flammable
Non-combustible	Non-combustible

Extinguishing	Agents	-	NA
---------------	--------	---	----

Unusual Fire and Explosion Hazards - Fermentation occurs when diluted with water and is accelerated by heat. During fermentation carbon monoxide with possible traces of ethanol or volatile fatty acids (e.g., acetic, propionic, lactic, or butyric) is given off, which produces inhalation hazards and possible explosion hazards.

6. ACCIDENTAL RELEASE MEASURES

Small Spills: Absorb with commercial or other absorbent and shovel into container for proper disposal.

Large Spill: Stop the source of the spill. Dike up with absorbent material for containment. Prevent the release from entering a waterway or sewer. Recover useable product. Mop up or pump material into a container (metal/plastic bin) for proper disposition at an approved facility such as a municipal landfill or land application site. If solid crystals form as the material cools, add water to help clean up.

Release Notes: If spill could potentially enter any waterway such as small creeks, contact local authorities. For navigable waterways contact the US Coast Guard National Response Center 800-424-8802. Notify as appropriate federal, state and local agencies. Clean up any spills immediately.

7. HANDLING AND STORAGE

This material should be stored in a vented tank designed to contain a material with a specific gravity of 1.3 or greater. Material can ferment if excessive moisture contamination is allowed. Fermentation can yield carbon dioxide with possible traces of ethanol or volatile fatty acids (e.g. acetic, propionic, lactic, or butyric) and if exposed to a spark or flame may result in an explosion. These conditions should be avoided.

If maintenance of tank requires entry by personnel, OSHA's Confined Space standard (29CFR1910.146) shall be complied with. If welding is to be performed, the tank should be gas freed and only certified welders shall perform welding operations.

Handling: Avoid contact with eyes or prolonged skin contact.

Storage: Protect against physical or chemical contamination.

8. EXPOSURE CONTROLS, PERSONAL PROTECTION

Respiratory Protection - None

Ventilation - Provide adequate ventilation to prevent accumulation of vapors.

Skin Protection - Rubber gloves

Eye Protection - Safety glasses

Hygiene - Wash any exposed area promptly with soap and water. Launder contaminated clothing

Other Control Measures - None

.....
9. PHYSICAL AND CHEMICAL PROPERTIES
.....

Appearance	Odor
Dark brown syrupy liquid	Sweet
.....

FERROUS SULFATE

1. Product Identification

Synonyms: Iron (II) sulfate (1:1)c; sulfuric acid, iron (2+) salt (1:1), heptahydrate
CAS No.: 7720-78-7 (Anhydrous) 7782-63-0 (heptahydrate)
Molecular Weight: 278
Chemical Formula: FeSO₄ 7H₂O
Product Codes:
J.T. Baker: 2063, 2070, 2074
Mallinckrodt: 5055, 5056, 5401, 5572

2. Composition/Information on Ingredients

Ingredient	CAS No	Percent	Hazardous
Ferrous Sulfate	7720-78-7	99 - 100%	Yes

3. Hazards Identification

Emergency Overview

WARNING! HARMFUL IF SWALLOWED OR INHALED. CAUSES IRRITATION TO SKIN, EYES AND RESPIRATORY TRACT. AFFECTS THE LIVER.

SAF-T-DATA^(tm) Ratings (Provided here for your convenience)

Health Rating: 3 - Severe (Life)
Flammability Rating: 0 - None
Reactivity Rating: 1 - Slight
Contact Rating: 2 - Moderate
Lab Protective Equip: GOGGLES; LAB COAT; VENT HOOD; PROPER GLOVES
Storage Color Code: Green (General Storage)

Potential Health Effects

Inhalation:

Causes irritation to the respiratory tract. Symptoms may include coughing, shortness of breath.

Ingestion:

Low toxicity in small quantities but larger dosages may cause nausea, vomiting, diarrhea, and black stool. Pink urine discoloration is a strong indicator of iron poisoning. Liver damage, coma, and death from iron poisoning has been recorded. Smaller doses are much more toxic to children.

Skin Contact:

Causes irritation to skin. Symptoms include redness, itching, and pain.

Eye Contact:

Causes irritation, redness, and pain.

Chronic Exposure:

Severe or chronic ferrous sulfate poisonings may damage blood vessels. Large chronic doses cause rickets in infants. Chronic exposure may cause liver effects. Prolonged exposure of the eyes may cause discoloration.

Aggravation of Pre-existing Conditions:

Persons with pre-existing skin disorders or eye problems, or impaired liver, kidney or respiratory function may be more susceptible to the effects of the substance.

4. First Aid Measures

Inhalation:

Remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention.

Ingestion:

Induce vomiting immediately as directed by medical personnel. Never give anything by mouth to an unconscious person. Get medical attention.

Skin Contact:

Immediately flush skin with plenty of soap and water for at least 15 minutes. Remove contaminated clothing and shoes. Get medical attention. Wash clothing before reuse. Thoroughly clean shoes before reuse.

Eye Contact:

Immediately flush eyes with plenty of water for at least 15 minutes, lifting lower and upper eyelids occasionally. Get medical attention immediately.

5. Fire Fighting Measures

Fire:

Not considered to be a fire hazard.

Explosion:

Not considered to be an explosion hazard.

Fire Extinguishing Media:

Use any means suitable for extinguishing surrounding fire.

Special Information:

Use protective clothing and breathing equipment appropriate for the surrounding fire.

6. Accidental Release Measures

Ventilate area of leak or spill. Wear appropriate personal protective equipment as specified in Section 8. Spills: Pick up and place in a suitable container for reclamation or disposal, using a method that does not generate dust. US Regulations (CERCLA) require reporting spills and releases to soil, water and air in excess of reportable quantities. The toll free number for the US Coast Guard National Response Center is (800) 424-8802.

7. Handling and Storage

Keep in a tightly closed container, stored in a cool, dry, ventilated area. Protect against physical damage. Maintain a constant temperature not to exceed 24 degrees centigrade (75 degrees fahrenheit). Fluctuating temperatures causes product oxidation. Do not use this product if coated with brownish-yellow basic ferric sulfate. Isolate from incompatible substances. Containers of this material may be hazardous when empty since they retain product residues (dust, solids); observe all warnings and precautions listed for the product.

8. Exposure Controls/Personal Protection

Airborne Exposure Limits:

-ACGIH Threshold Limit Value (TLV):

1 mg/m³ (TWA) soluble iron salt as Fe

Ventilation System:

A system of local and/or general exhaust is recommended to keep employee exposures below the Airborne Exposure Limits. Local exhaust ventilation is generally preferred because it can control the emissions of the contaminant at its source, preventing dispersion of it into the general work area. Please refer to the ACGIH document, *Industrial Ventilation, A Manual of Recommended Practices*, most recent edition, for details.

Personal Respirators (NIOSH Approved):

If the exposure limit is exceeded and engineering controls are not feasible, a half facepiece particulate respirator (NIOSH type N95 or better filters) may be worn for up to ten times the exposure limit or the maximum use concentration specified by the appropriate regulatory agency or respirator supplier, whichever is lowest. A full-face piece particulate respirator (NIOSH type N100 filters) may be worn up to 50 times the exposure limit, or the maximum use concentration specified by the appropriate regulatory agency, or respirator supplier, whichever is lowest. If oil particles (e.g. lubricants, cutting fluids, glycerine, etc.) are present, use a NIOSH type R or P filter. For emergencies or instances where the exposure levels are not known, use a full-facepiece positive-pressure, air-supplied respirator. WARNING: Air-purifying respirators do not protect workers in oxygen-deficient atmospheres.

Skin Protection:

Wear impervious protective clothing, including boots, gloves, lab coat, apron or coveralls, as appropriate, to prevent skin contact.

Eye Protection:

Use chemical safety goggles and/or full face shield where dusting or splashing of solutions is possible. Maintain eye wash fountain and quick-drench facilities in work area.

9. Physical and Chemical Properties

Appearance:

Blue green crystals.

Odor:

Odorless.

Solubility:

48.6 g/100 g water @ 50C (122F)

Density:

1.90

pH:

No information found.

% Volatiles by volume @ 21C (70F):

0

Boiling Point:

> 300C (> 572F) Decomposes.

Melting Point:

57C (135F) Loses water

Vapor Density (Air=1):

No information found.

Vapor Pressure (mm Hg):

No information found.

Evaporation Rate (BuAc=1):

No information found.

10. Stability and Reactivity

Stability:

Stable under ordinary conditions of use and storage. Loses water in dry air and oxidizes upon exposure to moisture, forming a brown coating of extremely corrosive basic ferric sulfate.

Hazardous Decomposition Products:

Burning may produce sulfur oxides.

Hazardous Polymerization:

This substance does not polymerize.

Incompatibilities:

Alkalis, soluble carbonates, and oxidizing materials. Reacts in moist air to form ferric sulfate.

Conditions to Avoid:

Moisture.

11. Toxicological Information

Oral rat LD50: 319 mg/kg. Investigated as a tumorigen and mutagen.

-----\Cancer Lists\-----			
Ingredient	---NTP Carcinogen---		IARC Category

WHMIS:

This MSDS has been prepared according to the hazard criteria of the Controlled Products Regulations (CPR) and the MSDS contains all of the information required by the CPR.

16. Other Information

NFPA Ratings: Health: 1 Flammability: 0 Reactivity: 0

Label Hazard Warning:

WARNING! HARMFUL IF SWALLOWED OR INHALED. CAUSES IRRITATION TO SKIN, EYES AND RESPIRATORY TRACT. AFFECTS THE LIVER.

Label Precautions:

Avoid contact with eyes, skin and clothing.

Wash thoroughly after handling.

Avoid breathing dust.

Keep container closed.

Use only with adequate ventilation.

Label First Aid:

If swallowed, induce vomiting immediately as directed by medical personnel. Never give anything by mouth to an unconscious person. If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. In case of contact, immediately flush eyes or skin with plenty of water for at least 15 minutes. Remove contaminated clothing and shoes. Wash clothing before reuse. In all cases, get medical attention.

Product Use:

Laboratory Reagent. Bulk pharmaceutical chemical.

Revision Information:

No Changes.

Material Safety Data Sheet

Ferrous sulfide MSDS

Section 1: Chemical Product and Company Identification

Product Name: Ferrous sulfide

Catalog Codes: SLF1171

CAS#: 1317-37-9

RTECS: Not available.

TSCA: TSCA 8(b) inventory: Ferrous sulfide

CI#: Not available.

Synonym:

Chemical Formula: FeS

Contact Information:

Sciencelab.com, Inc.
14025 Smith Rd.
Houston, Texas 77396

US Sales: **1-800-901-7247**
International Sales: **1-281-441-4400**

Order Online: ScienceLab.com

CHEMTREC (24HR Emergency Telephone), call:
1-800-424-9300

International CHEMTREC, call: 1-703-527-3887

For non-emergency assistance, call: 1-281-441-4400

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Ferrous sulfide	1317-37-9	100

Toxicological Data on Ingredients: Ferrous sulfide LD50: Not available. LC50: Not available.

Section 3: Hazards Identification

Potential Acute Health Effects: Very hazardous in case of ingestion. Hazardous in case of eye contact (irritant), of inhalation.

Potential Chronic Health Effects:

Very hazardous in case of ingestion.

Hazardous in case of eye contact (irritant), of inhalation.

CARCINOGENIC EFFECTS: Not available.

MUTAGENIC EFFECTS: Not available.

TERATOGENIC EFFECTS: Not available.

DEVELOPMENTAL TOXICITY: Not available.

Section 4: First Aid Measures

Eye Contact:

Check for and remove any contact lenses. Immediately flush eyes with running water for at least 15 minutes, keeping eyelids open. Cold water may be used. Do not use an eye ointment. Seek medical attention.

Skin Contact: No known effect on skin contact, rinse with water for a few minutes.

Serious Skin Contact: Not available.

Inhalation: Allow the victim to rest in a well ventilated area. Seek immediate medical attention.

Serious Inhalation: Not available.

Ingestion:

Do not induce vomiting. Loosen tight clothing such as a collar, tie, belt or waistband. If the victim is not breathing, perform mouth-to-mouth resuscitation. Seek immediate medical attention.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: May be combustible at high temperature.

Auto-Ignition Temperature: Not available.

Flash Points: Not available.

Flammable Limits: Not available.

Products of Combustion: Some metallic oxides.

Fire Hazards in Presence of Various Substances: Not available.

Explosion Hazards in Presence of Various Substances:

Risks of explosion of the product in presence of mechanical impact: Not available.

Risks of explosion of the product in presence of static discharge: Not available.

Fire Fighting Media and Instructions:

SMALL FIRE: Use DRY chemical powder.

LARGE FIRE: Use water spray, fog or foam. Do not use water jet.

Special Remarks on Fire Hazards: Not available.

Special Remarks on Explosion Hazards: Not available.

Section 6: Accidental Release Measures

Small Spill:

Use appropriate tools to put the spilled solid in a convenient waste disposal container. Finish cleaning by spreading water on the contaminated surface and dispose of according to local and regional authority requirements.

Large Spill:

Use a shovel to put the material into a convenient waste disposal container. Finish cleaning by spreading water on the contaminated surface and allow to evacuate through the sanitary system. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions:

Keep away from heat. Keep away from sources of ignition. Empty containers pose a fire risk, evaporate the residue under a fume hood. Ground all equipment containing material. Do not breathe dust. Avoid contact with eyes. Wear suitable protective clothing. In case of insufficient ventilation, wear suitable respiratory equipment. If

you feel unwell, seek medical attention and show the label when possible. Keep away from incompatibles such as oxidizing agents, acids.

Storage:

Keep container dry. Keep in a cool place. Ground all equipment containing material. Keep container tightly closed. Keep in a cool, well-ventilated place. Combustible materials should be stored away from extreme heat and away from strong oxidizing agents.

Section 8: Exposure Controls/Personal Protection

Engineering Controls:

Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. If user operations generate dust, fume or mist, use ventilation to keep exposure to airborne contaminants below the exposure limit.

Personal Protection: Splash goggles. Lab coat.

Personal Protection in Case of a Large Spill:

Splash goggles. Full suit. Boots. Gloves. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits: TWA: 1 (mg/m³) from ACGIH Consult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Solid. (Crystalline solid.)

Odor: Not available.

Taste: Not available.

Molecular Weight: 87.92 g/mole

Color: Not available.

pH (1% soln/water): Not available.

Boiling Point: Decomposes.

Melting Point: 1194°C (2181.2°F)

Critical Temperature: Not available.

Specific Gravity: 4.84 (Water = 1)

Vapor Pressure: Not applicable.

Vapor Density: Not available.

Volatility: Not available.

Odor Threshold: Not available.

Water/Oil Dist. Coeff.: Not available.

Ionicity (in Water): Not available.

Dispersion Properties: Not available.

Solubility: Very slightly soluble in cold water.

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Not available.

Incompatibility with various substances: Highly reactive with oxidizing agents, acids.

Corrosivity: Non-corrosive in presence of glass.

Special Remarks on Reactivity: Not available.

Special Remarks on Corrosivity: Not available.

Polymerization: No.

Section 11: Toxicological Information

Routes of Entry: Eye contact. Inhalation. Ingestion.

Toxicity to Animals:

LD50: Not available.

LC50: Not available.

Chronic Effects on Humans: Not available.

Other Toxic Effects on Humans:

Very hazardous in case of ingestion.

Hazardous in case of inhalation.

Special Remarks on Toxicity to Animals: Not available.

Special Remarks on Chronic Effects on Humans: Not available.

Special Remarks on other Toxic Effects on Humans: Not available.

Section 12: Ecological Information

Ecotoxicity: Not available.

BOD5 and COD: Not available.

Products of Biodegradation:

Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The products of degradation are more toxic.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:

Section 14: Transport Information

DOT Classification: Not a DOT controlled material (United States).

Identification: Not applicable.

Special Provisions for Transport: Not applicable.

Section 15: Other Regulatory Information

Federal and State Regulations: TSCA 8(b) inventory: Ferrous sulfide

Other Regulations: Not available..

Other Classifications:

WHMIS (Canada): Not controlled under WHMIS (Canada).

DSCL (EEC): R36- Irritating to eyes.

Material Safety Data Sheet

Calmet® Calcium Polysulfide

Page 1 of 6

SECTION 1 PRODUCT & COMPANY IDENTIFICATION

In case of Emergency call CHEMTREC 1-800-424-9300

Supplier	Expo Chemical Co., Inc. 6807 Theall Road, Suite A Houston, Texas 77066 281-895-9200 or 877-258-EXPO (3976) www.expochem.com
Product Name	Calmet® Calcium Polysulfide
Chemical Name	Calcium Polysulfide
Formula	CaS _x
Molecular Weight	200.06
Synonyms	Lime Sulfur

SECTION 2 COMPOSITION/INFORMATION ON INGREDIENTS

Ingredients	Percent	CAS #
Calcium Polysulfide	29	1344-81-6
Inerts	71	-

This document is prepared pursuant to the OSHA Hazard Communication Standard (29 CFR 1910.1200). In addition, other substances not "Hazardous" per this OSHA standard may be listed. Where proprietary ingredients show, the identity may be made available as provided in this standard.

SECTION 3 HAZARDS IDENTIFICATION (POTENTIAL HEALTH EFFECTS)

EMERGENCY OVERVIEW

WARNING: MAY BE FATAL IF SWALLOWED; CORROSIVE TO SKIN; CAUSES IRREVERSIBLE EYE DAMAGE AND SKIN BURNS.

Eye	Chemically burned eye tissue as from Calcium Hydroxide (lye), may produce severe membrane irritation with corneal damage.
Skin	Chemically burned skin as from Calcium Hyrdroxide (lye), may produce systemic toxicity by skin absorption.
Ingestion	This material decomposes in the digestive tract to release Sulfur and Hydrogen Sulfide (H ₂ S). Signs and symptoms of toxicity may include headache, nausea, vomiting, drowsiness, amnesia, tremors, depressed respiration, convulsions, cyanosis and death due to respiratory paralysis. Severe irritation of the digestive tract may also occur.

SECTION 3 HAZARDS IDENTIFICATION, CONTINUED

Inhalation	Symptoms are those of Hydrogen Sulfide (H ₂ S). Inhalation of H ₂ S is irritating to the respiratory tract. If respiratory irritation or any signs or symptoms described in this bulletin occur, move the person to fresh air. If these effects continue, see a medical doctor immediately.
Existing Medical Conditions Possibly Aggravated by Exposure	Skin irritation may be aggravated in individuals with existing skin lesions. Breathing of H ₂ S gas may aggravate acute or chronic asthma and chronic pulmonary disease such as emphysema and bronchitis.

SECTION 4 FIRST AID MEASURES

Remove the patient from immediate source of exposure and assure that the individual is breathing. If not breathing, use artificial respiration. GET MEDICAL ATTENTION.	
Eye	In case of contact, immediately flush eyes with plenty of water for at least 15 minutes using an eyewash fountain. Lift upper and lower lids and rinse well under them. GET MEDICAL ATTENTION.
Skin	Wash all affected areas with plenty of soap and water under a safety shower for at least 15 minutes, while removing contaminated clothing and shoes. Do not attempt to neutralize with chemical agents. Seek medical attention immediately. Discard any contaminated clothing and shoes.
Ingestion	If swallowed, do not give anything but water, see a physician immediately.
Inhalation	Remove victim to fresh air. If not breathing, administer cardiopulmonary resuscitation or artificial respiration. If breathing is difficult or irritation develops, GET MEDICAL ATTENTION.
Notes to Physicians	For severe Hydrogen Sulfide poisoning, successful treatment has involved initial inhalation of Amyl Nitrite pearls for 15 to 30 seconds of each minute until 10 mls of a 3% solution of Sodium Nitrite can be administered intravenously at 2.5 to 5 mls per minute. The Nitrate-induced Methemoglobin is thought to bind the toxic Hydro-Sulfide ion.

SECTION 5 FIRE FIGHTING MEASURES

Flash Point	Not determined.
Hazardous Decomposition Products	Normal combustion products are Carbon Dioxide and Water Vapor and may produce Oxides of Sulfur. Incomplete combustion or thermal decomposition can produce Carbon Monoxide, Oxyhydrocarbon derivatives and Sulfur derivatives including Hydrogen Sulfide.
Extinguishing Media	CO ₂ , Dry Chemical, Foam, Water Spray
Special Fire Fighting Procedures	Smoke from fires may present unusual hazards. avoid breathing smoke. Avoid contact with fall out and runoff. Minimize amount of water used for fire fighting. Do not enter

SECTION 5 FIRE FIGHTING MEASURES, CONTINUED

Special Fire Fighting Procedures, Continued	any enclosed area without full protective equipment, including self-contained breathing equipment. Contain and isolate runoff and debris for proper disposal. Prevent unauthorized entry to fire area. Keep fire-exposed containers cool with water spray. Read entire bulletin.
Additional Procedures	Persons who have been exposed to contaminated smoke should be immediately relieved from duty and checked for symptoms of poisoning. These should not be mistaken for heat exhaustion or smoke inhalation.

SECTION 6 ACCIDENTAL RELEASE MEASURES

Spill	Follow the spill procedures on the container. DO NOT USE ACIDIC CLEANING MATERIALS. Cover spill with generous amount of absorbent such as clay or loam soil. Use a stiff broom to mix thoroughly. Sweep up and place in a disposable container. Scrub contaminated area with detergent soap and water using a stiff broom. Pick up liquid with more absorbent and place in disposable container.
-------	--

SECTION 7 HANDLING AND STORAGE

Handling	Do not heat drums with any welding equipment as explosion may occur. Avoid breathing gas. Do not get in eyes, on skin, or on clothing.
Storage	Store in a cool, dry place in properly designed vessels.

SECTION 8 EXPOSURE CONTROLS/PERSONAL PROTECTION

Protective Equipment Should be Used During the Following Procedures	Manufacture or formulation of this product. Repair and maintenance of contaminated equipment. Clean up or leaks and spills. Any other activity that may result in hazardous exposures.
Respiratory Protection	Use NIOSH/MSHA approved full face respirator with H ₂ S gas cartridge. Use positive pressure self-contained breathing apparatus for emergency or other conditions requiring a higher level of protection.
Ventilation	Use local exhaust as needed to maintain airborne exposure below exposure limits.
Skin Protection	Full-body protective clothing, chemical-resistant gloves and boots.
Eye Protection	Chemical Worker's Goggles and full-face shield.
General	Maintain a sink, safety shower and eyewash fountain in the work area. Have oxygen readily available.

SECTION 9 PHYSICAL AND CHEMICAL PROPERTIES

Physical State	Liquid
Color	Deep Red/Orange
Odor	Pungent Odor of Rotten Eggs
Specific Gravity	1.273 @ 20° C (H ₂ O = 1)
Solubility in Water	Soluble
pH	11.5 - 11.8

SECTION 10 STABILITY AND REACTIVITY

Stability	Stable to boiling point, will lose water above this temperature.
Conditions to Avoid	Elevated temperatures can cause containers to burst.
Incompatibility	Avoid contact with Acids. Hydrogen Sulfide gas will be generated, dangerous to inhale, explosive at critical concentration.
Hazardous Polymerization	None.

SECTION 11 TOXICOLOGICAL INFORMATION

Exposure Limits	Chemical Name(s)	AGGIM (TLV)	OSHA (TWA)
	Calcium Polysulfide	None	None
Oral LD ₅₀ (rat)	(M) 820 mg/kg (F) 820 mg/kg		
Dermal LD ₅₀ (rabbit)	> 2000 mg/kg		
Inhalation LC ₅₀ (rat - 4 hour exposure)	(M) 3.9 mg/L (F) 3.1 mg/L		
Skin Effects (rabbit)	Mildly irritating		
Eye Effects (rabbit)	Irreversible damage due to high pH		
Carcinogenicity	None determined		
Signs of Poisoning	See Section 3, Potential Health Effects		

SECTION 12 ECOLOGICAL INFORMATION

No data available.

SECTION 13 DISPOSAL

Waste Disposal	All contaminated materials should be placed in disposable containers and buried in an approved dumping area. Disposal should be in accordance with applicable Federal, State, and local regulations. Chemical additions, processing or otherwise altering this material may make the information presented in this MSDS incomplete, inaccurate or otherwise inappropriate.
-----------------------	--

SECTION 14 TRANSPORT INFORMATION

DOT Classification	Not Regulated for Transport
Proper Shipping Name	Lime Sulfur Solution
DOT Identification Number	NOS
National Motor Freight Classification, (NMFC)	102180

SECTION 15 REGULATORY INFORMATION

United States	TSCA: This product is listed on TSCA inventory.	
	SARA Title III Hazard Classification	
	Immediate (Acute) Health	Yes
	Delayed (Chronic) Health	No
	Fire	No
	Sudden Release of Pressure	No
	Reactive	Yes

FERROUS SULFATE DRIED

1. Product Identification

Synonyms: Ferrous sulphate; iron sulfate; sulfuric acid, iron (2+) salt (1:1),

CAS No.: 7720-78-7

Molecular Weight: Not applicable to mixtures.

Chemical Formula: $\text{FeSO}_4 \cdot x\text{H}_2\text{O}$

Product Codes: 5051, 5058, 5069, 5075, 5098, 6714

2. Composition/Information on Ingredients

Ingredient	CAS No	Percent	Hazardous
Ferrous Sulfate	7720-78-7	100%	Yes

3. Hazards Identification

Emergency Overview

WARNING! HARMFUL IF SWALLOWED OR INHALED. CAUSES IRRITATION TO SKIN, EYES AND RESPIRATORY TRACT. AFFECTS THE LIVER.

SAF-T-DATA^(tm) Ratings (Provided here for your convenience)

Health Rating: 3 - Severe (Life)

Flammability Rating: 0 - None

Reactivity Rating: 1 - Slight

Contact Rating: 2 - Moderate

Lab Protective Equip: GOGGLES; LAB COAT; VENT HOOD; PROPER GLOVES

Storage Color Code: Green (General Storage)

Potential Health Effects

Inhalation:

Causes irritation to the respiratory tract. Symptoms may include coughing, shortness of breath.

Ingestion:

Low toxicity in small quantities but larger dosages may cause nausea, vomiting, diarrhea, and black stool. Pink urine discoloration is a strong indicator of iron poisoning. Liver damage, coma, and death from iron poisoning has been recorded. Smaller doses are much more toxic to children.

Skin Contact:

Causes irritation to skin. Symptoms include redness, itching, and pain.

Eye Contact:

Causes irritation, redness, and pain.

Chronic Exposure:

Severe or chronic ferrous sulfate poisonings may damage blood vessels. Large chronic doses cause rickets in infants. Chronic exposure may cause liver effects. Prolonged exposure of the eyes may cause discoloration.

Aggravation of Pre-existing Conditions:

Persons with pre-existing skin disorders or eye problems, or impaired liver, kidney or respiratory function may be more susceptible to the effects of the substance.

4. First Aid Measures

Inhalation:

Remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention.

Ingestion:

Induce vomiting immediately as directed by medical personnel. Never give anything by mouth to an unconscious person. Get medical attention.

Skin Contact:

Immediately flush skin with plenty of soap and water for at least 15 minutes. Remove contaminated clothing and shoes. Get medical attention. Wash clothing before reuse. Thoroughly clean shoes before reuse.

Eye Contact:

Immediately flush eyes with plenty of water for at least 15 minutes, lifting lower and upper eyelids occasionally. Get medical attention immediately.

5. Fire Fighting Measures

Fire:

Not considered to be a fire hazard.

Explosion:

Not considered to be an explosion hazard.

Fire Extinguishing Media:

Use any means suitable for extinguishing surrounding fire.

Special Information:

Use protective clothing and breathing equipment appropriate for the surrounding fire.

6. Accidental Release Measures

Ventilate area of leak or spill. Wear appropriate personal protective equipment as specified in Section 8. Spills: Pick up and place in a suitable container for reclamation or disposal, using a method that does not generate dust. US Regulations (CERCLA) require reporting spills and releases to soil, water and air in excess of reportable quantities. The toll free number for the US Coast Guard National Response Center is (800) 424-8802.

7. Handling and Storage

Keep in a well closed container stored under cold to warm conditions, 2 to 40 C, (36 to 104F). Protect against physical damage. Isolate from incompatible substances. Containers of this material may be hazardous when empty since they retain product residues (dust, solids); observe all warnings and precautions listed for the product.

8. Exposure Controls/Personal Protection

Airborne Exposure Limits:

-ACGIH Threshold Limit Value (TLV):

1 mg/m³ (TWA) soluble iron salt as Fe

Ventilation System:

A system of local and/or general exhaust is recommended to keep employee exposures below the Airborne Exposure Limits. Local exhaust ventilation is generally preferred because it can control the emissions of the contaminant at its source, preventing dispersion of it into the general work area. Please refer to the ACGIH document, *Industrial Ventilation, A Manual of Recommended Practices*, most recent edition, for details.

Personal Respirators (NIOSH Approved):

If the exposure limit is exceeded, a half-face dust/mist respirator may be worn for up to ten times the exposure limit or the maximum use concentration specified by the appropriate regulatory agency or respirator supplier, whichever is lowest. A full-face piece dust/mist respirator may be worn up to 50 times the exposure limit, or the maximum use concentration specified by the appropriate regulatory agency, or respirator supplier, whichever is lowest. For emergencies or instances where the exposure levels are not known, use a full-facepiece positive-pressure, air-supplied respirator. **WARNING:** Air-purifying respirators do not protect workers in oxygen-deficient atmospheres.

Skin Protection:

Wear impervious protective clothing, including boots, gloves, lab coat, apron or coveralls, as appropriate, to prevent skin contact.

Eye Protection:

Use chemical safety goggles and/or full face shield where dusting or splashing of solutions is possible. Maintain eye wash fountain and quick-drench facilities in work area.

9. Physical and Chemical Properties

Appearance:

White to slightly yellow tinged powder.

Odor:

Odorless.

Solubility:

Soluble in water.

Density:

No information found.

pH:

No information found.

% Volatiles by volume @ 21C (70F):

0

Boiling Point:

Not applicable.

Melting Point:

500C (932F)

Vapor Density (Air=1):

No information found.

Vapor Pressure (mm Hg):

No information found.

Evaporation Rate (BuAc=1):

No information found.

10. Stability and Reactivity

Stability:

Stable under ordinary conditions of use and storage.

Hazardous Decomposition Products:

Burning may produce sulfur oxides.

Hazardous Polymerization:

Will not occur.

Incompatibilities:

Alkalis, soluble carbonates, and oxidizing materials. Reacts in moist air to form ferric sulfate.

Conditions to Avoid:

Moisture.

11. Toxicological Information

Ferrous sulfate heptahydrate: Oral mouse LD50: 1520 mg/kg, investigated as a mutagen. Ferrous sulfate anhydrous: oral rat LD50: 319 mg/kg; investigated as a mutagen, tumorigen, reproductive effector.

No information found.

13. Disposal Considerations

Whatever cannot be saved for recovery or recycling should be managed in an appropriate and approved waste disposal facility. Processing, use or contamination of this product may change the waste management options. State and local disposal regulations may differ from federal disposal regulations. Dispose of container and unused contents in accordance with federal, state and local requirements.

14. Transport Information

Not regulated.

WHMIS:

This MSDS has been prepared according to the hazard criteria of the Controlled Products Regulations (CPR) and the MSDS contains all of the information required by the CPR.

16. Other Information

NFPA Ratings: Health: 1 Flammability: 0 Reactivity: 0

Label Hazard Warning:

WARNING! HARMFUL IF SWALLOWED OR INHALED. CAUSES IRRITATION TO SKIN, EYES AND RESPIRATORY TRACT. AFFECTS THE LIVER.

Label Precautions:

Avoid contact with eyes, skin and clothing.

Wash thoroughly after handling.

Avoid breathing dust.

Keep container closed.

Use only with adequate ventilation.

Label First Aid:

If swallowed, induce vomiting immediately as directed by medical personnel. Never give anything by mouth to an unconscious person. If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. In case of contact, immediately flush eyes or skin with plenty of water for at least 15 minutes. Remove contaminated clothing and shoes. Wash clothing before reuse. In all cases, get medical attention.

Product Use:

Laboratory Reagent. Bulk pharmaceutical chemical. Food additive.

Revision Information:

No Changes.

MATERIAL SAFETY DATA SHEET

Prepared to U.S. OSHA, CMA, ANSI and Canadian WHMIS Standards

1. PRODUCT IDENTIFICATION

CHEMICAL NAME; CLASS: NON-FLAMMABLE GAS MIXTURE

Containing One or More of the Following Components in a Nitrogen Balance Gas: Oxygen, 0.0015-23.5%; Methane, 0.0005-2.5%; Carbon Monoxide, 0.0005-1.0%; Hydrogen Sulfide, 0.001-0.025%

SYNONYMS: Not Applicable

CHEMICAL FAMILY NAME: Not Applicable

FORMULA: Not Applicable

Document Number: 50018

Note: The Material Safety Data Sheet is for this gas mixture supplied in cylinders with 33 cubic feet (935 liters) or less gas capacity (DOT - 39 cylinders). This MSDS has been developed for various gas mixtures with the composition of components within the ranges listed in Section 2 (Composition and Information on Ingredients). Refer to the product label for information on the actual composition of the product.

PRODUCT USE:	Calibration of Monitoring and Research Equipment
SUPPLIER/MANUFACTURER'S NAME:	AIR LIQUIDE AMERICA CORPORATION

NOTE: All WHMIS required information is included. It is located in appropriate sections based on the ANSI Z400.1-1993 format.

3. HAZARD IDENTIFICATION

EMERGENCY OVERVIEW: This product is a colorless gas which has a rotten-egg odor (due to the presence of Hydrogen Sulfide). The odor cannot be relied on as an adequate warning of the presence of this product, because olfactory fatigue occurs after over-exposure to Hydrogen Sulfide. Hydrogen Sulfide and Carbon Monoxide (another component of this gas mixture) are toxic to humans in relatively low concentrations. Over-exposure to this gas mixture can cause skin or eye irritation, nausea, dizziness, headaches, collapse, unconsciousness, coma, and death. Additionally, releases of this product may produce oxygen-deficient atmospheres (especially in small confined spaces or other poorly-ventilated environments); individuals in such atmospheres may be asphyxiated.

SYMPTOMS OF OVER-EXPOSURE BY ROUTE OF EXPOSURE: The most significant route of over-exposure for this product is by inhalation.

INHALATION: Due to the small size of an individual cylinder of this product, no unusual health effects from over-exposure to the product are anticipated under routine circumstances of use. A potential health hazard associated with this product is the potential of inhalation of Hydrogen Sulfide, a component of this gas mixture. Such over-exposures may occur if this product is used in a confined space or other poorly-ventilated area. Over-exposures to Hydrogen Sulfide can cause dizziness, headache, and nausea. Over-exposure to this gas could result in respiratory arrest, coma, or unconsciousness, due to the presence of Hydrogen Sulfide. Continuous inhalation of low concentrations of Hydrogen Sulfide may cause olfactory fatigue, so that the odor is no longer an effective warning of the presence of this gas. A summary of exposure concentrations and observed effects are as follows:

CONCENTRATION OF HYDROGEN SULFIDE

0.3-30 ppm

50 ppm

Slightly higher than 50 ppm

100-150 ppm

200-250 ppm

300-500

500 ppm

> 600 ppm

> 1000 ppm

NOTE:

OBSERVED EFFECT

Odor is unpleasant.

Eye irritation. Dryness and irritation of nose, throat.

Irritation of the respiratory system.

Temporary loss of smell.

Headache, vomiting nausea. Prolonged exposure may lead to lung damage. Exposures of 4-8 hours can be fatal.

Swifter onset of symptoms. Death occurs in 1-4 hours.

Headache, excitement, staggering, and stomach ache after brief exposure. Death occurs within 0.5 - 1 hour of exposure.

Rapid onset of unconsciousness, coma, death.

Immediate respiratory arrest.

This product contains a maximum of 250 ppm Hydrogen Sulfide. The higher concentration values here are presented to delineate the complete health effects which have been observed for humans after exposure to Hydrogen Sulfide.

See Section 8

For routine industrial applications

3. HAZARD IDENTIFICATION (Continued)

Inhalation over-exposures to atmospheres containing more than the Threshold Limit Value of Carbon Monoxide (25 ppm), another component of this gas mixture, can result in serious health consequences. Carbon Monoxide is classified as a chemical asphyxiant, producing a toxic action by combining with the hemoglobin of the blood and replacing the available oxygen. Through this replacement, the body is deprived of the required oxygen, and asphyxiation occurs.

Since the affinity of Carbon Monoxide for hemoglobin is about 200-300 times that of oxygen, only a small amount of Carbon Monoxide will cause a toxic reaction to occur. Carbon Monoxide exposures in excess of 50 ppm will produce symptoms of poisoning if breathed for a sufficiently long time. If this product is released in a small, poorly ventilated area (i.e. an enclosed or confined space), symptoms which may develop include the following:

CONCENTRATION OF CARBON MONOXIDE

All exposure levels:

200 ppm:

400 ppm:

1,000 -2000 ppm:

200-2500 ppm:

>2500 ppm:

OBSERVED EFFECT

Over-exposure to Carbon Monoxide can be indicated by the lips and fingernails turning bright red.

Slight symptoms (i.e. headache) after several hours of exposure.

Headache and discomfort experienced within 2-3 hours of exposure.

Within 30 minutes, slight palpitations of the heart occurs. Within 1.5 hours, there is a tendency to stagger.

Within 2 hours, there is mental confusion, headaches, and nausea. Unconsciousness within 30 minutes.

Potential for collapse and death before warning symptoms.

Additionally, if mixtures of this product contain less than 19.5% Oxygen and are released in a small, poorly ventilated area (i.e. an enclosed or confined space), an oxygen-deficient environment may occur. Individuals breathing such an atmosphere may experience symptoms which include headaches, ringing in ears, dizziness, drowsiness, unconsciousness, nausea, vomiting, and depression of all the senses. Under some circumstances of over-exposure, death may occur. The following effects associated with various levels of oxygen are as follows:

CONCENTRATION OF OXYGEN

12-16% Oxygen:

10-14% Oxygen:

6-10% Oxygen:

Below 6%:

OBSERVED EFFECT

Breathing and pulse rate increased, muscular coordination slightly disturbed.

Emotional upset, abnormal fatigue, disturbed respiration.

Nausea, vomiting, collapse, or loss of consciousness.

Convulsive movements, possible respiratory collapse, and death.

SKIN and EYE CONTACT: Hydrogen Sulfide, a component of this gas mixture, may be irritating to the skin. Inflammation and irritation of the eyes can occur at very low airborne concentration of Hydrogen Sulfide (less than 10 ppm). Exposure over several hours may result in "gas eyes" or "sore eyes" with symptoms of scratchiness, irritation, tearing and burning. Above 50 ppm of Hydrogen Sulfide, there is an intense tearing, blurring of vision, and pain when looking at light. Over-exposed individuals may see rings around bright lights. Most symptoms disappear when exposure ceases. However, in serious cases, the eye can be permanently damaged.

HEALTH EFFECTS OR RISKS FROM EXPOSURE: An Explanation in Lay Terms. Over-exposure to this gas mixture may cause the following health effects:

ACUTE: Due to the small size of the individual cylinder of this product, no unusual health effects from exposure to the product are anticipated under routine circumstances of use. However, Hydrogen Sulfide and Carbon Monoxide (components of this gas mixture) are toxic to humans. Over-exposure to this gas mixture can cause nausea, dizziness, headaches, collapse, unconsciousness, coma, and death. Due to the presence of Hydrogen Sulfide, over-exposures to this gas mixture can also irritate the skin and eyes; severe eye contamination can result in blindness.

CHRONIC: Severe over-exposures to Hydrogen Sulfide, a component of this gas mixture, which do not result in death, may cause long-term symptoms such as memory loss, paralysis of facial muscles, or nerve tissue damage. In serious cases of over-exposure, the eyes can be permanently damaged. Skin disorders and respiratory conditions may be aggravated by repeated over-exposures to this gas product. Refer to Section 11 (Toxicology Information) for additional information on the components of this product.

TARGET ORGANS: Respiratory system, blood system, central nervous system effects, cardiovascular system, reproductive system, skin, eyes.

4. FIRST-AID MEASURES

RESCUERS SHOULD NOT ATTEMPT TO RETRIEVE VICTIMS OF EXPOSURE TO THIS PRODUCT WITHOUT ADEQUATE PERSONAL PROTECTIVE EQUIPMENT. At a minimum, Self-Contained Breathing Apparatus must be worn.

No unusual health effects are anticipated after exposure to this product, due to the small cylinder size. If any adverse symptom develops after over-exposure to this product, remove victim(s) to fresh air as quickly as possible. Only trained personnel should administer supplemental oxygen and/or cardio-pulmonary resuscitation if necessary.

SKIN EXPOSURE: If irritation of the skin develops after exposure to this gas mixture, immediately begin decontamination with running water. Minimum flushing is for 15 minutes. Remove exposed or contaminated clothing, taking care not to contaminate eyes. Victim must seek immediate medical attention.

EYE EXPOSURE: If irritation of the eye develops after exposure to this gas mixture, open victim's eyes while under gentle running water. Use sufficient force to open eyelids. Have victim "roll" eyes. Minimum flushing is for 15 minutes. Seek medical assistance immediately, preferably an ophthalmologist.

Victim(s) who experience any adverse effect after over-exposure to this product must be taken for medical attention. Rescuers should be taken for medical attention if necessary. Take a copy of the label and the MSDS to physician or other health professional with victim(s).

5. FIRE-FIGHTING MEASURES

FLASH POINT, (method): Not applicable.

AUTOIGNITION TEMPERATURE: Not applicable.

FLAMMABLE LIMITS (in air by volume, %):

Lower (LEL): Not applicable.

Upper (UEL): Not applicable.

FIRE EXTINGUISHING MATERIALS: Non-flammable gas mixture. Use extinguishing media appropriate for surrounding fire.

UNUSUAL FIRE AND EXPLOSION HAZARDS: This gas mixture contains toxic gases, Hydrogen Sulfide and Carbon Monoxide, and presents an health hazard to firefighters. This gas mixture is not flammable; however, containers, when involved in fire, may rupture or burst in the heat of the fire.

Explosion Sensitivity to Mechanical Impact: Not Sensitive.

Explosion Sensitivity to Static Discharge: Not Sensitive.

SPECIAL FIRE-FIGHTING PROCEDURES: Structural firefighters must wear Self-Contained Breathing Apparatus and full protective equipment.

6. ACCIDENTAL RELEASE MEASURES

LEAK RESPONSE: Due to the small size and content of the cylinder, an accidental release of this product presents significantly less risk of over-exposure to Hydrogen Sulfide and Carbon Monoxide, the toxic components of this product, and other safety hazards related to the remaining components of this product, than a similar release from a larger cylinder. However, as with any chemical release, extreme caution must be used during emergency response procedures. In the event of a release in which the atmosphere is unknown, and in which other chemicals are potentially involved, evacuate immediate area. Such releases should be responded to by trained personnel using pre-planned procedures. Proper protective equipment should be used. In case of a leak, clear the affected area, protect people, and respond with trained personnel.

For emergency disposal, secure the cylinder and slowly discharge the gas to the atmosphere in a well-ventilated area or outdoors. Allow the gas mixture to dissipate. If necessary, monitor the surrounding area (and the original area of the release) for Hydrogen Sulfide, Carbon Monoxide, and Oxygen. Hydrogen Sulfide and Carbon Monoxide level must be below exposure level listed in Section 2 (Composition and Information on Ingredients) and Oxygen levels must be above 19.5% before non-emergency personnel are allowed to re-enter area.

If leaking incidentally from the cylinder, contact your supplier.

7. HANDLING and USE

WORK PRACTICES AND HYGIENE PRACTICES: Be aware of any signs of dizziness or fatigue, especially if work is done in a poorly ventilated area; exposures to fatal concentrations of this product could occur without any significant warning symptoms, due to olfactory fatigue or oxygen deficiency. Do not attempt to repair, adjust, or in any other way modify cylinders containing a gas mixture with Hydrogen Sulfide or Carbon Monoxide. If there is a malfunction or another type of operational problem, contact nearest distributor immediately. Eye wash stations/safety showers should be near areas where this product is used or stored. All work operations should be monitored in such a way that emergency personnel can be immediately contacted in the event of a release. All work practices should minimize releases of Hydrogen Sulfide and Carbon Monoxide-containing gas mixtures.

STORAGE AND HANDLING PRACTICES: Cylinders should be firmly secured to prevent falling or being knocked-over. Cylinders must be protected from the environment, and preferably kept at room temperature (approximately 21°C, 70°F). Cylinders should be stored in dry, well-ventilated areas, away from sources of heat, ignition, and direct sunlight. Protect cylinders against physical damage.

Full and empty cylinders should be segregated. Use a first-in, first-out inventory system to prevent full containers from being stored for long periods of time. These cylinders are not refillable. **WARNING! Do not refill DOT 39 cylinders. To do so may cause personal injury or property damage.**

SPECIAL PRECAUTIONS FOR HANDLING GAS CYLINDERS: WARNING! Compressed gases can present significant safety hazards. During cylinder use, use equipment designed for these specific cylinders. Ensure all lines and equipment are rated for proper service pressure.

PROTECTIVE PRACTICES DURING MAINTENANCE OF CONTAMINATED EQUIPMENT: Follow practices indicated in Section 6 (Accidental Release Measures). Make certain that application equipment is locked and tagged-out safely. Always use product in areas where adequate ventilation is provided.

8. EXPOSURE CONTROLS - PERSONAL PROTECTION

VENTILATION AND ENGINEERING CONTROLS: No special ventilation systems or engineering controls are needed under normal circumstances of use. As with all chemicals, use this product in well-ventilated areas. If this product is used in a poorly-ventilated area, install automatic monitoring equipment to detect the levels of Oxygen, Hydrogen Sulfide, and Carbon Monoxide.

RESPIRATORY PROTECTION: No special respiratory protection is required under normal circumstances of use. Use supplied air respiratory protection if Carbon Monoxide levels exceed the exposure levels given in Section 2 (Composition and Information on Ingredients) or if oxygen levels are below 19.5%, or if either level is unknown during emergency response to a release of this product. If respiratory protection is required for emergency response to this product, follow the requirements of the Federal OSHA Respiratory Protection Standard (29 CFR 1910.134) or equivalent State standards. The following NIOSH respiratory protection recommendations for Hydrogen Sulfide and Carbon Monoxide are provided for further information.

NIOSH/OSHA RECOMMENDATIONS FOR HYDROGEN SULFIDE CONCENTRATIONS IN AIR:

UP TO 100 ppm: Powered air-purifying respirator with cartridge(s) to protect against hydrogen sulfide; gas mask with canister to protect against hydrogen sulfide; or SAR; or full-facepiece SCBA.

Emergency or Planned Entry into Unknown Concentration or IDLH Conditions: Positive pressure, full-facepiece SCBA; or positive pressure, full-facepiece SAR with an auxiliary positive pressure SCBA.

Escape: Gas mask with canister to protect against hydrogen sulfide; or escape-type SCBA

NOTE: The IDLH concentration for Hydrogen Sulfide is 100 ppm.

NIOSH/OSHA RECOMMENDATIONS FOR CARBON MONOXIDE CONCENTRATIONS IN AIR:

UP TO 350 ppm Supplied Air Respirator (SAR)

UP TO 875 ppm Supplied Air Respirator (SAR) operated in a continuous flow mode.

UP TO 1200 ppm Gas mask with canister to protect against carbon monoxide; or full-facepiece SCBA; or full-facepiece Supplied Air Respirator (SAR).

Emergency or Planned Entry into Unknown Concentration or IDLH Conditions: Positive pressure, full-facepiece SCBA; or positive pressure, full-facepiece Supplied Air Respirator (SAR) with an auxiliary positive pressure SCBA.

Escape: Gas mask with canister to protect against carbon monoxide; or escape-type SCBA.

NOTE: End of Service Life Indicator (ESLI) required for gas masks.

NOTE: The IDLH concentration for Carbon Monoxide is 1200 ppm.

EYE PROTECTION: Safety glasses.

HAND PROTECTION: No special protection is needed under normal circumstances of use.

BODY PROTECTION: No special protection is needed under normal circumstances of use.

9. PHYSICAL and CHEMICAL PROPERTIES

Unless otherwise specified, the following information is for Nitrogen, the main component of this gas mixture.

GAS DENSITY @ 32°F (0°C) and 1 atm: .072 lbs/ ft³ (1.153 kg/m³)

BOILING POINT: -320.4°F (-195.8°C)

FREEZING/MELTING POINT @ 10 psig: -345.8°F (-210°C)

SPECIFIC GRAVITY (air = 1) @ 70°F (21.1°C): 0.906

pH: Not applicable.

SOLUBILITY IN WATER vol/vol @ 32°F (0°C) and 1 atm: 0.023

MOLECULAR WEIGHT: 28.01

EVAPORATION RATE (nBuAc = 1): Not applicable.

EXPANSION RATIO: Not applicable.

ODOR THRESHOLD: 0.13 ppm (Hydrogen Sulfide)

SPECIFIC VOLUME (ft³/lb): 13.8

VAPOR PRESSURE @ 70°F (21.1°C) (psig): Not applicable.

COEFFICIENT WATER/OIL DISTRIBUTION: Not applicable.

APPEARANCE AND COLOR: This product is a colorless gas which has an rotten egg-like odor, due to the presence of Hydrogen Sulfide.

HOW TO DETECT THIS SUBSTANCE (warning properties): Continuous inhalation of low concentrations of Hydrogen Sulfide (a component of this gas mixture) may cause olfactory fatigue, so that there are no distinct warning properties. In terms of leak detection, fittings and joints can be painted with a soap solution to detect leaks, which will be indicated by a bubble formation. Wet lead acetate paper can be used for leak detection. The paper turns black in the presence of Hydrogen Sulfide. Cadmium chloride solutions can also be used. Cadmium solutions will turn yellow upon contact with Hydrogen Sulfide.

10. STABILITY and REACTIVITY

STABILITY: Normally stable in gaseous state.

DECOMPOSITION PRODUCTS: The thermal decomposition products of Methane include carbon oxides. The decomposition products of Hydrogen Sulfide include water and sulfur oxides. The other components of this gas mixture do not decompose, per se, but can react with other compounds in the heat of a fire.

MATERIALS WITH WHICH SUBSTANCE IS INCOMPATIBLE: Titanium will burn in Nitrogen (the main component of this product). Lithium reacts slowly with Nitrogen at ambient temperatures. Components of this product (Hydrogen Sulfide, Methane) are also incompatible with strong oxidizers (i.e. chlorine, bromine pentafluoride, oxygen, oxygen difluoride, and nitrogen trifluoride). Carbon Monoxide is mildly corrosive to nickel and iron (especially at high temperatures and pressures). Hydrogen Sulfide is corrosive to most metals, because it reacts with these substances to form metal sulfides.

HAZARDOUS POLYMERIZATION: Will not occur.

CONDITIONS TO AVOID: Contact with incompatible materials. Cylinders exposed to high temperatures or direct flame can rupture or burst.

11. TOXICOLOGICAL INFORMATION

TOXICITY DATA: The following toxicology data are available for the components of this product:

NITROGEN: There are no specific toxicology data for Nitrogen. Nitrogen is a simple asphyxiant, which acts to displace oxygen in the environment.

METHANE: There are no specific toxicology data for Methane. Methane is a simple asphyxiant, which acts to displace oxygen in the environment.

HYDROGEN SULFIDE:

LCLo (inhalation, human) = 600 ppm/30 minutes

LDLO (inhalation, man) = 5.7 mg/kg; central nervous system, pulmonary effects

LCLo (inhalation, human) = 800 ppm/5 minutes

LC₅₀ (inhalation, rat) = 444 ppm

LC₅₀ (inhalation, mouse) = 673 ppm/1 hour

LCLo (inhalation, mammal) = 800 ppm/5 minutes

CARBON MONOXIDE:

TCLo (inhalation, mouse) = 65 ppm/24 hours (7-18 preg): rep. effects

TCLo (inhalation, mouse) = 8 pph/1 hour (female 8D post): ter. effects

TCLo (inhalation, human) = 600 mg/m³/10 minutes

LCLo (inhalation, man) = 4000 ppm/30 minutes

TCLo (inhalation, man) = 650 ppm/45 minutes: central nervous system and blood system effects.

LCLo (inhalation, human) = 5000 ppm/5 minutes

LCLo (inhalation, dog) = 4000 ppm/46 minutes

LCLo (inhalation, rabbit) = 4000 ppm

LC₅₀ (inhalation, rat) = 1811 ppm/4 hours

LC₅₀ (inhalation, guinea pig) = 2450 ppm/4 hours

LC₅₀ (inhalation, guinea pig) = 5718 ppm/4 hours

LCLo (inhalation, mammal) = 5000 ppm/5 minutes

LD₅₀ (inhalation, wild bird) = 1334 ppm

11. TOXICOLOGICAL INFORMATION (Continued)

SUSPECTED CANCER AGENT: The components of this gas mixture are not found on the following lists: FEDERAL OSHA Z LIST, NTP, CAL/OSHA, and IARC; therefore, they are not considered to be, nor suspected to be, cancer-causing agents by these agencies.

IRRITANCY OF PRODUCT: Hydrogen Sulfide, a component of this gas mixture, is irritating to the eyes, and may be irritating to the skin.

SENSITIZATION OF PRODUCT: The components of this gas mixture are not known to be skin or respiratory sensitizers.

REPRODUCTIVE TOXICITY INFORMATION: Listed below is information concerning the effects of this gas mixture on the human reproductive system.

Mutagenicity: This gas mixture is not expected to cause mutagenic effects in humans.

Embryotoxicity: This gas mixture contains components that may cause embryotoxic effects in humans; however, due to the small total amount of the components, embryotoxic effects are not expected to occur.

Teratogenicity: This gas mixture is not expected to cause teratogenic effects in humans due to the small cylinder size and small total amount of all components. Carbon Monoxide, a component of this gas mixture which exists up to 1%, can cause teratogenic effects in humans. Severe exposure to Carbon Monoxide during pregnancy has caused adverse effects and the death of the fetus. In general, maternal symptoms are an indicator of the potential risk to the fetus since Carbon Monoxide is toxic to the mother before it is toxic to the fetus.

Reproductive Toxicity: This gas mixture is not expected to cause adverse reproductive effects in humans.

A mutagen is a chemical which causes permanent changes to genetic material (DNA) such that the changes will propagate through generation lines. An embryotoxin is a chemical which causes damage to a developing embryo (i.e. within the first eight weeks of pregnancy in humans), but the damage does not propagate across generational lines. A teratogen is a chemical which causes damage to a developing fetus, but the damage does not propagate across generational lines. A reproductive toxin is any substance which interferes in any way with the reproductive process.

MEDICAL CONDITIONS AGGRAVATED BY EXPOSURE: Pre-existing respiratory conditions may be aggravated by over-exposure to this product. Carbon Monoxide, a component of this gas mixture, can aggravate some diseases of the cardiovascular system, such as coronary artery disease and angina pectoris. Because of the presence of Hydrogen Sulfide, eye disorders or skin problems may be aggravated by over-exposure to this product.

RECOMMENDATIONS TO PHYSICIANS: Treat symptoms and eliminate over-exposure. Hyperbaric oxygen is the most efficient antidote to Carbon Monoxide poisoning, the optimum range being 2-2.5 atm. A special mask, or, preferably, a compression chamber to utilize oxygen at these pressures is required. Avoid administering stimulant drugs. Be observant for initial signs of pulmonary edema in the event of severe inhalation over-exposures.

BIOLOGICAL EXPOSURE INDICES (BEIs): Biological Exposure Indices (BEIs) are applicable for this product, as follows:

BIOLOGICAL EXPOSURE INDICES (BEIs) for components of this product are as follows:		
CHEMICAL DETERMINANT	SAMPLING TIME	BEI
CARBON MONOXIDE • Carboxyhemoglobin in blood • Carbon monoxide in end-exhaled air	• End of shift • End of shift	• 3.5% of hemoglobin • 20 ppm

12. ECOLOGICAL INFORMATION

ENVIRONMENTAL STABILITY: The gas will be dissipated rapidly in well-ventilated areas. The following environmental data are applicable to the components of this product.

HYDROGEN SULFIDE: Water Solubility = 1 g/242 mL at 20°C.

CARBON MONOXIDE: Water solubility = 3.3 ml/100 cc at 0 °C, 2.3 ml at 20°C.

NITROGEN: Water Solubility = 2.4 volumes Nitrogen/100 volumes water at 0°C; 1.6 volumes Nitrogen/100 volumes water at 20°C.

EFFECT OF MATERIAL ON PLANTS or ANIMALS: No evidence is currently available on this product's effects on plant and animal life. Hydrogen Sulfide and Carbon Monoxide, components of this product, can be deadly to exposed animal life, producing symptoms similar to those experienced by humans. This gas mixture may also be harmful to plant life.

12. ECOLOGICAL INFORMATION (Continued)

EFFECT OF CHEMICAL ON AQUATIC LIFE: No evidence is currently available on this product's effects on aquatic life. The presence of more than a trace of Carbon Monoxide (a component of this product) is a hazard to fish. The following aquatic toxicity data are available for Hydrogen Sulfide (another component of this gas mixture):

TLm (Asellus sp) = 0.111 mg/L/96 hour

TLm (Cranfongyx sp) = 1.07 mg/L/96 hour

TLm (Gammarrus) = 0.84 mg/L/96 hour

LC₅₀ (fly inhalation) = 380 mg/m³/960 minutes

LC₅₀ (fly inhalation) = 1500 mg/m³/7 minutes

TLm (Lepomis macrochirus, bluegill sunfish) = 0.0478 mg/L/96 hour

TLm (Lepomis macrochirus, bluegill sunfish) = 0.0448 mg/L/96 hour at 21-22 °C

TLm (Pimephales promelas, fathead minnow) = 0.0071-0.55 mg/L/96 hour

TLm (Salvelinus fontinalis, brook trout) = 0.0216-0.038 mg/L/96 hour at 8-12.5 °C

13. DISPOSAL CONSIDERATIONS

PREPARING WASTES FOR DISPOSAL: Waste disposal must be in accordance with appropriate Federal, State, and local regulations. Cylinders with undesired residual product may be safely vented outdoors with the proper regulator. For further information, refer to Section 16 (Other Information).

14. TRANSPORTATION INFORMATION

THIS MATERIAL IS HAZARDOUS AS DEFINED BY 49 CFR 172.101 BY THE U.S. DEPARTMENT OF TRANSPORTATION.

PROPER SHIPPING NAME: Compressed gases, n.o.s. (Nitrogen, Hydrogen Sulfide)

HAZARD CLASS NUMBER and DESCRIPTION: 2.2 (Non-Flammable Gas)

UN IDENTIFICATION NUMBER: UN 1956

PACKING GROUP: Not applicable.

DOT LABEL(S) REQUIRED: Non-Flammable Gas

NORTH AMERICAN EMERGENCY RESPONSE GUIDEBOOK NUMBER (1996): 126

MARINE POLLUTANT: The components of this gas mixture are not classified by the DOT as Marine Pollutants (as defined by 49 CFR 172.101, Appendix B).

SPECIAL SHIPPING INFORMATION: Cylinders should be transported in a secure position, in a well-ventilated vehicle. The transportation of compressed gas cylinders in automobiles or in closed-body vehicles can present serious safety hazards. If transporting these cylinders in vehicles, ensure these cylinders are not exposed to extremely high temperatures (as may occur in an enclosed vehicle on a hot day). Additionally, the vehicle should be well-ventilated during transportation.

Note: DOT 39 Cylinders ship in a strong outer carton (overpack). Pertinent shipping information goes on the outside of the overpack. DOT 39 Cylinders do not have transportation information on the cylinder itself.

TRANSPORT CANADA TRANSPORTATION OF DANGEROUS GOODS REGULATIONS: THIS MATERIAL IS CONSIDERED AS DANGEROUS GOODS. Use the above information for the preparation of Canadian Shipments.

15. REGULATORY INFORMATION

SARA REPORTING REQUIREMENTS: This product is subject to the reporting requirements of Sections 302, 304, and 313 of Title III of the Superfund Amendments and Reauthorization Act, as follows:

COMPONENT	SARA 302	SARA 304	SARA 313
Oxygen	NO	NO	NO
Methane	NO	NO	NO
Carbon Monoxide	NO	NO	NO
Nitrogen	NO	NO	NO
Hydrogen Sulfide	YES	YES	YES

SARA THRESHOLD PLANNING QUANTITY: Hydrogen Sulfide = 500 lbs.

TSCA INVENTORY STATUS: The components of this gas mixture are listed on the TSCA Inventory.

CERCLA REPORTABLE QUANTITY (RQ): Hydrogen Sulfide = 100 lbs.

OTHER U.S. FEDERAL REGULATIONS:

- Hydrogen Sulfide and Carbon Monoxide are subject to the reporting requirements of CFR 29 1910.1000.

- Hydrogen Sulfide and Methane are subject to the reporting requirements of Section 112(r) of the Clean Air Act. The Threshold Quantity for each of these gases is 10,000 pounds and so this mixture will not be affected by the regulation.

15. REGULATORY INFORMATION (Continued)

OTHER U.S. FEDERAL REGULATIONS (Continued):

- Depending on specific operations involving the use of this gas mixture, the regulations of the Process Safety Management of Highly Hazardous Chemicals may be applicable (29 CFR 1910.119). Hydrogen Sulfide is listed in Appendix A of this regulation. The Threshold Quantity for Hydrogen Sulfide under this regulation is 1500 lbs (and so one cylinder of this product will not be affected by this regulation).
- This gas mixture does not contain any Class I or Class II ozone depleting chemicals (40 CFR part 82).
- Nitrogen and Oxygen are not listed Regulated Substances, per 40 CFR, Part 68, of the Risk Management for Chemical Releases. Hydrogen Sulfide is listed under this regulation in Table 1 as a Regulated Substance (Toxic Substance), in quantities of 10,000 lbs (4,553 kg) or greater. Carbon Monoxide and Methane are listed under this regulation in Table 3, as Regulated Substances (Flammable), in quantities of 10,000 lbs (4,553 kg) or greater, and so this mixture will not be affected by the regulation.

OTHER CANADIAN REGULATIONS: This gas mixture is categorized as a Controlled Product, Hazard Classes A and D2A, as per the Controlled Product Regulations.

STATE REGULATORY INFORMATION: The components of this gas mixture are covered under the following specific State regulations:

Alaska - Designated Toxic and Hazardous Substances: Carbon Monoxide, Hydrogen Sulfide, Methane.

California - Permissible Exposure Limits for Chemical Contaminants: Carbon Monoxide, Nitrogen, Hydrogen Sulfide, Methane.

Florida - Substance List: Oxygen, Carbon Monoxide, Hydrogen Sulfide

Illinois - Toxic Substance List: Carbon Monoxide, Methane, Hydrogen Sulfide.

Kansas - Section 302/313 List: No.

Massachusetts - Substance List: Oxygen, Carbon Monoxide, Hydrogen Sulfide, Methane.

Minnesota - List of Hazardous Substances: Carbon Monoxide, Hydrogen Sulfide, Methane.

Missouri - Employer Information/Toxic Substance List t: Hydrogen Sulfide, Methane.

New Jersey - Right to Know Hazardous Substance List: Oxygen, Carbon Monoxide, Nitrogen, Methane.

North Dakota - List of Hazardous Chemicals, Reportable Quantities: Hydrogen Sulfide.

Pennsylvania - Hazardous Substance List: Oxygen, Carbon Monoxide, Nitrogen, Hydrogen Sulfide, Methane.

Rhode Island - Hazardous Substance List: Oxygen, Carbon Monoxide, Nitrogen, Hydrogen Sulfide, Methane.

Texas - Hazardous Substance List: Hydrogen Sulfide.

West Virginia - Hazardous Substance List: Hydrogen Sulfide.

Wisconsin - Toxic and Hazardous Substances: Hydrogen Sulfide

CALIFORNIA PROPOSITION 65: Carbon Monoxide (a component of this product) is on the California Proposition 65 lists as a chemical known to the State of California to cause birth defects or other reproductive harm.

16. OTHER INFORMATION

INFORMATION ABOUT DOT-39 NRC (Non-Refillable Cylinder) PRODUCTS

DOT 39 cylinders ship as hazardous materials when full. Once the cylinders are relieved of pressure (empty) they are not considered hazardous material or waste. Residual gas in this type of cylinder is not an issue because toxic gas mixtures are prohibited. Calibration gas mixtures typically packaged in these cylinders are Nonflammable n.o.s., UN 1956. A small percentage of calibration gases packaged in DOT 39 cylinders are flammable or oxidizing gas mixtures.

For disposal of used DOT-39 cylinders, it is acceptable to place them in a landfill if local laws permit. Their disposal is no different than that employed with other DOT containers such as spray paint cans, household aerosols, or disposable cylinders of propane (for camping, torch etc.). When feasible, we recommended recycling for scrap metal content. Air Liquide America will do this for any customer that wishes to return cylinders to us prepaid. All that is required is a phone call to make arrangements so we may anticipate arrival. Scrapping cylinders involves some preparation before the metal dealer may accept them. We perform this operation as a service to valued customers who want to participate.

16. OTHER INFORMATION (Continued)

MIXTURES: When two or more gases or liquefied gases are mixed, their hazardous properties may combine to create additional, unexpected hazards. Obtain and evaluate the safety information for each component before you produce the mixture. Consult an Industrial Hygienist or other trained person when you make your safety evaluation of the end product. Remember, gases and liquids have properties which can cause serious injury or death.

Further information about the handling of compressed gases can be found in the following pamphlets published by: Compressed Gas Association Inc. (CGA), 1725 Jefferson Davis Highway, Suite 1004, Arlington, VA 22202-4102. Telephone: (703) 412-0900.

Fax on Demand: 1-800/231-1366

This Material Safety Data Sheet is offered pursuant to OSHA's Hazard Communication Standard, 29 CFR, 1910.1200. Other government regulations must be reviewed for applicability to this product. To the best of Air Liquide America Corporation's knowledge, the information contained herein is reliable and accurate as of this date; however, accuracy, suitability or completeness are not guaranteed and no warranties of any type, either express or implied, are provided. The information contained herein relates only to this specific product. If this product is combined with other materials, all component properties must be considered. Data may be changed from time to time. Be sure to consult the latest edition.

**AIR LIQUIDE**

MATERIAL SAFETY DATA SHEET

Prepared to U.S. OSHA, CMA, ANSI and Canadian WHMIS Standards

1. PRODUCT IDENTIFICATION

CHEMICAL NAME; CLASS: NON-FLAMMABLE GAS MIXTURE

Containing One or More of the Following Components in a Nitrogen Balance Gas:
Oxygen 0-23.5%; Isobutylene, 0.0005-0.9%

SYNONYMS: Not Applicable

CHEMICAL FAMILY NAME: Not Applicable

FORMULA: Not Applicable

Document Number: 50054

Note: The Material Safety Data Sheet is for this gas mixture supplied in cylinders with 33 cubic feet (935 liters) or less gas capacity (DOT - 39 cylinders). This MSDS has been developed for various gas mixtures with the composition of components within the ranges listed in Section 2 (Composition and Information on Ingredients). Refer to the product label for information on the actual composition of the product.

PRODUCT USE:	Calibration of Monitoring and Research Equipment
SUPPLIER/MANUFACTURER'S NAME:	AIR LIQUIDE AMERICA CORPORATION
ADDRESS:	821 Chesapeake Drive Cambridge, MD 21613
EMERGENCY PHONE:	CHEMTREC: 1-800-424-9300
BUSINESS PHONE:	1-410-228-6400 General MSDS Information 1-713/868-0440 Fax on Demand: 1-800/231-1366

2. COMPOSITION and INFORMATION ON INGREDIENTS

CHEMICAL NAME	CAS #	mole %	EXPOSURE LIMITS IN AIR					
			ACGIH		OSHA			OTHER
			TLV ppm	STEL ppm	PEL ppm	STEL ppm	IDLH ppm	
Oxygen	7782-44-7	0 - 23.5%	There are no specific exposure limits for Oxygen.					
Isobutylene	115-11-7	0.0005 - 0.9%	There are no specific exposure limits for Isobutylene.					
Nitrogen	7727-37-9	Balance	There are no specific exposure limits for Nitrogen. Nitrogen is a simple asphyxiant (SA). Oxygen levels should be maintained above 19.5%.					

NE = Not Established.

C = Ceiling Limit.

See Section 16 for Definitions of Terms Used.

NOTE : All WHMIS required information is included. It is located in appropriate sections based on the ANSI Z400.1-1993 format.

3. HAZARD IDENTIFICATION

EMERGENCY OVERVIEW: This product is a colorless, odorless gas. Releases of this product may produce oxygen-deficient atmospheres (especially in confined spaces or other poorly-ventilated environments); individuals in such atmospheres may be asphyxiated. Isobutylene, a component of this gas mixture, may cause drowsiness and other central nervous system effects in high concentrations; however, due to its low concentration in this gas mixture, this is unlikely to occur.

SYMPTOMS OF OVER-EXPOSURE BY ROUTE OF EXPOSURE: The most significant route of over-exposure for this product is by inhalation.

INHALATION: Due to the small size of an individual cylinder of this product, no unusual health effects from over-exposure to the product are anticipated under routine circumstances of use. The chief health hazard associated with this gas mixture is when this product contains less than 19.5% Oxygen and is released in a small, poorly-ventilated area (i.e. an enclosed or confined space). Under this circumstance, an oxygen-deficient environment may occur. Individuals breathing such an atmosphere may experience symptoms which include headaches, ringing in ears, dizziness, drowsiness, unconsciousness, nausea, vomiting, and depression of all the senses. Under some circumstances of over-exposure, death may occur. The effects associated with various levels of oxygen are as follows:

CONCENTRATION OF OXYGEN

OBSERVED EFFECT

12-16% Oxygen:	Breathing and pulse rate increase, muscular coordination slightly disturbed.
10-14% Oxygen:	Emotional upset, abnormal fatigue, disturbed respiration.
6-10% Oxygen:	Nausea, vomiting, collapse, or loss of consciousness.
Below 6%:	Convulsive movements, possible respiratory collapse, and death.

HEALTH EFFECTS OR RISKS FROM EXPOSURE: An Explanation in Lay Terms. Over-exposure to this gas mixture may cause the following health effects:

ACUTE: Due to the small size of the individual cylinder of this product, no unusual health effects from exposure to the product are anticipated under routine circumstances of use. The most significant hazard associated with this gas mixture when it contains less than 19.5% oxygen is the potential for exposure to oxygen-deficient atmospheres. Symptoms of oxygen deficiency include respiratory difficulty, ringing in ears, headaches, shortness of breath, wheezing, headache, dizziness, indigestion, nausea, unconsciousness, and death. The skin of a victim of over-exposure may have a blue color. Additionally, Isobutylene, a component of this gas mixture, may cause drowsiness or central nervous system effects in high concentrations; however, due to its low concentration in this gas mixture, this is unlikely to occur.

CHRONIC: There are currently no known adverse health effects associated with chronic exposure to this gas mixture.

TARGET ORGANS: Respiratory system.

HAZARDOUS MATERIAL INFORMATION SYSTEM			
HEALTH		(BLUE)	1
FLAMMABILITY		(RED)	0
REACTIVITY		(YELLOW)	0
PROTECTIVE EQUIPMENT			B
EYES	RESPIRATORY	HANDS	BODY
See Section 8			
For routine industrial applications			

4. FIRST-AID MEASURES

RESCUERS SHOULD NOT ATTEMPT TO RETRIEVE VICTIMS OF EXPOSURE TO THIS PRODUCT WITHOUT ADEQUATE PERSONAL PROTECTIVE EQUIPMENT. At a minimum, Self-Contained Breathing Apparatus must be worn.

No unusual health effects are anticipated after exposure to this product, due to the small cylinder size. If any adverse symptom develops after over-exposure to this product, remove victim(s) to fresh air as quickly as possible. Only trained personnel should administer supplemental oxygen and/or cardio-pulmonary resuscitation if necessary.

4. FIRST-AID MEASURES (Continued)

Victim(s) who experience any adverse effect after over-exposure to this product must be taken for medical attention. Rescuers should be taken for medical attention if necessary. Take a copy of the label and the MSDS to physician or other health professional with victim(s).

5. FIRE-FIGHTING MEASURES

FLASH POINT, (method): Not applicable.

AUTOIGNITION TEMPERATURE: Not applicable.

FLAMMABLE LIMITS (in air by volume, %):

Lower (LEL): Not applicable.

Upper (UEL): Not applicable.

FIRE EXTINGUISHING MATERIALS: Non-flammable gas mixture. Use extinguishing media appropriate for surrounding fire.

UNUSUAL FIRE AND EXPLOSION HAZARDS: This gas mixture is not flammable; however, containers, when involved in fire, may rupture or burst in the heat of the fire.

Explosion Sensitivity to Mechanical Impact: Not sensitive.

Explosion Sensitivity to Static Discharge: Not sensitive.

SPECIAL FIRE-FIGHTING PROCEDURES: Structural firefighters must wear Self-Contained Breathing Apparatus and full protective equipment.

6. ACCIDENTAL RELEASE MEASURES

LEAK RESPONSE: Due to the small size and content of the cylinder, an accidental release of this product presents significantly less risk of an oxygen deficient environment and other safety hazards than a similar release from a larger cylinder. However, as with any chemical release, extreme caution must be used during emergency response procedures. In the event of a release in which the atmosphere is unknown, and in which other chemicals are potentially involved, evacuate immediate area. Such releases should be responded to by trained personnel using pre-planned procedures. Proper protective equipment should be used. In case of a leak, clear the affected area, protect people, and respond with trained personnel.

Allow the gas mixture to dissipate. If necessary, monitor the surrounding area (and the original area of the release) for oxygen. Oxygen levels must be above 19.5% before non-emergency personnel are allowed to re-enter area.

If leaking incidentally from the cylinder, contact your supplier.

7. HANDLING and USE

WORK PRACTICES AND HYGIENE PRACTICES: Be aware of any signs of dizziness or fatigue, especially if work is done in a poorly-ventilated area; exposures to fatal concentrations of this product could occur without any significant warning symptoms, due to oxygen deficiency. Do not attempt to repair, adjust, or in any other way modify cylinders containing this gas mixture. If there is a malfunction or another type of operational problem, contact nearest distributor immediately.

STORAGE AND HANDLING PRACTICES: Cylinders should be firmly secured to prevent falling or being knocked-over. Cylinders must be protected from the environment, and preferably kept at room temperature (approximately 21°C; 70°F). Cylinders should be stored in dry, well-ventilated areas, away from sources of heat, ignition, and direct sunlight. Protect cylinders against physical damage.

Full and empty cylinders should be segregated. Use a first-in, first-out inventory system to prevent full containers from being stored for long periods of time. These cylinders are not refillable. **WARNING! Do not refill DOT 39 cylinders. To do so may cause personal injury or property damage.**

SPECIAL PRECAUTIONS FOR HANDLING GAS CYLINDERS: WARNING! Compressed gases can present significant safety hazards. During cylinder use, use equipment designed for these specific cylinders. Ensure all lines and equipment are rated for proper service pressure.

PROTECTIVE PRACTICES DURING MAINTENANCE OF CONTAMINATED EQUIPMENT: Follow practices indicated in Section 6 (Accidental Release Measures). Make certain that application equipment is locked and tagged-out safely. Always use product in areas where adequate ventilation is provided.

8. EXPOSURE CONTROLS - PERSONAL PROTECTION

VENTILATION AND ENGINEERING CONTROLS: No special ventilation systems or engineering controls are needed under normal circumstances of use. As with all chemicals, use this product in well-ventilated areas. If this product is used in a poorly-ventilated area, install automatic monitoring equipment to detect the levels of oxygen.

RESPIRATORY PROTECTION: No special respiratory protection is required under normal circumstances of use. Use supplied air respiratory protection if oxygen levels are below 19.5% or unknown during emergency response to a release of this product. If respiratory protection is required for emergency response to this product, follow the requirements of the Federal OSHA Respiratory Protection Standard (29 CFR 1910.134) or equivalent State standards.

EYE PROTECTION: Safety glasses.

HAND PROTECTION: No special protection is needed under normal circumstances of use.

BODY PROTECTION: No special protection is needed under normal circumstances of use.

9. PHYSICAL and CHEMICAL PROPERTIES

Unless otherwise specified, the following information is for Nitrogen, the main component of this gas mixture.

GAS DENSITY @ 32°F (0°C) and 1 atm: 0.072 lbs/ ft³ (1.153 kg/m³)

BOILING POINT: -195.8°C (-320.4 °F)

FREEZING/MELTING POINT @ 10 psig -210°C (-345.8°F)

SPECIFIC GRAVITY (air = 1) @ 70°F (21.1°C): 0.906

pH: Not applicable.

SOLUBILITY IN WATER vol/vol @ 32°F (0°C) and 1 atm: 0.023

MOLECULAR WEIGHT: 28.01

EVAPORATION RATE (nBuAc = 1): Not applicable.

EXPANSION RATIO: Not applicable.

ODOR THRESHOLD: Not applicable.

SPECIFIC VOLUME (ft³/lb): 13.8

VAPOR PRESSURE @ 70°F (21.1°C) psig: Not applicable.

COEFFICIENT WATER/OIL DISTRIBUTION: Not applicable.

The following information is for this gas mixture.

APPEARANCE AND COLOR: This product is a colorless, odorless gas.

HOW TO DETECT THIS SUBSTANCE (warning properties): There are no unusual warning properties associated with a release of this product.

10. STABILITY and REACTIVITY

STABILITY: Normally stable in gaseous state.

DECOMPOSITION PRODUCTS: The thermal decomposition products of Isobutylene include carbon oxides. The other components of this gas mixture do not decompose, per se, but can react with other compounds in the heat of a fire.

MATERIALS WITH WHICH SUBSTANCE IS INCOMPATIBLE: Titanium will burn in Nitrogen (the main component of this product). Lithium reacts slowly with Nitrogen at ambient temperatures. A component of this product (Isobutylene) are also incompatible with strong oxidizers (i.e. chlorine, bromine pentafluoride, oxygen difluoride, and nitrogen trifluoride).

HAZARDOUS POLYMERIZATION: Will not occur.

CONDITIONS TO AVOID: Contact with incompatible materials. Cylinders exposed to high temperatures or direct flame can rupture or burst.

11. TOXICOLOGICAL INFORMATION

TOXICITY DATA: The following toxicology data are available for the components of this product:

NITROGEN: There are no specific toxicology data for Nitrogen. Nitrogen is a simple asphyxiant, which acts to displace oxygen in the environment.

ISOBUTYLENE:
LC₅₀ (inhalation, rat) = 620,000 mg/kg/4 hours
LC₅₀ (inhalation, mouse) = 415,000 mg/kg

11. TOXICOLOGICAL INFORMATION (Continued)

SUSPECTED CANCER AGENT: The components of this gas mixture are not found on the following lists: FEDERAL OSHA Z LIST, NTP, CAL/OSHA, and IARC; therefore, they are not considered to be, nor suspected to be, cancer-causing agents by these agencies.

IRRITANCY OF PRODUCT: Not applicable.

SENSITIZATION TO THE PRODUCT: This gas mixture is not known to cause sensitization in humans.

REPRODUCTIVE TOXICITY INFORMATION: Listed below is information concerning the effects of this product and its components on the human reproductive system.

Mutagenicity: No mutagenicity effects have been described for this gas mixture.

Embryotoxicity: No embryotoxic effects have been described for this gas mixture.

Teratogenicity: No teratogenicity effects have been described for this gas mixture.

Reproductive Toxicity: No reproductive toxicity effects have been described for gas mixture.

A mutagen is a chemical which causes permanent changes to genetic material (DNA) such that the changes will propagate through generation lines. An embryotoxin is a chemical which causes damage to a developing embryo (i.e. within the first eight weeks of pregnancy in humans), but the damage does not propagate across generational lines. A teratogen is a chemical which causes damage to a developing fetus, but the damage does not propagate across generational lines. A reproductive toxin is any substance which interferes in any way with the reproductive process.

MEDICAL CONDITIONS AGGRAVATED BY EXPOSURE: Acute or chronic respiratory conditions may be aggravated by over-exposure to the components of this product.

RECOMMENDATIONS TO PHYSICIANS: Administer oxygen, if necessary; treat symptoms; eliminate exposure.

BIOLOGICAL EXPOSURE INDICES (BEIs): Currently, Biological Exposure Indices (BEIs) are not applicable for the components of this gas mixture.

12. ECOLOGICAL INFORMATION

ENVIRONMENTAL STABILITY: The components of this gas mixture occur naturally in the atmosphere. The gas will be dissipated rapidly in well-ventilated areas. The following environmental data are applicable to the components of this product.

OXYGEN: Water Solubility = 1 volume Oxygen/32 volumes water at 20°C. Log K_{ow} = -0.65

NITROGEN: Water Solubility = 2.4 volumes Nitrogen/100 volumes water at 0°C. 1.6 volumes Nitrogen/100 volumes water at 20°C.

EFFECT OF MATERIAL ON PLANTS or ANIMALS: No evidence is currently available on this product's effects on plant and animal life.

EFFECT OF CHEMICAL ON AQUATIC LIFE: No evidence is currently available on this product's effects on aquatic life.

13. DISPOSAL CONSIDERATIONS

PREPARING WASTES FOR DISPOSAL PREPARING WASTES FOR DISPOSAL: Waste disposal must be in accordance with appropriate Federal, State, and local regulations. Cylinders with undesired residual product may be safely vented outdoors with the proper regulator. For further information, refer to Section 16 (Other Information).

14. TRANSPORTATION INFORMATION

THIS MATERIAL IS HAZARDOUS AS DEFINED BY 49 CFR 172.101 BY THE U.S. DEPARTMENT OF TRANSPORTATION.

PROPER SHIPPING NAME: Compressed gases, n.o.s. (Nitrogen, Oxygen)

HAZARD CLASS NUMBER and DESCRIPTION: 2.2 (Non-Flammable Gas)

UN IDENTIFICATION NUMBER: UN 1956

PACKING GROUP: Not applicable.

DOT LABEL(S) REQUIRED: Non-Flammable Gas

NORTH AMERICAN EMERGENCY RESPONSE GUIDEBOOK NUMBER (1996): 126

MARINE POLLUTANT: The components of this gas mixture are not classified by the DOT as Marine Pollutants (as defined by 49 CFR 172.101, Appendix B).

14. TRANSPORTATION INFORMATION (Continued)

SPECIAL SHIPPING INFORMATION: Cylinders should be transported in a secure position, in a well-ventilated vehicle. The transportation of compressed gas cylinders in automobiles or in closed-body vehicles can present serious safety hazards. If transporting these cylinders in vehicles, ensure these cylinders are not exposed to extremely high temperatures (as may occur in an enclosed vehicle on a hot day). Additionally, the vehicle should be well-ventilated during transportation.

Note: DOT 39 Cylinders ship in a strong outer carton (overpack). Pertinent shipping information goes on the outside of the overpack. DOT 39 Cylinders do not have transportation information on the cylinder itself.

TRANSPORT CANADA TRANSPORTATION OF DANGEROUS GOODS REGULATIONS: THIS MATERIAL IS CONSIDERED AS DANGEROUS GOODS. Use the above information for the preparation of Canadian Shipments.

15. REGULATORY INFORMATION

SARA REPORTING REQUIREMENTS: This product is subject to the reporting requirements of Sections 302, 304, and 313 of Title III of the Superfund Amendments and Reauthorization Act, as follows:

COMPONENT	SARA 302	SARA 304	SARA 313
Oxygen	NO	NO	NO
Nitrogen	NO	NO	NO
Isobutylene	NO	NO	NO

SARA THRESHOLD PLANNING QUANTITY: Not applicable.

TSCA INVENTORY STATUS: The components of this gas mixture are listed on the TSCA Inventory.

CERCLA REPORTABLE QUANTITY (RQ): Not applicable.

OTHER U.S. FEDERAL REGULATIONS:

- No component of this product is subject to the requirements of CFR 29 1910.1000 (under the 1989 PELs).
- Isobutylene is subject to the reporting requirements of Section 112(r) of the Clean Air Act. The Threshold Quantity for this gas is 10,000 pounds.
- The regulations of the Process Safety Management of Highly Hazardous Chemicals are not applicable (29 CFR 1910.119).
- This gas mixture does not contain any Class I or Class II ozone depleting chemicals (40 CFR Part 82).
- Nitrogen and Oxygen are not listed as Regulated Substances, per 40 CFR, Part 68, of the Risk Management for Chemical Releases. Isobutylene is listed under this regulation in Table 3 as Regulated Substances (Flammable Substances), in quantities of 10,000 lbs (4,553 kg) or greater.

OTHER CANADIAN REGULATIONS: This gas mixture is categorized as a Controlled Product, Hazard Class A, as per the Controlled Product Regulations.

STATE REGULATORY INFORMATION: The components of this gas mixture are covered under the following specific State regulations:

Alaska - Designated Toxic and Hazardous Substances: No.

California - Permissible Exposure Limits for Chemical Contaminants: Nitrogen.

Florida - Substance List: Oxygen, Isobutylene.

Illinois - Toxic Substance List: No.

Kansas - Section 302/313 List: No.

Massachusetts - Substance List: Oxygen, Isobutylene.

Michigan - Critical Materials Register: No.

Minnesota - List of Hazardous Substances: No.

Missouri - Employer Information/Toxic Substance List: No.

New Jersey - Right to Know Hazardous Substance List: Oxygen, Nitrogen, Isobutylene.

North Dakota - List of Hazardous Chemicals, Reportable Quantities: No.

Pennsylvania - Hazardous Substance List: Oxygen, Nitrogen, Isobutylene.

Rhode Island - Hazardous Substance List: Oxygen, Nitrogen.

Texas - Hazardous Substance List: No.

West Virginia - Hazardous Substance List: No.

Wisconsin - Toxic and Hazardous Substances: : No.

CALIFORNIA PROPOSITION 65: No component of this product is on the California Proposition 65 lists.

16. OTHER INFORMATION

INFORMATION ABOUT DOT-39 NRC (Non-Refillable Cylinder) PRODUCTS

DOT 39 cylinders ship as hazardous materials when full. Once the cylinders are relieved of pressure (empty) they are not considered hazardous material or waste. Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Hydrogen chloride	7647-01-0	20-38
Water	7732-18-5	62-80

Toxicological Data on Ingredients: Hydrogen chloride: GAS (LC50): Acute: 4701 ppm 0.5 hours [Rat].

Section 3: Hazards Identification

Potential Acute Health Effects:

Very hazardous in case of skin contact (corrosive, irritant, permeator), of eye contact (irritant, corrosive), of ingestion, . Slightly hazardous in case of inhalation (lung sensitizer). Non-corrosive for lungs. Liquid or spray mist may produce tissue damage particularly on mucous membranes of eyes, mouth and respiratory tract. Skin contact may produce burns. Inhalation of the spray mist may produce severe irritation of respiratory tract, characterized by coughing, choking, or shortness of breath. Severe over-exposure can result in death. Inflammation of the eye is characterized by redness, watering, and itching. Skin inflammation is characterized by itching, scaling, reddening, or, occasionally, blistering.

Potential Chronic Health Effects:

Slightly hazardous in case of skin contact (sensitizer).

CARCINOGENIC EFFECTS: Classified 3 (Not classifiable for human.) by IARC [Hydrochloric acid].

MUTAGENIC EFFECTS: Not available.

TERATOGENIC EFFECTS: Not available.

DEVELOPMENTAL TOXICITY: Not available.

The substance may be toxic to kidneys, liver, mucous membranes, upper respiratory tract, skin, eyes, Circulatory System, teeth.

Repeated or prolonged exposure to the substance can produce target organs damage. Repeated or prolonged contact with spray mist may produce chronic eye irritation and severe skin irritation. Repeated or prolonged exposure to spray mist may produce respiratory tract irritation leading to frequent attacks of bronchial infection. Repeated exposure to a highly toxic material may produce general deterioration of health by an accumulation in one or many human organs.

Section 4: First Aid Measures

Eye Contact:

Check for and remove any contact lenses. In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Cold water may be used. Get medical attention immediately.

Skin Contact:

In case of contact, immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes. Cover the irritated skin with an emollient. Cold water may be used. Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention immediately.

Serious Skin Contact:

Wash with a disinfectant soap and cover the contaminated skin with an anti-bacterial cream. Seek immediate medical attention.

Inhalation:

If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention immediately.

Serious Inhalation:

Evacuate the victim to a safe area as soon as possible. Loosen tight clothing such as a collar, tie, belt or waistband. If breathing is difficult, administer oxygen. If the victim is not breathing, perform mouth-to-mouth resuscitation. WARNING: It may be hazardous to the person providing aid to give mouth-to-mouth resuscitation when the inhaled material is toxic, infectious or corrosive. Seek immediate medical attention.

Ingestion:

If swallowed, do not induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. Loosen tight clothing such as a collar, tie, belt or waistband. Get medical attention immediately.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: Non-flammable.

Auto-Ignition Temperature: Not applicable.

Flash Points: Not applicable.

Flammable Limits: Not applicable.

Products of Combustion: Not available.

Fire Hazards in Presence of Various Substances: of metals

Explosion Hazards in Presence of Various Substances: Non-explosive in presence of open flames and sparks, of shocks.

Fire Fighting Media and Instructions: Not applicable.

Special Remarks on Fire Hazards:

Non combustible.

Calcium carbide reacts with hydrogen chloride gas with incandescence.

Uranium phosphide reacts with hydrochloric acid to release spontaneously flammable phosphine.

Rubidium acetylene carbides burns with slightly warm hydrochloric acid.

Lithium silicide in contact with hydrogen chloride becomes incandescent. When dilute hydrochloric acid is used, gas spontaneously flammable in air is evolved.

Magnesium boride treated with concentrated hydrochloric acid produces spontaneously flammable gas.

Cesium acetylene carbide burns hydrogen chloride gas.

Cesium carbide ignites in contact with hydrochloric acid unless acid is dilute.

Reacts with most metals to produce flammable Hydrogen gas.

Special Remarks on Explosion Hazards:

Hydrogen chloride in contact with the following can cause an explosion, ignition on contact, or other

violent/vigorous reaction: Acetic anhydride $\text{AgClO} + \text{CCl}_4$ Alcohols + hydrogen cyanide, Aluminum

Aluminum-titanium alloys (with HCl vapor), 2-Amino ethanol, Ammonium hydroxide, Calcium carbide Ca_3P_2

Chlorine + dinitroanilines (evolves gas), Chlorosulfonic acid Cesium carbide Cesium acetylene carbide,

1,1-Difluoroethylene Ethylene diamine Ethylene imine, Fluorine, HClO_4 Hexalithium disilicide H_2SO_4 Metal

acetylides or carbides, Magnesium boride, Mercuric sulfate, Oleum, Potassium permanganate,

beta-Propiolactone Propylene oxide Rubidium carbide, Rubidium, acetylene carbide Sodium (with aqueous HCl),

Sodium hydroxide Sodium tetraselenium, Sulfonic acid, Tetraselenium tetranitride, U_3P_4 , Vinyl acetate.

Silver perchlorate with carbon tetrachloride in the presence of hydrochloric acid produces trichloromethyl

perchlorate which detonates at 40 deg. C.

Section 6: Accidental Release Measures**Small Spill:**

Dilute with water and mop up, or absorb with an inert dry material and place in an appropriate waste disposal container. If necessary: Neutralize the residue with a dilute solution of sodium carbonate.

Large Spill:

Corrosive liquid. Poisonous liquid.

Stop leak if without risk. Absorb with DRY earth, sand or other non-combustible material. Do not get water inside container. Do not touch spilled material. Use water spray curtain to divert vapor drift. Use water spray to reduce vapors. Prevent entry into sewers, basements or confined areas; dike if needed. Call for assistance on disposal.

Neutralize the residue with a dilute solution of sodium carbonate. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage**Precautions:**

Keep locked up.. Keep container dry. Do not ingest. Do not breathe gas/fumes/ vapor/spray. Never add water to this product. In case of insufficient ventilation, wear suitable respiratory equipment. If ingested, seek medical advice immediately and show the container or the label. Avoid contact with skin and eyes. Keep away from incompatibles such as oxidizing agents, organic materials, metals, alkalis, moisture.

May corrode metallic surfaces. Store in a metallic or coated fiberboard drum using a strong polyethylene inner package.

Storage: Keep container tightly closed. Keep container in a cool, well-ventilated area.

Section 8: Exposure Controls/Personal Protection**Engineering Controls:**

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapors below their respective threshold limit value. Ensure that eyewash stations and safety showers are proximal to the work-station location.

Personal Protection:

Face shield. Full suit. Vapor respirator. Be sure to use an approved/certified respirator or equivalent. Gloves. Boots.

Personal Protection in Case of a Large Spill:

Splash goggles. Full suit. Vapor respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits:

CEIL: 5 (ppm) from OSHA (PEL) [United States]

CEIL: 7 (mg/m3) from OSHA (PEL) [United States]

CEIL: 5 from NIOSH

CEIL: 7 (mg/m3) from NIOSH

TWA: 1 STEL: 5 (ppm) [United Kingdom (UK)]

TWA: 2 STEL: 8 (mg/m3) [United Kingdom (UK)] Consult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Liquid.

Odor: Pungent. Irritating (Strong.)

Taste: Not available.

Molecular Weight: Not applicable.

Color: Colorless to light yellow.

pH (1% soln/water): Acidic.

Boiling Point:

108.58 C @ 760 mm Hg (for 20.22% HCl in water)

83 C @ 760 mm Hg (for 31% HCl in water)

50.5 C (for 37% HCl in water)

Melting Point:

-62.25°C (-80°F) (20.69% HCl in water)

-46.2 C (31.24% HCl in water)

-25.4 C (39.17% HCl in water)

Critical Temperature: Not available.

Specific Gravity:

1.1- 1.19 (Water = 1)

1.10 (20% and 22% HCl solutions)

1.12 (24% HCl solution)

1.15 (29.57% HCl solution)

1.16 (32% HCl solution)

1.19 (37% and 38% HCl solutions)

Vapor Pressure: 16 kPa (@ 20°C) average

Vapor Density: 1.267 (Air = 1)

Volatility: Not available.

Odor Threshold: 0.25 to 10 ppm

Water/Oil Dist. Coeff.: Not available.

Ionicity (in Water): Not available.

Dispersion Properties: See solubility in water, diethyl ether.

Solubility: Soluble in cold water, hot water, diethyl ether.

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Incompatible materials, water

Incompatibility with various substances:

Highly reactive with metals.

Reactive with oxidizing agents, organic materials, alkalis, water.

Corrosivity:

Extremely corrosive in presence of aluminum, of copper, of stainless steel(304), of stainless steel(316).

Non-corrosive in presence of glass.

Special Remarks on Reactivity:

Reacts with water especially when water is added to the product.

Absorption of gaseous hydrogen chloride on mercuric sulfate becomes violent @ 125 deg. C.

Sodium reacts very violently with gaseous hydrogen chloride.

Calcium phosphide and hydrochloric acid undergo very energetic reaction.

It reacts with oxidizers releasing chlorine gas.

Incompatible with, alkali metals, carbides, borides, metal oxides, vinyl acetate, acetylides, sulphides, phosphides, cyanides, carbonates.

Reacts with most metals to produce flammable Hydrogen gas.

Reacts violently (moderate reaction with heat of evolution) with water especially when water is added to the product. Isolate hydrogen chloride from heat, direct sunlight, alkalies (reacts vigorously), organic materials, and oxidizers (especially nitric acid and chlorates), amines, metals, copper and alloys (e.g. brass), hydroxides, zinc (galvanized materials), lithium silicide (incandescence), sulfuric acid(increase in temperature and pressure)

Hydrogen chloride gas is emitted when this product is in contact with sulfuric acid.

Adsorption of Hydrochloric Acid onto silicon dioxide results in exothermic reaction.

Hydrogen chloride causes aldehydes and epoxides to violently polymerize.

Hydrogen chloride or Hydrochloric Acid in contact with the following can cause explosion or ignition on contact or

Special Remarks on Corrosivity:

Highly corrosive. Incompatible with copper and copper alloys. It attacks nearly all metals (mercury, gold, platinum, tantalum, silver, and certain alloys are exceptions).

It is one of the most corrosive of the nonoxidizing acids in contact with copper alloys.

No corrosivity data on zinc, steel.

Severe Corrosive effect on brass and bronze

Polymerization: Will not occur.

Section 11: Toxicological Information

Routes of Entry: Absorbed through skin. Dermal contact. Eye contact. Inhalation.

Toxicity to Animals:

Acute oral toxicity (LD50): 900 mg/kg [Rabbit].

Acute toxicity of the vapor (LC50): 1108 ppm, 1 hours [Mouse].

Acute toxicity of the vapor (LC50): 3124 ppm, 1 hours [Rat].

Chronic Effects on Humans:

CARCINOGENIC EFFECTS: Classified 3 (Not classifiable for human.) by IARC [Hydrochloric acid].

May cause damage to the following organs: kidneys, liver, mucous membranes, upper respiratory tract, skin,

eyes, Circulatory System, teeth.

Other Toxic Effects on Humans:

Very hazardous in case of skin contact (corrosive, irritant, permeator), of ingestion, .
Hazardous in case of eye contact (corrosive), of inhalation (lung corrosive).

Special Remarks on Toxicity to Animals:

Lowest Published Lethal Doses (LDL/LCL)

LDL [Man] -Route: Oral; 2857 ug/kg

LCL [Human] - Route: Inhalation; Dose: 1300 ppm/30M

LCL [Rabbit] - Route: Inhalation; Dose: 4413 ppm/30M

Special Remarks on Chronic Effects on Humans:

May cause adverse reproductive effects (fetotoxicity).

May affect genetic material.

Special Remarks on other Toxic Effects on Humans:

Acute Potential Health Effects:

Skin: Corrosive. Causes severe skin irritation and burns.

Eyes: Corrosive. Causes severe eye irritation/conjunctivitis, burns, corneal necrosis.

Inhalation: May be fatal if inhaled. Material is extremely destructive to tissue of the mucous membranes and upper respiratory tract. Inhalation of hydrochloric acid fumes produces nose, throat, and laryngeal burning, and irritation, pain and inflammation, coughing, sneezing, choking sensation, hoarseness, laryngeal spasms, upper respiratory tract edema, chest pains, as well as headache, and palpitations. Inhalation of high concentrations can result in corrosive burns, necrosis of bronchial epithelium, constriction of the larynx and bronchi, nasospetal perforation, glottal closure, occur, particularly if exposure is prolonged. May affect the liver.

Ingestion: May be fatal if swallowed. Causes irritation and burning, ulceration, or perforation of the gastrointestinal tract and resultant peritonitis, gastric hemorrhage and infection. Can also cause nausea, vomiting (with "coffee ground" emesis), diarrhea, thirst, difficulty swallowing, salivation, chills, fever, uneasiness, shock, strictures and stenosis (esophageal, gastric, pyloric). May affect behavior (excitement), the cardiovascular system (weak rapid pulse, tachycardia), respiration (shallow respiration), and urinary system (kidneys- renal failure, nephritis).

Acute exposure via inhalation or ingestion can also cause erosion of tooth enamel.

Chronic Potential Health Effects:

dyspnea, bronchitis. Chemical pneumonitis and pulmonary edema can also

Section 12: Ecological Information

Ecotoxicity: Not available.

BOD5 and COD: Not available.

Products of Biodegradation:

Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The products of degradation are less toxic than the product itself.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:

Waste must be disposed of in accordance with federal, state and local environmental control regulations.

Section 14: Transport Information

DOT Classification: Class 8: Corrosive material

Identification: : Hydrochloric acid, solution UNNA: 1789 PG: II

Special Provisions for Transport: Not available.

Section 15: Other Regulatory Information

Federal and State Regulations:

Connecticut hazardous material survey.: Hydrochloric acid
Illinois toxic substances disclosure to employee act: Hydrochloric acid
Illinois chemical safety act: Hydrochloric acid
New York release reporting list: Hydrochloric acid
Rhode Island RTK hazardous substances: Hydrochloric acid
Pennsylvania RTK: Hydrochloric acid
Minnesota: Hydrochloric acid
Massachusetts RTK: Hydrochloric acid
Massachusetts spill list: Hydrochloric acid
New Jersey: Hydrochloric acid
New Jersey spill list: Hydrochloric acid
Louisiana RTK reporting list: Hydrochloric acid
Louisiana spill reporting: Hydrochloric acid
California Director's List of Hazardous Substances: Hydrochloric acid
TSCA 8(b) inventory: Hydrochloric acid
TSCA 4(a) proposed test rules: Hydrochloric acid
SARA 302/304/311/312 extremely hazardous substances: Hydrochloric acid
SARA 313 toxic chemical notification and release reporting: Hydrochloric acid
CERCLA: Hazardous substances.: Hydrochloric acid: 5000 lbs. (2268 kg)

Other Regulations:

OSHA: Hazardous by definition of Hazard Communication Standard (29 CFR 1910.1200).
EINECS: This product is on the European Inventory of Existing Commercial Chemical Substances.

Other Classifications:

WHMIS (Canada):

CLASS D-2A: Material causing other toxic effects (VERY TOXIC).
CLASS E: Corrosive liquid.

DSCL (EEC):

R34- Causes burns.
R37- Irritating to respiratory system.
S26- In case of contact with eyes, rinse immediately with plenty of water and seek medical advice.
S45- In case of accident or if you feel unwell, seek medical advice immediately (show the label where possible).

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Water	7732-18-5	93
Nitric acid, fuming	7697-37-2	7

Toxicological Data on Ingredients: Nitric acid, fuming: VAPOR (LC50): Acute: 67 ppm 4 hour(s) [Rat].

Section 3: Hazards Identification

Potential Acute Health Effects:

Very hazardous in case of skin contact (corrosive, irritant, permeator), of eye contact (irritant), of ingestion, of inhalation. Liquid or spray mist may produce tissue damage particularly on mucous membranes of eyes, mouth and respiratory tract. Skin contact may produce burns. Inhalation of the spray mist may produce severe irritation of respiratory tract, characterized by coughing, choking, or shortness of breath. Severe over-exposure can result in death. Inflammation of the eye is characterized by redness, watering, and itching. Skin inflammation is characterized by itching, scaling, reddening, or, occasionally, blistering.

Potential Chronic Health Effects:

Very hazardous in case of skin contact (corrosive, irritant, permeator), of eye contact (irritant), of ingestion, of inhalation.

Non-sensitizer for skin.

CARCINOGENIC EFFECTS: Not available.

MUTAGENIC EFFECTS: Not available.

TERATOGENIC EFFECTS: Not available.

DEVELOPMENTAL TOXICITY: Not available.

The substance is toxic to lungs, mucous membranes.

Repeated or prolonged exposure to the substance can produce target organs damage. Repeated or prolonged contact with spray mist may produce chronic eye irritation and severe skin irritation. Repeated or prolonged exposure to spray mist may produce respiratory tract irritation leading to frequent attacks of bronchial infection. Repeated exposure to an highly toxic material may produce general deterioration of health by an accumulation in one or many human organs. Repeated or prolonged inhalation of vapors may lead to chronic respiratory irritation.

Section 4: First Aid Measures

Eye Contact:

Check for and remove any contact lenses. Immediately flush eyes with running water for at least 15 minutes, keeping eyelids open. Cold water may be used. Do not use an eye ointment. Seek medical attention.

Skin Contact:

If the chemical got onto the clothed portion of the body, remove the contaminated clothes as quickly as possible, protecting your own hands and body. Place the victim under a deluge shower. If the chemical got on the victim's exposed skin, such as the hands : Gently and thoroughly wash the contaminated skin with running water and non-abrasive soap. Be particularly careful to clean folds, crevices, creases and groin. Cold water may be used. If irritation persists, seek medical attention. Wash contaminated clothing before reusing.

Serious Skin Contact:

Wash with a disinfectant soap and cover the contaminated skin with an anti-bacterial cream. Seek immediate medical attention.

Inhalation: Allow the victim to rest in a well ventilated area. Seek immediate medical attention.

Serious Inhalation:

Evacuate the victim to a safe area as soon as possible. Loosen tight clothing such as a collar, tie, belt or waistband. If breathing is difficult, administer oxygen. If the victim is not breathing, perform mouth-to-mouth resuscitation. WARNING: It may be hazardous to the person providing aid to give mouth-to-mouth resuscitation when the inhaled material is toxic, infectious or corrosive. Seek immediate medical attention.

Ingestion:

Do not induce vomiting. Examine the lips and mouth to ascertain whether the tissues are damaged, a possible indication that the toxic material was ingested; the absence of such signs, however, is not conclusive. Loosen tight clothing such as a collar, tie, belt or waistband. If the victim is not breathing, perform mouth-to-mouth resuscitation. Seek immediate medical attention.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: Non-flammable.

Auto-Ignition Temperature: Not applicable.

Flash Points: Not applicable.

Flammable Limits: Not applicable.

Products of Combustion: Not available.

Fire Hazards in Presence of Various Substances: Not applicable.

Explosion Hazards in Presence of Various Substances:

Risks of explosion of the product in presence of mechanical impact: Not available.

Risks of explosion of the product in presence of static discharge: Not available.
Slightly explosive to explosive in presence of reducing materials, of combustible materials, of organic materials.

Fire Fighting Media and Instructions: Not applicable.

Special Remarks on Fire Hazards: Not available.

Special Remarks on Explosion Hazards: Not available.

Section 6: Accidental Release Measures

Small Spill:

Dilute with water and mop up, or absorb with an inert dry material and place in an appropriate waste disposal container. If necessary: Neutralize the residue with a dilute solution of sodium carbonate.

Large Spill:

Corrosive liquid.

Stop leak if without risk. Absorb with DRY earth, sand or other non-combustible material. Do not get water inside container. Do not touch spilled material. Use water spray curtain to divert vapor drift. Prevent entry into sewers, basements or confined areas; dike if needed. Call for assistance on disposal. Neutralize the residue with a dilute solution of sodium carbonate. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions:

Keep locked up Keep container dry. Do not ingest. Do not breathe gas/fumes/ vapour/spray. Never add water to this product In case of insufficient ventilation, wear suitable respiratory equipment If ingested, seek medical advice immediately and show the container or the label. Avoid contact with skin and eyes Keep away from incompatibles such as reducing agents, combustible materials, metals, alkalis.

May corrode metallic surfaces. Store in a metallic or coated fiberboard drum using a strong polyethylene inner package.

Storage:

May corrode metallic surfaces. Store in a metallic or coated fiberboard drum using a strong polyethylene inner package. Corrosive materials should be stored in a separate safety storage cabinet or room.

Section 8: Exposure Controls/Personal Protection

Engineering Controls:

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapors below their respective threshold limit value. Ensure that eyewash stations and safety showers are proximal to the work-station location.

Personal Protection:

Face shield. Full suit. Vapor respirator. Be sure to use an approved/certified respirator or equivalent. Gloves. Boots.

Personal Protection in Case of a Large Spill:

Splash goggles. Full suit. Vapor respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits:

Nitric acid, fuming

TWA: 2 CEIL: 4 (ppm)

TWA: 5 CEIL: 10 (mg/m3)

Consult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Liquid.

Odor: Disagreeable and choking. (Strong.)

Taste: Not available.

Molecular Weight: Not applicable.

Color: Clear Colorless.

pH (1% soln/water): Acidic.

Boiling Point: The lowest known value is 82.6°C (180.7°F) (Nitric acid, fuming). Weighted average: 98.78°C (209.8°F)

Melting Point: May start to solidify at -41.6°C (-42.9°F) based on data for: Nitric acid, fuming.

Critical Temperature: Not available.

Specific Gravity: Weighted average: 1.02 (Water = 1)

Vapor Pressure:

The highest known value is 45 mm of Hg (@ 20°C) (Nitric acid, fuming). Weighted average: 19.46 mm of Hg (@ 20°C)

Vapor Density: The highest known value is 0.62 (Air = 1) (Water).

Volatility: Not available.

Odor Threshold: The highest known value is 0.29 ppm (Nitric acid, fuming)

Water/Oil Dist. Coeff.: Not available.

Ionicity (in Water): Not available.

Dispersion Properties: See solubility in water.

Solubility: Easily soluble in cold water.

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Not available.

Incompatibility with various substances:

Extremely reactive or incompatible with alkalis.

Highly reactive with metals.

Reactive with reducing agents, combustible materials.

Slightly reactive to reactive with organic materials, acids.

Corrosivity:

Highly corrosive in presence of steel, of aluminum, of zinc, of copper.

Corrosive in presence of stainless steel(304).

Slightly corrosive to corrosive in presence of stainless steel(316).

Non-corrosive in presence of glass.

Special Remarks on Reactivity: Not available.

Special Remarks on Corrosivity: Not available.

Polymerization: No.

Section 11: Toxicological Information

Routes of Entry: Dermal contact. Eye contact. Inhalation. Ingestion.

Toxicity to Animals:

WARNING: THE LC50 VALUES HEREUNDER ARE ESTIMATED ON THE BASIS OF A 4-HOUR EXPOSURE.
Acute toxicity of the vapor (LC50): 957 ppm 4 hour(s) (Rat) (Calculated value for the mixture).

Chronic Effects on Humans: The substance is toxic to lungs, mucous membranes.

Other Toxic Effects on Humans: Very hazardous in case of skin contact (corrosive, irritant, permeator), of ingestion, of inhalation.

Special Remarks on Toxicity to Animals: Not available.

Special Remarks on Chronic Effects on Humans: Not available.

Special Remarks on other Toxic Effects on Humans: Not available.

Section 12: Ecological Information

Ecotoxicity: Not available.

BOD5 and COD: Not available.

Products of Biodegradation:

Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The products of degradation are less toxic than the product itself.

Special Remarks on the Products of Biodegradation: Not available.

MATERIAL SAFETY DATA SHEET

Diesel Fuel (All Types)

MSDS No. 9909

EMERGENCY OVERVIEW

CAUTION!

**OSHA/NFPA COMBUSTIBLE LIQUID - SLIGHT TO MODERATE IRRITANT
EFFECTS CENTRAL NERVOUS SYSTEM
HARMFUL OR FATAL IF SWALLOWED**

Moderate fire hazard. Avoid breathing vapors or mists. May cause dizziness and drowsiness. May cause moderate eye irritation and skin irritation (rash). Long-term, repeated exposure may cause skin cancer. If ingested, do NOT induce vomiting, as this may cause chemical pneumonia (fluid in the lungs).

NFPA 704 (Section 16)

1. CHEMICAL PRODUCT AND COMPANY INFORMATION

Hess Corporation
1 Hess Plaza
Woodbridge, NJ 07095-0961

EMERGENCY TELEPHONE NUMBER (24 hrs): **CHEMTREC (800) 424-9300**

COMPANY CONTACT (business hours): Corporate Safety (732) 750-6000

MSDS INTERNET WEBSITE: www.hess.com (See Environment, Health, Safety & Social Responsibility)

SYNONYMS: Ultra Low Sulfur Diesel (ULSD); Low Sulfur Diesel; Motor Vehicle Diesel Fuel; Diesel Fuel #2; Dyed Diesel Fuel; Non-Road, Locomotive and Marine Diesel Fuel; Tax-exempt Diesel Fuel

See Section 16 for abbreviations and acronyms.

2. COMPOSITION and CHEMICAL INFORMATION ON INGREDIENTS

INGREDIENT NAME (CAS No.)	CONCENTRATION PERCENT BY WEIGHT
Diesel Fuel (68476-34-6)	100
Naphthalene (91-20-3)	Typically < 0.01

A complex mixture of hydrocarbons with carbon numbers in the range C9 and higher. Diesel fuel may be dyed (red) for tax purposes. May contain a multifunctional additive.

3. HAZARDS IDENTIFICATION

EYES

Contact with liquid or vapor may cause mild irritation.

SKIN

May cause skin irritation with prolonged or repeated contact. Practically non-toxic if absorbed following acute (single) exposure. Liquid may be absorbed through the skin in toxic amounts if large areas of skin are repeatedly exposed.

INGESTION

The major health threat of ingestion occurs from the danger of aspiration (breathing) of liquid drops into the lungs, particularly from vomiting. Aspiration may result in chemical pneumonia (fluid in the lungs), severe lung damage, respiratory failure and even death.

Ingestion may cause gastrointestinal disturbances, including irritation, nausea, vomiting and diarrhea, and central nervous system (brain) effects similar to alcohol intoxication. In severe cases, tremors, convulsions, loss of consciousness, coma, respiratory arrest, and death may occur.

MATERIAL SAFETY DATA SHEET

Diesel Fuel (All Types)

MSDS No. 9909

INHALATION

Excessive exposure may cause irritations to the nose, throat, lungs and respiratory tract. Central nervous system (brain) effects may include headache, dizziness, loss of balance and coordination, unconsciousness, coma, respiratory failure, and death.

WARNING: the burning of any hydrocarbon as a fuel in an area without adequate ventilation may result in hazardous levels of combustion products, including carbon monoxide, and inadequate oxygen levels, which may cause unconsciousness, suffocation, and death.

CHRONIC EFFECTS and CARCINOGENICITY

Similar products produced skin cancer and systemic toxicity in laboratory animals following repeated applications. The significance of these results to human exposures has not been determined - see Section 11 Toxicological Information.

IARC classifies whole diesel fuel exhaust particulates as probably carcinogenic to humans (Group 2A). NIOSH regards whole diesel fuel exhaust particulates as a potential cause of occupational lung cancer based on animal studies and limited evidence in humans.

MEDICAL CONDITIONS AGGRAVATED BY EXPOSURE

Irritation from skin exposure may aggravate existing open wounds, skin disorders, and dermatitis (rash).

4. FIRST AID MEASURES

EYES

In case of contact with eyes, immediately flush with clean, low-pressure water for at least 15 min. Hold eyelids open to ensure adequate flushing. Seek medical attention.

SKIN

Remove contaminated clothing. Wash contaminated areas thoroughly with soap and water or waterless hand cleanser. Obtain medical attention if irritation or redness develops.

INGESTION

DO NOT INDUCE VOMITING. Do not give liquids. Obtain immediate medical attention. If spontaneous vomiting occurs, lean victim forward to reduce the risk of aspiration. Monitor for breathing difficulties. Small amounts of material which enter the mouth should be rinsed out until the taste is dissipated.

INHALATION

Remove person to fresh air. If person is not breathing provide artificial respiration. If necessary, provide additional oxygen once breathing is restored if trained to do so. Seek medical attention immediately.

5. FIRE FIGHTING MEASURES

FLAMMABLE PROPERTIES:

FLASH POINT:	>	125 °F (> 52 °C) minimum PMCC
AUTOIGNITION POINT:		494 °F (257 °C)
OSHA/NFPA FLAMMABILITY CLASS:		2 (COMBUSTIBLE)
LOWER EXPLOSIVE LIMIT (%):		0.6
UPPER EXPLOSIVE LIMIT (%):		7.5

FIRE AND EXPLOSION HAZARDS

Vapors may be ignited rapidly when exposed to heat, spark, open flame or other source of ignition. When mixed with air and exposed to an ignition source, flammable vapors can burn in the open or explode in confined spaces. Being heavier than air, vapors may travel long distances to an ignition source and flash back. Runoff to sewer may cause fire or explosion hazard.

EXTINGUISHING MEDIA

SMALL FIRES: Any extinguisher suitable for Class B fires, dry chemical, CO₂, water spray, fire fighting foam, or Halon.

MATERIAL SAFETY DATA SHEET

Diesel Fuel (All Types)

MSDS No. 9909

LARGE FIRES: Water spray, fog or fire fighting foam. Water may be ineffective for fighting the fire, but may be used to cool fire-exposed containers.

FIRE FIGHTING INSTRUCTIONS

Small fires in the incipient (beginning) stage may typically be extinguished using handheld portable fire extinguishers and other fire fighting equipment.

Firefighting activities that may result in potential exposure to high heat, smoke or toxic by-products of combustion should require NIOSH/MSHA- approved pressure-demand self-contained breathing apparatus with full facepiece and full protective clothing.

Isolate area around container involved in fire. Cool tanks, shells, and containers exposed to fire and excessive heat with water. For massive fires the use of unmanned hose holders or monitor nozzles may be advantageous to further minimize personnel exposure. Major fires may require withdrawal, allowing the tank to burn. Large storage tank fires typically require specially trained personnel and equipment to extinguish the fire, often including the need for properly applied fire fighting foam.

See Section 16 for the NFPA 704 Hazard Rating.

6. ACCIDENTAL RELEASE MEASURES

ACTIVATE FACILITY'S SPILL CONTINGENCY OR EMERGENCY RESPONSE PLAN.

Evacuate nonessential personnel and remove or secure all ignition sources. Consider wind direction; stay upwind and uphill, if possible. Evaluate the direction of product travel, diking, sewers, etc. to confirm spill areas. Spills may infiltrate subsurface soil and groundwater; professional assistance may be necessary to determine the extent of subsurface impact.

Carefully contain and stop the source of the spill, if safe to do so. Protect bodies of water by diking, absorbents, or absorbent boom, if possible. Do not flush down sewer or drainage systems, unless system is designed and permitted to handle such material. The use of fire fighting foam may be useful in certain situations to reduce vapors. The proper use of water spray may effectively disperse product vapors or the liquid itself, preventing contact with ignition sources or areas/equipment that require protection.

Take up with sand or other oil absorbing materials. Carefully shovel, scoop or sweep up into a waste container for reclamation or disposal - caution, flammable vapors may accumulate in closed containers. Response and clean-up crews must be properly trained and must utilize proper protective equipment (see Section 8).

7. HANDLING and STORAGE

HANDLING PRECAUTIONS

Handle as a combustible liquid. Keep away from heat, sparks, and open flame! Electrical equipment should be approved for classified area. Bond and ground containers during product transfer to reduce the possibility of static-initiated fire or explosion.

Diesel fuel, and in particular low and ultra low sulfur diesel fuel, has the capability of accumulating a static electrical charge of sufficient energy to cause a fire/explosion in the presence of lower flashpoint products such as gasoline. The accumulation of such a static charge occurs as the diesel flows through pipelines, filters, nozzles and various work tasks such as tank/container filling, splash loading, tank cleaning; product sampling; tank gauging; cleaning, mixing, vacuum truck operations, switch loading, and product agitation. There is a greater potential for static charge accumulation in cold temperature, low humidity conditions.

Documents such as 29 CFR OSHA 1910.106 "Flammable and Combustible Liquids, NFPA 77 Recommended Practice on Static Electricity, API 2003 "Protection Against Ignitions Arising Out of Static, Lightning, and Stray Currents and ASTM D4865 "Standard Guide for Generation and Dissipation of Static

MATERIAL SAFETY DATA SHEET

Diesel Fuel (All Types)

MSDS No. 9909

Electricity in Petroleum Fuel Systems" address special precautions and design requirements involving loading rates, grounding, bonding, filter installation, conductivity additives and especially the hazards associated with "switch loading." ["Switch Loading" is when a higher flash point product (such as diesel) is loaded into tanks previously containing a low flash point product (such as gasoline) and the electrical charge generated during loading of the diesel results in a static ignition of the vapor from the previous cargo (gasoline).]

Note: When conductivity additives are used or are necessary the product should achieve 25 picosiemens/meter or greater at the handling temperature.

STORAGE PRECAUTIONS

Keep away from flame, sparks, excessive temperatures and open flame. Use approved vented containers. Keep containers closed and clearly labeled. Empty product containers or vessels may contain explosive vapors. Do not pressurize, cut, heat, weld or expose such containers to sources of ignition.

Store in a well-ventilated area. This storage area should comply with NFPA 30 "Flammable and Combustible Liquid Code". Avoid storage near incompatible materials. The cleaning of tanks previously containing this product should follow API Recommended Practice (RP) 2013 "Cleaning Mobile Tanks In Flammable and Combustible Liquid Service" and API RP 2015 "Cleaning Petroleum Storage Tanks".

WORK/HYGIENIC PRACTICES

Emergency eye wash capability should be available in the near proximity to operations presenting a potential splash exposure. Use good personal hygiene practices. Avoid repeated and/or prolonged skin exposure. Wash hands before eating, drinking, smoking, or using toilet facilities. Do not use as a cleaning solvent on the skin. Do not use solvents or harsh abrasive skin cleaners for washing this product from exposed skin areas. Waterless hand cleaners are effective. Promptly remove contaminated clothing and launder before reuse. Use care when laundering to prevent the formation of flammable vapors which could ignite via washer or dryer. Consider the need to discard contaminated leather shoes and gloves.

8. EXPOSURE CONTROLS and PERSONAL PROTECTION

EXPOSURE LIMITS

Components (CAS No.)	Source	<u>Exposure Limits</u>		Note
		TWA/STEL		
Diesel Fuel: (68476-34-6)	OSHA	5 mg/m, as mineral oil mist		
	ACGIH	100 mg/m ³ (as totally hydrocarbon vapor) TWA		A3, skin
Naphthalene (91-20-3)	OSHA	10 ppm TWA		
	ACGIH	10 ppm TWA / 15 ppm STEL		A4, Skin

ENGINEERING CONTROLS

Use adequate ventilation to keep vapor concentrations of this product below occupational exposure and flammability limits, particularly in confined spaces.

EYE/FACE PROTECTION

Safety glasses or goggles are recommended where there is a possibility of splashing or spraying.

SKIN PROTECTION

Gloves constructed of nitrile, neoprene, or PVC are recommended. Chemical protective clothing such as of E.I. DuPont TyChem®, Saranex® or equivalent recommended based on degree of exposure. Note: The resistance of specific material may vary from product to product as well as with degree of exposure. Consult manufacturer specifications for further information.

MATERIAL SAFETY DATA SHEET

Diesel Fuel (All Types)

MSDS No. 9909

RESPIRATORY PROTECTION

A NIOSH/MSHA-approved air-purifying respirator with organic vapor cartridges or canister may be permissible under certain circumstances where airborne concentrations are or may be expected to exceed exposure limits or for odor or irritation. Protection provided by air-purifying respirators is limited. Refer to OSHA 29 CFR 1910.134, NIOSH Respirator Decision Logic, and the manufacturer for additional guidance on respiratory protection selection.

Use a positive pressure, air-supplied respirator if there is a potential for uncontrolled release, exposure levels are not known, in oxygen-deficient atmospheres, or any other circumstance where an air-purifying respirator may not provide adequate protection.

9. PHYSICAL and CHEMICAL PROPERTIES

APPEARANCE

Clear, straw-yellow liquid. Dyed fuel oil will be red or reddish-colored.

ODOR

Mild, petroleum distillate odor

BASIC PHYSICAL PROPERTIES

BOILING RANGE: 320 to 690 oF (160 to 366 °C)
VAPOR PRESSURE: 0.009 psia @ 70 °F (21 °C)
VAPOR DENSITY (air = 1): > 1.0
SPECIFIC GRAVITY (H₂O = 1): 0.83 to 0.88 @ 60 °F (16 °C)
PERCENT VOLATILES: 100 %
EVAPORATION RATE: Slow; varies with conditions
SOLUBILITY (H₂O): Negligible

10. STABILITY and REACTIVITY

STABILITY: Stable. Hazardous polymerization will not occur.

CONDITIONS TO AVOID and INCOMPATIBLE MATERIALS

Avoid high temperatures, open flames, sparks, welding, smoking and other ignition sources. Keep away from strong oxidizers; Viton ®; Fluorel ®

HAZARDOUS DECOMPOSITION PRODUCTS

Carbon monoxide, carbon dioxide and non-combusted hydrocarbons (smoke).

11. TOXICOLOGICAL PROPERTIES

ACUTE TOXICITY

Acute dermal LD50 (rabbits): > 5 ml/kg Acute oral LD50 (rats): 9 ml/kg
Primary dermal irritation: extremely irritating (rabbits) Draize eye irritation: non-irritating (rabbits)
Guinea pig sensitization: negative

CHRONIC EFFECTS AND CARCINOGENICITY

Carcinogenic: OSHA: NO IARC: NO NTP: NO ACGIH: A3

Studies have shown that similar products produce skin tumors in laboratory animals following repeated applications without washing or removal. The significance of this finding to human exposure has not been determined. Other studies with active skin carcinogens have shown that washing the animal's skin with soap and water between applications reduced tumor formation.

MUTAGENICITY (genetic effects)

This material has been positive in a mutagenicity study.

MATERIAL SAFETY DATA SHEET

Diesel Fuel (All Types)

MSDS No. 9909

12. ECOLOGICAL INFORMATION

Keep out of sewers, drainage areas, and waterways. Report spills and releases, as applicable, under Federal and State regulations.

13. DISPOSAL CONSIDERATIONS

Consult federal, state and local waste regulations to determine appropriate disposal options.

14. TRANSPORTATION INFORMATION

PROPER SHIPPING NAME:	Diesel Fuel	Placard (International Only):
HAZARD CLASS and PACKING GROUP:	3, PG III	
DOT IDENTIFICATION NUMBER:	NA 1993 (Domestic)	
UN	1202 (International)	
DOT SHIPPING LABEL:	None	
Use shipping		Combustible Placard if in bulk domestically

15. REGULATORY INFORMATION

U.S. FEDERAL, STATE, and LOCAL REGULATORY INFORMATION

This product and its constituents listed herein are on the EPA TSCA Inventory. Any spill or uncontrolled release of this product, including any substantial threat of release, may be subject to federal, state and/or local reporting requirements. This product and/or its constituents may also be subject to other regulations at the state and/or local level. Consult those regulations applicable to your facility/operation.

CLEAN WATER ACT (OIL SPILLS)

Any spill or release of this product to "navigable waters" (essentially any surface water, including certain wetlands) or adjoining shorelines sufficient to cause a visible sheen or deposit of a sludge or emulsion must be reported immediately to the National Response Center (1-800-424-8802) as required by U.S. Federal Law. Also contact appropriate state and local regulatory agencies as required.

CERCLA SECTION 103 and SARA SECTION 304 (RELEASE TO THE ENVIRONMENT)

The CERCLA definition of hazardous substances contains a "petroleum exclusion" clause which exempts crude oil, refined, and unrefined petroleum products and any indigenous components of such. However, other federal reporting requirements (e.g., SARA Section 304 as well as the Clean Water Act if the spill occurs on navigable waters) may still apply.

SARA SECTION 311/312 - HAZARD CLASSES

<u>ACUTE HEALTH</u>	<u>CHRONIC HEALTH</u>	<u>FIRE</u>	<u>SUDDEN RELEASE OF PRESSURE</u>	<u>REACTIVE</u>
X	X	X	--	--

SARA SECTION 313 - SUPPLIER NOTIFICATION

This product may contain listed chemicals below the *de minimis* levels which therefore are not subject to the supplier notification requirements of Section 313 of the Emergency Planning and Community Right-To-Know Act (EPCRA) of 1986 and of 40 CFR 372. If you may be required to report releases of chemicals listed in 40 CFR 372.28, you may contact Hess Corporate Safety if you require additional information regarding this product.

CALIFORNIA PROPOSITION 65 LIST OF CHEMICALS

This product contains the following chemicals that are included on the Proposition 65 "List of Chemicals" required by the California Safe Drinking Water and Toxic Enforcement Act of 1986:

<u>INGREDIENT NAME (CAS NUMBER)</u>	<u>Date Listed</u>
Diesel Engine Exhaust (no CAS Number listed)	10/01/1990

CANADIAN REGULATORY INFORMATION (WHMIS)

Class B, Division 3 (Combustible Liquid) and Class D, Division 2, Subdivision B (Toxic by other means)

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Hydrogen chloride	7647-01-0	20-38
Water	7732-18-5	62-80

Toxicological Data on Ingredients: Hydrogen chloride: GAS (LC50): Acute: 4701 ppm 0.5 hours [Rat].

Section 3: Hazards Identification

Potential Acute Health Effects:

Very hazardous in case of skin contact (corrosive, irritant, permeator), of eye contact (irritant, corrosive), of ingestion, . Slightly hazardous in case of inhalation (lung sensitizer). Non-corrosive for lungs. Liquid or spray mist may produce tissue damage particularly on mucous membranes of eyes, mouth and respiratory tract. Skin contact may produce burns. Inhalation of the spray mist may produce severe irritation of respiratory tract, characterized by coughing, choking, or shortness of breath. Severe over-exposure can result in death. Inflammation of the eye is characterized by redness, watering, and itching. Skin inflammation is characterized by itching, scaling, reddening, or, occasionally, blistering.

Potential Chronic Health Effects:

Slightly hazardous in case of skin contact (sensitizer). CARCINOGENIC EFFECTS: Classified 3 (Not classifiable for human.) by IARC [Hydrochloric acid]. MUTAGENIC EFFECTS: Not available. TERATOGENIC EFFECTS: Not available. DEVELOPMENTAL TOXICITY: Not available. The substance may be toxic to kidneys, liver, mucous membranes, upper respiratory tract, skin, eyes, Circulatory System, teeth. Repeated or prolonged exposure to the substance can produce target

organs damage. Repeated or prolonged contact with spray mist may produce chronic eye irritation and severe skin irritation. Repeated or prolonged exposure to spray mist may produce respiratory tract irritation leading to frequent attacks of bronchial infection. Repeated exposure to a highly toxic material may produce general deterioration of health by an accumulation in one or many human organs.

Section 4: First Aid Measures

Eye Contact:

Check for and remove any contact lenses. In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Cold water may be used. Get medical attention immediately.

Skin Contact:

In case of contact, immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes. Cover the irritated skin with an emollient. Cold water may be used. Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention immediately.

Serious Skin Contact:

Wash with a disinfectant soap and cover the contaminated skin with an anti-bacterial cream. Seek immediate medical attention.

Inhalation:

If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention immediately.

Serious Inhalation:

Evacuate the victim to a safe area as soon as possible. Loosen tight clothing such as a collar, tie, belt or waistband. If breathing is difficult, administer oxygen. If the victim is not breathing, perform mouth-to-mouth resuscitation. **WARNING:** It may be hazardous to the person providing aid to give mouth-to-mouth resuscitation when the inhaled material is toxic, infectious or corrosive. Seek immediate medical attention.

Ingestion:

If swallowed, do not induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. Loosen tight clothing such as a collar, tie, belt or waistband. Get medical attention immediately.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: Non-flammable.

Auto-Ignition Temperature: Not applicable.

Flash Points: Not applicable.

Flammable Limits: Not applicable.

Products of Combustion: Not available.

Fire Hazards in Presence of Various Substances: of metals

Explosion Hazards in Presence of Various Substances: Non-explosive in presence of open flames and sparks, of shocks.

Fire Fighting Media and Instructions: Not applicable.

Special Remarks on Fire Hazards:

Non combustible. Calcium carbide reacts with hydrogen chloride gas with incandescence. Uranium phosphide reacts with hydrochloric acid to release spontaneously flammable phosphine. Rubidium acetylene carbides burns with slightly warm hydrochloric acid. Lithium silicide in contact with hydrogen chloride becomes incandescent. When dilute hydrochloric acid is used, gas spontaneously flammable in air is evolved. Magnesium boride treated with concentrated hydrochloric acid produces spontaneously flammable gas. Cesium acetylene carbide burns hydrogen chloride gas. Cesium carbide ignites in contact with hydrochloric acid unless acid is dilute. Reacts with most metals to produce flammable Hydrogen gas.

Special Remarks on Explosion Hazards:

Hydrogen chloride in contact with the following can cause an explosion, ignition on contact, or other violent/vigorous reaction: Acetic anhydride AgClO + CCl₄ Alcohols + hydrogen cyanide, Aluminum Aluminum-titanium alloys (with HCl vapor), 2-Amino ethanol, Ammonium hydroxide, Calcium carbide Ca₃P₂ Chlorine + dinitroanilines (evolves gas), Chlorosulfonic acid Cesium carbide Cesium acetylene carbide, 1,1-Difluoroethylene Ethylene diamine Ethylene imine, Fluorine, HClO₄ Hexalithium disilicide H₂SO₄ Metal acetylides or carbides, Magnesium boride, Mercuric sulfate, Oleum, Potassium permanganate, beta-Propiolactone Propylene oxide Rubidium carbide, Rubidium, acetylene carbide Sodium (with aqueous HCl), Sodium hydroxide Sodium tetraselenium, Sulfonic acid, Tetraselenium tetranitride, U₃P₄, Vinyl acetate. Silver perchlorate with carbon tetrachloride in the presence of hydrochloric acid produces trichloromethyl perchlorate which detonates at 40 deg. C.

Section 6: Accidental Release Measures

Small Spill:

Dilute with water and mop up, or absorb with an inert dry material and place in an appropriate waste disposal container. If necessary: Neutralize the residue with a dilute solution of sodium carbonate.

Large Spill:

Corrosive liquid. Poisonous liquid. Stop leak if without risk. Absorb with DRY earth, sand or other non-combustible material. Do not get water inside container. Do not touch spilled material. Use water spray curtain to divert vapor drift. Use water spray to reduce vapors. Prevent entry into sewers, basements or confined areas; dike if needed. Call for assistance on disposal. Neutralize the residue with a dilute solution of sodium carbonate. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions:

Keep locked up.. Keep container dry. Do not ingest. Do not breathe gas/fumes/ vapor/spray. Never add water to this product. In case of insufficient ventilation, wear suitable respiratory equipment. If ingested, seek medical advice immediately and show the container or the label. Avoid contact with skin and eyes. Keep away from incompatibles such as oxidizing agents, organic materials, metals, alkalis, moisture. May corrode metallic surfaces. Store in a metallic or coated fiberboard drum using a strong polyethylene inner package.

Storage: Keep container tightly closed. Keep container in a cool, well-ventilated area.

Section 8: Exposure Controls/Personal Protection

Engineering Controls:

Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapors below their respective threshold limit value. Ensure that eyewash stations and safety showers are proximal to the work-station location.

Personal Protection:

Face shield. Full suit. Vapor respirator. Be sure to use an approved/certified respirator or equivalent. Gloves. Boots.

Personal Protection in Case of a Large Spill:

Splash goggles. Full suit. Vapor respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits:

CEIL: 5 (ppm) from OSHA (PEL) [United States] CEIL: 7 (mg/m³) from OSHA (PEL) [United States] CEIL: 5 from NIOSH CEIL: 7 (mg/m³) from NIOSH TWA: 1 STEL: 5 (ppm) [United Kingdom (UK)] TWA: 2 STEL: 8 (mg/m³) [United Kingdom (UK)] Consult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Liquid.

Odor: Pungent. Irritating (Strong.)

Taste: Not available.

Molecular Weight: Not applicable.

Color: Colorless to light yellow.

pH (1% soln/water): Acidic.

Boiling Point:

108.58 C @ 760 mm Hg (for 20.22% HCl in water) 83 C @ 760 mm Hg (for 31% HCl in water) 50.5 C (for 37% HCl in water)

Melting Point:

-62.25°C (-80°F) (20.69% HCl in water) -46.2 C (31.24% HCl in water) -25.4 C (39.17% HCl in water)

Critical Temperature: Not available.

Specific Gravity:

1.1- 1.19 (Water = 1) 1.10 (20%and 22% HCl solutions) 1.12 (24% HCl solution) 1.15 (29.57% HCl solution) 1.16 (32% HCl solution) 1.19 (37% and 38%HCl solutions)

Vapor Pressure: 16 kPa (@ 20°C) average

Vapor Density: 1.267 (Air = 1)

Volatility: Not available.

Odor Threshold: 0.25 to 10 ppm

Water/Oil Dist. Coeff.: Not available.

Ionicity (in Water): Not available.

Dispersion Properties: See solubility in water, diethyl ether.

Solubility: Soluble in cold water, hot water, diethyl ether.

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Incompatible materials, water

Incompatibility with various substances:

Highly reactive with metals. Reactive with oxidizing agents, organic materials, alkalis, water.

Corrosivity:

Extremely corrosive in presence of aluminum, of copper, of stainless steel(304), of stainless steel(316). Non-corrosive in presence of glass.

Special Remarks on Reactivity:

Reacts with water especially when water is added to the product. Absorption of gaseous hydrogen chloride on mercuric sulfate becomes violent @ 125 deg. C. Sodium reacts very violently with gaseous hydrogen chloride. Calcium phosphide and hydrochloric acid undergo very energetic reaction. It reacts with oxidizers releasing chlorine gas. Incompatible with, alkali metals, carbides, borides, metal oxides, vinyl acetate, acetylides, sulphides, phosphides, cyanides, carbonates. Reacts with most metals to produce flammable Hydrogen gas. Reacts violently (moderate reaction with heat of evolution) with water especially when water is added to the product. Isolate hydrogen chloride from heat, direct sunlight, alkalies (reacts vigorously), organic materials, and oxidizers (especially nitric acid and chlorates), amines, metals, copper and alloys (e.g. brass), hydroxides, zinc (galvanized materials), lithium silicide (incandescence), sulfuric acid(increase in temperature and pressure) Hydrogen chloride gas is emitted when this product is in contact with sulfuric acid. Adsorption of Hydrochloric Acid onto silicon dioxide results in exothermic reaction. Hydrogen chloride causes aldehydes and epoxides to violently polymerize. Hydrogen chloride or Hydrochloric Acid in contact with the following can cause explosion or ignition on contact or

Special Remarks on Corrosivity:

Highly corrosive. Incompatible with copper and copper alloys. It attacks nearly all metals (mercury, gold, platinum, tantalum, silver, and certain alloys are exceptions). It is one of the most corrosive of the nonoxidizing acids in contact with copper alloys. No corrosivity data on zinc, steel. Severe Corrosive effect on brass and bronze

Polymerization: Will not occur.

Section 11: Toxicological Information

Routes of Entry: Absorbed through skin. Dermal contact. Eye contact. Inhalation.

Toxicity to Animals:

Acute oral toxicity (LD50): 900 mg/kg [Rabbit]. Acute toxicity of the vapor (LC50): 1108 ppm, 1 hours [Mouse]. Acute toxicity of the vapor (LC50): 3124 ppm, 1 hours [Rat].

Chronic Effects on Humans:

CARCINOGENIC EFFECTS: Classified 3 (Not classifiable for human.) by IARC [Hydrochloric acid]. May cause damage to the following organs: kidneys, liver, mucous membranes, upper respiratory tract, skin, eyes, Circulatory System, teeth.

Other Toxic Effects on Humans:

Very hazardous in case of skin contact (corrosive, irritant, permeator), of ingestion, . Hazardous in case of eye contact (corrosive), of inhalation (lung corrosive).

Special Remarks on Toxicity to Animals:

Lowest Published Lethal Doses (LDL/LCL) LDL [Man] -Route: Oral; 2857 ug/kg LCL [Human] - Route: Inhalation; Dose: 1300 ppm/30M LCL [Rabbit] - Route: Inhalation; Dose: 4413 ppm/30M

Special Remarks on Chronic Effects on Humans:

May cause adverse reproductive effects (fetotoxicity). May affect genetic material.

Special Remarks on other Toxic Effects on Humans:

Acute Potential Health Effects: Skin: Corrosive. Causes severe skin irritation and burns. Eyes: Corrosive. Causes severe eye irritation/conjunctivitis, burns, corneal necrosis. Inhalation: May be fatal if inhaled. Material is extremely destructive to tissue of the mucous membranes and upper respiratory tract. Inhalation of hydrochloric acid fumes produces nose, throat, and laryngeal burning, and irritation, pain and inflammation, coughing, sneezing, choking sensation, hoarseness, laryngeal spasms, upper respiratory tract edema, chest pains, as well as headache, and palpitations. Inhalation of high concentrations can result in corrosive burns, necrosis of bronchial epithelium, constriction of the larynx and bronchi, nasospetal perforation, glottal closure, occur, particularly if exposure is prolonged. May affect the liver. Ingestion: May be fatal if swallowed. Causes irritation and burning, ulceration, or perforation of the gastrointestinal tract and resultant peritonitis, gastric hemorrhage and infection. Can also cause nausea, vomiting (with "coffee ground" emesis), diarrhea, thirst, difficulty swallowing, salivation, chills, fever, uneasiness, shock, strictures and stenosis (esophageal, gastric, pyloric). May affect behavior (excitement), the cardiovascular system (weak rapid pulse, tachycardia), respiration (shallow respiration), and urinary system (kidneys- renal failure, nephritis). Acute exposure via inhalation or ingestion can also cause erosion of tooth enamel. Chronic Potential Health Effects: dyspnea, bronchitis. Chemical pneumonitis and pulmonary edema can also

Section 12: Ecological Information

Ecotoxicity: Not available.

BOD5 and COD: Not available.

Products of Biodegradation:

Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The products of degradation are less toxic than the product itself.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:

Waste must be disposed of in accordance with federal, state and local environmental control regulations.

Section 14: Transport Information

DOT Classification: Class 8: Corrosive material

Identification: : Hydrochloric acid, solution UNNA: 1789 PG: II

Special Provisions for Transport: Not available.

Section 15: Other Regulatory Information

Federal and State Regulations:

Connecticut hazardous material survey.: Hydrochloric acid Illinois toxic substances disclosure to employee act: Hydrochloric acid Illinois chemical safety act: Hydrochloric acid New York release reporting list: Hydrochloric acid Rhode Island RTK hazardous substances: Hydrochloric acid Pennsylvania RTK: Hydrochloric acid Minnesota: Hydrochloric acid Massachusetts RTK: Hydrochloric acid Massachusetts spill list: Hydrochloric acid New Jersey: Hydrochloric acid New Jersey spill list: Hydrochloric acid Louisiana RTK reporting list: Hydrochloric acid Louisiana spill reporting: Hydrochloric acid California Director's List of Hazardous Substances: Hydrochloric acid TSCA 8(b) inventory: Hydrochloric acid TSCA 4(a) proposed test rules: Hydrochloric acid SARA 302/304/311/312 extremely hazardous substances: Hydrochloric acid SARA 313 toxic chemical notification and release reporting: Hydrochloric acid CERCLA: Hazardous substances.: Hydrochloric acid: 5000 lbs. (2268 kg)

Other Regulations:

OSHA: Hazardous by definition of Hazard Communication Standard (29 CFR 1910.1200). EINECS: This product is on the European Inventory of Existing Commercial Chemical Substances.

Other Classifications:

WHMIS (Canada):

CLASS D-2A: Material causing other toxic effects (VERY TOXIC). CLASS E: Corrosive liquid.

DSCL (EEC):

R34- Causes burns. R37- Irritating to respiratory system. S26- In case of contact with eyes, rinse immediately with plenty of water and seek medical advice. S45- In case of accident or if you feel unwell, seek medical advice immediately (show the label where possible).

HMIS (U.S.A.):

Health Hazard: 3

Fire Hazard: 0

Reactivity: 1

Personal Protection:

National Fire Protection Association (U.S.A.):

Health: 3

Appendix H

Pilot Scale Treatment Studies H &S Guidelines

Appendix H - Pilot Scale Treatment Studies for Soil

Several bench scale tests have been conducted to assess the effectiveness of treating soil from the Garfield Avenue Site. Large scale testing of “pilot” testing is now proposed. The pilot scale testing will be conducted on-site using a much larger volume of soil compared to the bench testing. The pilot scale testing has the following general objectives:

- Determine the treatment effectiveness on a larger scale under realistic conditions;
- Determine on what soil types/material the process is most effective. Evaluating the effectiveness on COPR nodules is a key goal of the pilot study;
- Obtain process data to be used in full-scale design;
- Obtain data to be used in estimating costs for full-scale design; and
- Obtain additional data to help define what constitutes successful treatment.

The following pilot scale tests for soil treatment are proposed:

- Ex-Situ treatment of backfill using FerroBlack-H. The primary treatment reagents are ferrous sulfide (“FeS”).
- In-Situ treatment of soil using the process developed by ARCADIS. This process involves chemical weathering of the COPR minerals to mitigate alkalinity over the long-term, access hexavalent chromium incorporated in the mineral matrix, and disaggregate nodules of COPR material to support more effective treatment. This is coupled with chemical and biological reduction of the incorporated hexavalent chromium to permanently stabilize it, rendering the material safe as measured by acceptable methods. Treatment reagents are primarily sulfuric acid (“H₂SO₄”), ferrous sulfate (“FeSO₄”), a fermentable organic substrate and inoculum to stimulate anaerobic microbial activity.

The processes are described in more detail in the Technical Execution Plans for each study. The treated soil from each scenario will be maintained in approximately 600 cubic yard cells on-site for post-treatment testing.

2.0 Overall Site Safety Inspection

Activity at the site will consist of four separate areas for differing pilot studies, areas of excavation, soil stockpile areas, groundwater storage areas, parking, and field trailer areas. Given the variety of activities being conducted, a daily inspection of all areas to avoid potential cross-contamination and assure HASP requirements are met will be necessary.

Daily Inspections will be performed to ensure:

Pilot Study Treatment Areas

- The area is clearly marked and all chemicals and equipment are within the designated area;
- Any chemicals not associated with and not designated to be in this area are not present;
- Chemical containers are clearly and correctly marked;
- Tanks and double containment structures are in good shape and there is no evidence of leaks;

- Chemical containers that require ventilation are adequately vented;
- No un-cleaned or partially filled containers are present in the work areas; containers must be completely emptied and cleaned immediately after use;
- If work is underway, it is being conducted in accordance with the activity specific Job Safety Analysis (“JSA”) or Task Hazard Analysis (“THA”);
- If work is underway, one person has been designated as Site Safety Officer (“SSO”) for that work and is overseeing the work;
- All personnel in the area are aware of the JSA/THA requirements, are wearing the appropriate personal protective equipment (“PPE”), and are following JSA/THA requirements;
- Air monitoring is taking place as directed; and
- The area is neatly organized; no trash and/or no trip/fall hazards are present.

Excavation Areas

- Areas are clearly marked;
- Open excavations, if any, are marked with caution tape or barricaded;
- Safe trench/excavation procedures are being followed;
- No unauthorized personnel are in the work area;
- Authorized personnel are using proper signals around equipment;
- Appropriate PPE is being worn;
- Air monitoring is taking place as directed;
- All personnel in the area are familiar with the JSA/THA and following JSA/THA procedures;
- Equipment is working in the area following proper procedures; and
- Appropriate oversight by safety designated staff is being conducted.

3.0 Backfill Amendment Pilot Study FerroBlack-H Treatment

The backfill amendment pilot study will be conducted in a 30-foot by 30-foot cell. A layout for the calcium polysulfide (“CaSx”) treatment is shown in the Backfill Amendment Technical Execution Plan. The pilot study testing will include the following steps:

- Selection of an appropriate test location: The cell will be fully excavated to meadow mat and backfilled with an amended fill material.
- Pre-treatment testing of soils: This will include analytical testing of chromium (totals analysis and Synthetic Precipitation Leaching Procedure (“SPLP”)), percent COPR by field screening, soil grain size by laboratory analysis, volatile organic compounds (“VOCs”) and semi- volatile organic compounds (“SVOCs”), Target Analyte List (“TAL”) metals, pH, and baseline physical properties testing.
- Blending of reagents: Using the pretreatment data on hexavalent chromium, the mass of treatment reagents to be applied will be determined. The stoichiometric blend will be 3X for FeS. Soil will be blended using an excavator bucket to loosen soils, blending.

- Testing to confirm adequate blending: Samples will be collected to confirm even distribution of the FerroBlack-H.
- Initial testing to assess effectiveness and physical properties.
- Post Treatment Monitoring.

The use of FeS for treatment of hexavalent chromium in soil and groundwater is a fairly widely accepted process. Full-scale in-situ projects with this general chemistry have been conducted at several sites.

3.1 Scope of Work

Mobilization will occur after the IRM #1 work is completed. An area north of the IRM #1 will be designated for the Backfill Amendment treatment process. As a result of the IRM #1 work, the site will already be equipped with a construction trailer, soil erosion measures, decontamination pads, stockpile areas, etc. The IRM #1 work will result in the removal of building slabs and other large debris from the area. The test location will not include Green-Gray Mud. A cell 30 feet wide, 30 feet long and 18 feet deep (to depth of meadow mat) will be constructed. After development of a site specific HASP for the pilot study, the following activities will be conducted:

- Conduct a kick off meeting among PPG, AECOM, and the construction contractor regarding the site controls. Reagent blending operations will be conducted by a construction contractor under the supervision of AECOM.
- Conduct a kick off meeting with site personnel to ensure that site health and safety hazards are understood and emergency procedures are reviewed.
- Construct a chemical storage area for Ferro-Black-H. Ferro-Black will be delivered in a tanker truck and stored on-site in one 5,000-gallon plastic tank. The tank will be installed within secondary containment. The tank will be outfitted with agitators to prevent the material from settling.
- Mobilize heavy equipment to the site. Heavy equipment is expected to include an excavator with a standard bucket attachment for mixing.
- It should be possible to gravity feed the treatment solutions into the mixing cell. Hoses and a metering system will be set-up.
- A temporary soil stockpile area (lined and covered) will be constructed within the pilot test cell area.

3.2 Process Health and Safety Concerns

The health and safety concerns associated with the FerroBlack-H treatment process are as follows:

- Reaction/ incompatibilities of reagents used in the treatment process;
- Proper handling of reagents used in the treatment process;
- Working around construction equipment including excavator and front-end loader;
- Temporary electrical supply; and
- Workers' exposure to impacted soil COPR, hexavalent chromium and off gases.

3.3 Chemical Reagents

Redox® FerroBlack-H is black liquid that is a ferrous sulfide solution with a pH between 9.5 and 12.3. FerroBlack-H can irritate the eyes, and mucous membranes. Skin contact will result in irritation and possible corrosion of the skin. Ingestion will irritate/burn mouth, throat and gastrointestinal tract. There is no occupational exposure level for FerroBlack-H and/or ferrous sulfide. FerroBlack-H is incompatible with strong acids, metal oxides, and strong bases decomposing into hydrogen sulfide.

FerroBlack-H must be stored in a well ventilated area away from combustible materials, sources of heat or flame and out of direct sunlight at moderate temperature (<80° F). FerroBlack-H will be stored on site in a 5,000-gallon double walled plastic tank. The tank containment must be protected from physical damage. The tank of FerroBlack-H must be properly labeled as to its content and hazards using the manufacturers' labels or a 704M label specific for the material is considered to be an acceptable label (H/0, F/0, R/2). All containers of FerroBlack-H must be labeled in accordance with the Occupational Safety and Health Administration's ("OSHA's") Hazard Communication Standard. The Material Safety Data Sheet ("MSDS") for ferrous sulfide must be readily available on site. The fitting used for the transfer of FerroBlack-H must be unique and not compatible with other fittings, (i.e. water).

3.4 Engineering/Work Practice Controls

Engineering controls will consist of the following:

- Proper storage and protection of chemical reagents;
- Secondary containment for liquid chemical reagents;
- Use of material compatible with the chemical reagents;
- Covering of soil stock piles with poly sheeting;
- Use of dust control agents (water) to prevent dusting;
- Use of water mist to prevent dusting at soil blending area;
- Designation of a exclusion zone ("EZ"), contamination reduction zone ("CRZ") and support zone; and
- Installation of a safety drench shower/eyewash meeting ANSI standards in the area where chemicals are handled/stored.

Work practice controls will consist of the following:

- Twenty-four hour security coverage of the site;
- Fenced in site;
- Implementation of a sign-in/sign-out procedure;
- Limit the number of workers in the EZ;
- Daily inspection of process equipment and reagent storage tanks;
- Limit the number of vehicles on site to reduce the chance of collisions, and establish hand signals for workers;
- Limit the dump height of impacted soils to prevent the generation of dust;
- Slow equipment movement down to prevent the generation of dust;
- Daily inspection of construction equipment;
- Maintaining an upwind position;

- No eating, drinking, or applying cosmetics while in the EZ; and
- Implementation of decontamination procedures for personnel and equipment that enter the EZ.

3.5 Personal Protective Equipment

To protect workers from accidental splash or inhalation of gases, mists or vapors, chemical resistant garments and respiratory protection will be used when handling or transferring chemicals. The use of PPE is also necessary to protect workers from contaminants of concern, COPR and hexavalent chromium during soil excavation.

Modified Level D protection is recommended for activities where respirator protection is not required and maybe limited to handling of reagents when splash is anticipated. Level D modified protection will consist of the following in addition to Level D protection:

- Chemical-resistant overalls (Tychem QC- chemical splash) or neoprene apron
- Inner gloves: Best Safety N-DEX or equivalent
- Outer gloves: Ansell-Edmont SOL-VEX (Nitrile) or equivalent
- Over boots (rubber)
- Safety glasses
- Full face splash shield worn over safety glasses

Level D protection is recommended for activities where respirator and dermal protection is not required. Level D modified protection will consist of the following:

- Hardhat
- High visibility vest
- Steel toe protective foot wear
- Safety glasses
- Shirt with sleeves
- Long pants

3.6 Air Monitoring

3.6.1 Dust/Hexavalent Chromium

The TSI DustTrak and DataRAM Model DR 1000 Aerosol Monitors (or equivalent) measures concentrations of airborne dust, smoke, mists, haze and fumes with real-time readout. The instrument can be used for exposure sampling of ambient air, during intrusive work. TSI DustTrak Aerosol Monitors will be to measure the upwind and downwind concentrations of particulates at the perimeter of the EZ, while personal aerosol monitors (such as the DataRAM DR 1000 or equivalent) will be used to monitor worker exposure within the EZ.

A personal exposure level was calculated and measured in milligrams per cubic meter (mg/m^3) on an 8-hour Time Weighted Average (TWA_8) based on contaminants of concern (hexavalent chromium) which has the lowest occupational exposure ($0.005 \text{ mg}/\text{m}^3 \text{ TWA}_8$) of the potential dust producing substances such as Portland cement and ferrous sulfide. It is recognized that respirable dust particles are generally not visible to the naked eye, but a total airborne dust clouds is often visible at concentrations of $2 \text{ mg}/\text{m}^3$. Since visible dust is not acceptable, a dust action of $0.167 \text{ mg}/\text{m}^3$ will be used as the dust action level for upgrading to Level C.

3.6.2 Hydrogen Sulfide

The soil treatment may generate hydrogen sulfide under acidic conditions. Hydrogen sulfide will be measured using a single gas monitor such as the BW Tech Gas Alert or equivalent specifically for hydrogen sulfide (H₂S). Measurement for hydrogen sulfide will be made on an intermittent basis inside and outside the EZ and outside the during the treatability study.

If any hand-held hydrogen sulfide instantaneous levels exceed 5 parts per million (“ppm”) for a sustained 15 minute period, workers should relocate to an area where the airborne concentration of hydrogen sulfide is less than 5 ppm. A full face air purifying respirator (APF- 50) equipped with combination organic vapor/acid gas cartridge with an N-100 filter is recommended and approved for escape only in an atmosphere containing hydrogen sulfide.

3.6.3 Calibration

The Aerosol Monitors will be field checked daily using zero calibration air. At the beginning of each workday (prior to site intrusive activities each day) a calibration zero check will be performed on each unit at the measurement locations. A zero (or particulate-free) test sample, using the appropriate particulate filter supplied by the manufacturer for this purpose, will be placed over the sample inlet. The data output for the monitor will be observed and the response recorded in a field logbook.

Prior to each measurement session, an on-site dynamic calibration of the hydrogen sulfide monitor will be performed against a known hydrogen sulfide calibration gas. The daily calibration will also include a dynamic zero air check of the instrument. The data output for the monitor will be observed and the response recorded in a field logbook.

3.6.4 Personal Air Sampling

Personal exposure assessment may be conducted for hexavalent chromium/total dust if the dust action level is exceeded during the task or if the task is determined to be “high-risk” for personal exposure. Personal air samples will be collected in accordance with OSHA and/or National Institute for Occupational Safety and Health (“NIOSH”) methodology and analyzed by an American Industrial Hygiene Association (“AIHA”) accredited laboratory. The results of the sampling will be communicated to project personnel. The number of workers selected to wear the personal sampling pumps will be determined in advance of the field activity by AECOM’s RSHEM. Personal hydrogen sulfide monitor will be performed on at risk employees by using a clip on disposable hydrogen sulfide detector with a low alarm range of 5 ppm.

3.6.5 Analytical Methods

- Hexavalent Chromium- 29 CFR 1910.1026(d)-Analytical Method OSHA ID-215
- Dust-NIOSH Analytical Method- 0500

3.6.6 Task-Specific Job Safety Analysis

Specific JSA’s/THAs will be prepared for the following:

- Chemical handling/blending
- Soil handling
- In-situ soil blending
- Equipment operation
- Soil/groundwater sampling

4.0 ARCADIS In Situ Soil Treatment Process

The in situ treatment process being proposed by ARCADIS is a patent pending multi-step process intended to systematically address the primary restrictions that generally inhibit COPR remediation.

The initial step involves the careful addition of a mineral acid (sulfuric acid). This is meant to decrease the pH from approximately 12 to an approximate pH of 9 by accelerating weathering of the primary minerals that are the source of the alkalinity and are also responsible for the cementation and bulking often observed with COPR. This liberates hexavalent chromium that was sequestered in these minerals, making it available for treatment, and begins the process of long-term stabilization of pH. In addition to the acid, this step also involves the addition of ferrous iron (in the form of ferrous sulfate) to support immediate reduction of hexavalent chromium on the surfaces of the solids and in pore water as well as providing an accessible source of renewable reductive poise. This chemical reduction component continues the process of displacing hexavalent chromium, weathering parent minerals, and stabilizing pH.

The second step involves the delivery of a fermentable source of organic carbon in conjunction with an inoculum that will help accelerate the stimulation/propagation of anaerobic microbial activity (i.e., sludge from an anaerobic digester). This creates a strongly anaerobic environment and a very efficient source of electrons for hexavalent chromium reduction. As part of this, the iron delivered in the first step can go through multiple cycles of reduction and oxidation, helping to accelerate treatment of the hexavalent chromium. This iron can be supplemented with the addition of more iron in this step, which coupled with acidity generated by microbial fermentation continues the process of displacing hexavalent chromium, weathering parent minerals, and stabilizing pH.

4.1 Scope of Work

For this field test, in-situ soil mixing will be used to deliver amendments associated with each of the process phases. Conceptually, this will be accomplished with pairing of a dual-axis soil mixer (a.k.a. Lang LTC290) and a long-stick hydraulic bucket excavator. The Lang tool utilizes a mixing drum with two counter-rotating parts mounted at the tip of a vertical rotating shaft. Amendments are prepared as a liquid or slurry in a separate mixing station, and are pumped to the tip of the shaft in the middle of the mixing drum. The soil is thus treated in-situ in a 5-foot diameter vertical column. The whole treatment area can be covered in a series of overlapping columns or other patterns. An excavator would provide a back up for areas where debris in the subsurface makes it difficult for the Lang tool to operate. This would involve the use of bucket mixing for selective removal of debris and loosening of the soil, such that workability is improved and the Lang tool can be re-applied. Where debris is too dense, completion of the mixing could also proceed via bucket mixing alone. Bucket mixing alone can also be used for the biogeochemical and geotechnical stabilization treatments. In addition to the Lang tool and an excavator, other support equipment that may also be mobilized to the site includes a front-end loader, dump truck, and tender for the Lang tool.

In conjunction with the mobilization of equipment, there are several site preparation tasks that will be completed prior to initiating the soil treatment activities, as follows:

- Setup of the treatment cell: The cell will be created by installation of a 25 foot long x 20 foot wide x 15 foot deep sheetpile wall, with the top of the sheeting terminated at a depth of approximately 5 feet (just above the groundwater interface). The sheetpile wall will physically contain the treatment zone and will provide a hydraulic barrier between treated and untreated material below the water table. Within the cell, the top 3 feet of soil will be removed and the sides worked back at a 1:1 slope. This will provide freeboard to accommodate expansion of the soils being stabilized (due to bulking). A 2 foot wide x 2 foot deep pea-gravel filled trench will be built around the perimeter of the sheeting to collect and drain excess fluids during the mixing process. This will also assist in post-mixing consolidation of the treated material and will demarcate a buffer around the sheeting for the mixing process (at least 2 feet clearance from the sheetpile wall will be maintained during mixing). Based on this layout, the effective treatment volume will be approximately 160 cubic yards.

- Set-up of the construction support area: This will involve creation of several level areas covered with crushed stone to provide for equipment staging, materials staging, waste management, and personnel support as follows:
 - The equipment staging area will be separate from the materials staging area and will be used to stage equipment between mixing efforts. Equipment will ultimately be decontaminated in this staging area prior to leaving the site.
 - The materials staging area will be used for general materials laydown and staging of all treatment reagents other than acid. It is anticipated that this will include the following:
 - Molasses will be used as the fermentable source of organic carbon in the treatment process. Based on the planned dosing, molasses could be delivered by tanker or handled in a series of 275-gallon plastic totes with a pump suitable for moving high-viscosity fluids.
 - Granular ferrous sulfate will be used in the form of ferrous sulfate heptahydrate. This can be delivered in super sacks that must be kept dry until used. While it is anticipated that storage timeframes will be minimized by coordinating delivery with use, the iron will be covered as needed with a weatherproof tarp that is sufficiently anchored to prevent it from coming loose.
 - A specific source for the biological inoculant remains to be identified, but will likely involve a limited amount of sludge from an anaerobic digester. This can be staged in lined containers (drums or roll-off).
 - The waste management area will consist of a separate area set aside from the materials staging area. General wastes from the site activities will be containerized in the waste management area and stored for disposal.
 - The personnel support area will include a safety shower/decontamination area, and a clean zone for breaks. All personnel will enter and exit the work zone through this support area. An attempt will be made to stage this support area upwind of the work area and acid storage area based on prevailing wind directions.
- Setup of the acid storage and conveyance area: The titration of soils in the treatment area will be done with up to a 50% solution of sulfuric acid, the handling of which requires the utmost care and attention to safety. As envisioned, configuration of this area has been designed to minimize both the handling and the proximity of site workers to the acid solution. This will involve the following:
 - Staging of the acid will only be needed for a short time given that the titration step is expected to be completed within one week of initiation (discussed further below). Regardless, the local fire department and emergency services will be alerted so they can be prepared in the event of an incident.
 - A chemically compatible temporary containment structure that complies with applicable guidelines will be erected for the acid storage. Based on the planned dosing, it is anticipated that a number of tanker deliveries will be required. It is envisioned that each tanker will be dropped in the containment, and connected to the conveyance system. When the first tanker is empty, it will be disconnected, removed from the containment, and replaced with the next tanker.
 - Due to their composition, the site soils will provide sufficient alkalinity to neutralize incidental spills of acid, something that the configuration of the storage and conveyance system should prevent. However, a stockpile of acid neutralizing material (crushed limestone) will be maintained at the site for use in the event of a large release inside the containment (the acidic solution in the containment can be drained through the neutralizing material in a controlled manner).

- From the secondary containment, chemically compatible dual-walled piping supported by steel pipe stands will be used to convey the acid by gravity flow to the work area. This line will be equipped with a control valve at the containment bulkhead and at the discharge end. It will also be equipped with a chemically compatible flow totalizer, siphon break (to allow the line to drain down when the control valve is closed), and will have a tie-in to a clean water tank to flush the line after each use. Procedures for the actual loading of acid into the work area are discussed in Section 8.3.4 of the Feasibility Study work plan.

The estimated amounts of the various reagents that will be required to complete the field test include: up to 10,000 gallons of 50% sulfuric acid solution, 15 tons of ferrous sulfate, 15 tons of molasses, and 250 pounds of activated sludge. These estimates will be refined based on the results of the pre-testing data collection. Once the site preparation tasks are complete and all equipment is on site, the initial process pass will be initiated. This is discussed in the next section.

4.2 Process Health and Safety Concerns

The health and safety concerns associated with the ARCADIS, soil treatment process are as follows:

- Reaction/ incompatibilities of reagents {acids and base} used in the treatment process;
- Proper handling of reagents used in the treatment process;
- Temporary electrical supply;
- In-situ blending with Lang tool and excavator bucket;
- Workers' exposure to impacted soil COPR, hexavalent chromium;
- Off gases from treatment process (Carbon Dioxide, Carbon Monoxide, and Sulfur Dioxide); and
- Excavation which includes placing treated material in the treatment cell.

4.3 Chemical Reagents

Sulfuric acid is a clear oily liquid corrosive liquid with no odor. Sulfuric acid is a highly corrosive substance with a pH of 0.3. Sulfuric acid can cause server eye and skin burns. Ingestion of sulfuric acid may cause severe and permanent damage to the digestive tract. Causes gastrointestinal tract burns. When inhaled sulfuric acid mist may cause irritation of the respiratory tract with burning pain in the nose and throat, coughing, wheezing, shortness of breath and pulmonary edema. Causes chemical burns to the respiratory tract. Inhalation may be fatal as a result of spasm, inflammation, edema of the larynx and bronchi, chemical pneumonitis and pulmonary edema. Sulfuric acid is very corrosive action to the mucous membranes.

Prolonged or repeated inhalation of sulfuric acid may cause kidney and lung damage. Prolonged or repeated skin contact may cause dermatitis. Prolonged or repeated inhalation may cause nosebleeds, nasal congestion, erosion of the teeth, perforation of the nasal septum, chest pain and bronchitis. Prolonged or repeated eye contact may cause conjunctivitis. Sulfuric acid may cause fetal effects and may cause cancer in humans. The OSHA Permissible Exposure Limit ("PEL") for sulfuric acid is 1 mg/m³ ppm as aTWA₈.

Sulfuric acid is incompatible with bases, strong dehydrating agents, organic materials, finely powdered metals, moisture, carbides, chlorates, cyanides (e.g. potassium cyanide, sodium cyanide), nitrates, alkali halides, zinc, iodides, permanganates, hydrogen peroxides, phosphorus, nitrites, iron, mercuric nitride, benzene, potassium chlorates, steel, cesium, and acetylene carbide. When combined with water, sulfuric acid will cause a violent reaction, releasing heat and flammable hydrogen gas. Conditions to avoid when using or storing sulfuric acid are incompatible materials, ignition sources, metals, excess heat, combustible materials, organic materials, reducing agents, exposure to moist air or water, oxidizers, amines, bases.

Containers of sulfuric acid must be properly labeled as to their content and hazards using the manufacturers' labels. Secondary containers must also be labeled as to their content and hazards using either the original manufacturer's label or an 704M label specific for the material is considered to be an acceptable label (H/4, F/0, R/2). All containers of sulfuric acid must be labeled in accordance with OSHA's Hazard Communication Standard. The MSDS for sulfuric acid must be readily available on site.

Sulfuric acid is not compatible with calcium polysulfide (CaS_x alone or CaS_x in the COPREX mix). Sulfuric acid is not compatible with sodium hydrosulfide ("NaSH"). Sulfuric acid will not be handled, stored, or applied in areas where CaS_x or NaSH may be present.

Ferrous sulfate is characterized by its blue green crystal. Ferrous sulfate causes irritation to the respiratory tract, skin and eyes. Severe or chronic ferrous sulfate poisonings may damage blood vessels. Chronic exposure may cause liver effects. Prolonged exposure of the eyes may cause discoloration. The ACGIH recommends a Threshold Limit Value ("TLV") for ferrous sulfate (soluble iron) of 1 mg/m³ as aTWA₈. Ferrous sulfate is incompatible with alkalis, soluble carbonates and oxidizing material.

While in storage, ferrous sulfate must be protected from moisture and high humidity and protected from physical damage and isolated from incompatible substances. Maintain a constant temperature not to exceed 75° F. Fluctuating temperatures causes product oxidation. Do not use this product if coated with brownish-yellow basic ferrous sulfide. Containers of ferrous sulfate must be properly labeled as to their content and hazards using the manufacturers' labels. Secondary containers must also be labeled as to their content and hazards using either the original manufacturer's label or an NFPA 704M label specific for the material is considered to be an acceptable label (H/1, F/0, R/0). All containers of ferrous sulfate must be labeled in accordance with OSHA's Hazard Communication Standard. The material safety data sheet for ferrous sulfate must be readily available on site.

4.4 Engineering/Work Practice Controls

Engineering controls will consist of the following:

- Proper storage and protection of chemical reagents;
- Secondary containment for liquid chemical reagents;
- Use of material compatible with the chemical reagents;
- Covering of soil stock piles with poly sheeting;
- Use of dust control agents to prevent dusting;
- Use of water mist to prevent dusting at blending site;
- Designation of an EZ, CRZ and support zone; and
- Installation of a safety drench shower/eyewash meeting ANSI standards in the area where chemicals are handled/stored.

Work practice controls will consist of the following:

- Twenty-four hour security coverage of the site;
- Fenced in site;
- Implementation of a sign-in/sign out procedure;
- Limit the number of workers in the EZ;
- Daily inspection of process equipment and reagent storage tanks;

- Limit the number of vehicles on site to reduce the chance of collisions, and establish hand signals for workers;
- Limit the dump height of impacted soils to prevent the generation of dust;
- Slow equipment movement down to prevent the generation of dust;
- Daily inspection of construction equipment;
- Maintaining an upwind position;
- No eating, drinking, or applying cosmetics while in the EZ; and
- Implementation of decontamination procedures for personnel and equipment that enter the EZ.

4.5 Personal Protective Equipment

To protect workers from accidental splash or inhalation of gases, mists or vapors, chemical resistant garments and respiratory protection will be used when handling or transferring chemicals. The use of PPE is also necessary to protect workers from contaminants of concern, COPR and hexavalent chromium during soil handling and preparation.

Based on the hazardous properties of the chemical reagents and contaminants of concern Level C PPE is recommended for work inside the EZ. Level C protection will consist of the following:

- Hardhat ;
- High visibility vest;
- Steel toe protective foot wear;
- Hearing protection;
- Full face air purifying respirator (APF- 50) equipped with combination organic vapor/acid gas cartridge with an N-100 filter;
- Chemical-resistant overalls (Tychem QC- chemical splash);
- Inner gloves: Best Safety N-DEX or equivalent;
- Outer gloves: Ansell-Edmont SOL-VEX (Nitrile) or equivalent; and
- Over boots (rubber).

Respirator cartridges must be changed after each day's use, immediately if breakthrough is perceived, or when breathing becomes difficult. Chemical resistant coveralls and outer gloves must be properly disposed of after each use. If chemical resistant glove or coverall become ripped or show signs of swelling or failure, the person should immediately leave the area, remove the protective equipment and immediately notify the SSO of the potential exposure. It is the responsibility of each employee to inspect their PPE for defects prior to donning. Defective PPE must be replaced.

The SSO, with concurrence from the PM and RSHEM, may down grade the level of protection based on air monitoring results, observation of work practices or hazardous assessment. Down grading of PPE may occur if the use PPE poses a safety hazard (i.e. heat stress, entanglement).

Modified Level D protection is recommend for activities where respirator protection is not required and maybe limited to handling of reagents when splash is anticipated. Modified Level D modified protection will consist of the following:

- Chemical-resistant overalls (Tychem QC- chemical splash) or neoprene apron
- Inner gloves: Best Safety N-DEX or equivalent
- Outer gloves: Ansell-Edmont SOL-VEX (Nitrile) or equivalent
- Over boots (rubber)
- Safety glasses
- Full face splash shield worn over safety glasses

Level D protection is recommended for activities where respirator and dermal protection is not required. Level D modified protection will consist of the following:

- Hardhat
- High visibility vest
- Steel toe protective foot wear
- Safety glasses
- Shirt with sleeves
- Long pants

4.6 Air Monitoring

4.6.1 Dust/Hexavalent Chromium

The TSI DustTrak and DataRAM Model DR 1000 Aerosol Monitors (or equivalent) measures concentrations of airborne dust, smoke, mists, haze and fumes with real-time readout. The instrument can be used for exposure sampling of ambient air, during intrusive work. TSI DustTrak Aerosol Monitors will be to measure the upwind and downwind concentrations of particulates at the perimeter of the EZ, while personal aerosol monitors (such as the DataRAM DR 1000 or equivalent) will be used to monitor worker exposure within the EZ.

A personal exposure level was calculated base on contaminants of concern hexavalent chromium which has the lowest occupational exposure ($0.005 \text{ mg/m}^3 \text{ TWA}_8$) of the potential dust producing substances such as Portland cement and ferrous sulfate. It is recognized that respirable dust particles are generally not visible to the naked eye, but a total airborne dust clouds is often visible at concentrations of 2 mg/m^3 . Since visible dust is not acceptable a dust action of 0.167 mg/m^3 will be used as the dust action level for upgrading to Level C. Regardless of the measured airborne concentration of dust in the workers breathing zone the initial level of protection will be Level C as described in Section 3.5.

4.6.2 Carbon Dioxide

During the naturalization process carbon dioxide gas may be emitted. Carbon dioxide gas is heavier than air, settling in low laying areas. Carbon dioxide is a simple asphyxiant that can displace oxygen. Carbon dioxide is the most powerful cerebral vasodilator known. Inhaling large concentrations causes rapid circulatory insufficiency leading to coma and death. Asphyxiation is likely to occur before the effects of carbon dioxide overexposure. Chronic, harmful effects are not known from repeated inhalation of low concentrations. Low concentrations of carbon dioxide cause increased respiration and headache. The OSHA PEL for carbon dioxide is 5000 ppm as a TWA_8 .

A carbon dioxide monitor such as the MultiRAE R or equivalent will be used to measure the airborne concentration of carbon dioxide in the breathing zone of workers in the EZ. In addition an oxygen monitor will be used to measure the percent of oxygen in the EZ. If the oxygen level is below 19.5%, this is considered an oxygen deficient atmosphere and workers should immediately leave the work area.

When the instantaneous levels of carbon dioxide is at or exceed 5000 ppm, workers should relocate to an area where the airborne concentration of carbon dioxide is less than 5000 ppm. The initial level of protection Level C respirator protection as described in **Section 4.5** must not be used in an atmosphere containing carbon dioxide.

When the instantaneous levels of oxygen is at or below 19.5% workers should relocate to an area where the airborne concentration of oxygen is greater than 19.5%. The initial level of protection Level C respirator protection as described in **Section 4.5** must not be used in an atmosphere containing less than 19.5% oxygen.

4.6.3 Carbon Monoxide

Carbon monoxide gas may also be generated during the naturalization process. Carbon monoxide is a colorless, odorless gas. The most common symptoms of CO poisoning are headache, dizziness, weakness, nausea, vomiting, chest pain, and confusion. High levels of CO inhalation can cause loss of consciousness and death. The ACGIH recommends a TLV for carbon monoxide is 25 ppm as aTWA₈.

A multi-gas meter such as the VRAE or equivalent will be used to measure the airborne concentrations of carbon monoxide and oxygen in the breathing zone of workers in the EZ. Multi-gas meters such as the VRAE can simultaneously measure oxygen, hydrogen sulfide and carbon monoxide.

When the instantaneous levels of carbon monoxide is at or above 25 ppm, workers should relocate to an area where the airborne concentration of carbon monoxide is less than 25 ppm. The initial level of protection Level C respirator protection as described in **Section 4.5** must not be used in an atmosphere containing carbon monoxide.

4.6.4 Sulfur Dioxide

Sulfur dioxide gas may also be generated during the naturalization process. Sulfur dioxide is a colorless gas with a pungent odor. The most common symptoms of sulfur dioxide are burning the nose and throat, and breathing difficulties with lung function changes over time. High levels of sulfur dioxide inhalation can cause loss of life. OSHA has established a PEL of 5 ppm as aTWA₈.

A multi-gas meter such as the VRAE or equivalent will be used to measure the airborne concentrations of sulfur dioxide in the breathing zone of workers in the EZ. Multi-gas meters such as the VRAE can simultaneously measure oxygen, hydrogen sulfide and carbon monoxide.

When the instantaneous levels of sulfur dioxide is at or above 0.25 ppm, workers should relocate to an area where the airborne concentration of carbon monoxide is less than 0.25 ppm.

4.6.5 Sulfuric Acid

Sulfuric acid gas may be liberated during the process. It is an odorless gas, which when inhaled, may cause irritation of the respiratory tract with burning pain in the nose and throat, coughing, wheezing, shortness of breath and pulmonary edema. Causes chemical burns to the respiratory tract. Inhalation may be fatal as a result of spasm, inflammation, edema of the larynx and bronchi, chemical pneumonitis and pulmonary edema. Sulfuric acid is very corrosive action to the mucous membranes.

Prolonged or repeated inhalation of sulfuric acid may cause kidney and lung damage. Prolonged or repeated skin contact may cause dermatitis. Prolonged or repeated inhalation may cause nosebleeds, nasal congestion, erosion of the teeth, perforation of the nasal septum, chest pain and bronchitis. Prolonged or repeated eye contact may cause conjunctivitis. Sulfuric acid may cause fetal effects and may cause cancer in humans. The OSHA PEL for sulfuric acid is 1 mg/m³ ppm as aTWA₈.

The Porta Sens II Gas Detector is capable of monitoring acid gases. When the instantaneous levels of acid gases is at or above 0.5 ppm, workers should relocate to an area where the airborne concentration of acid gases is less than 0.5 ppm.

4.6.6 Calibration

The Aerosol Monitors will be field checked daily using zero calibration air. At the beginning of each workday (prior to site intrusive activities each day) a calibration zero check will be performed on each unit at the measurement locations. A zero (or particulate-free) test sample, using the appropriate particulate filter

supplied by the manufacturer for this purpose, will be placed over the sample inlet. The data output for the monitor will be observed and the response recorded in a field logbook.

Prior to each measurement session, an on-site dynamic calibration of the carbon monoxide monitor and oxygen monitor will be performed according to the manufactures' directions. The data output for the monitor will be observed and the response recorded in a field logbook.

Prior to daily use the multi-gas meter or equivalent for carbon monoxide, sulfur dioxide, etc. will be bump tested in as a means of verifying calibration by using a known concentration of test gas (i.e. carbon monoxide). In addition the instrument will be calibrated in accordance with manufacturers' recommendations. The data output for the monitor will be observed and the response recorded in a field logbook.

4.6.7 Personal Air Sampling

Personal exposure assessment may be conducted for hexavalent chromium/total dust if the dust action level is exceeded during the task or if the task is determined to be "high-risk" for personal exposure. Personal air samples will be collect in accordance with OSHA and/or NIOSH methodology and analyzed by an AIHA accredited laboratory. The results of the sampling will be communicated to project personnel. The number of workers selected to wear the personal sampling pumps will be determined in advance of the field activity by AECOM's RSHEM. The RSHEM will also determine the need for personal monitoring of other gases including hydrogen sulfide, sulfuric acid, and sulfur dioxide using commercially available direct read instruments, Draeger Tubes or NIOSH Sampling Methods as appropriate.

4.6.8 Analytical Methods

- Hexavalent Chromium- 29 CFR 1910.1026(d)-Analytical Method OSHA ID-215
- Dust-NIOSH Analytical Method- 0500

4.7 Task-Specific Job Safety Analysis

Specific JSA's/THAs will be prepared for the following:

- Chemical handling/blending
- Soil handling
- Equipment operation
- Soil/groundwater sampling

5.0 Pilot Scale Treatment Studies for Groundwater and Saturated Soils

5.1 Introduction

Two types of pilot studies will be conduct to treat groundwater and saturated soils. Approximate locations for the studies are depicted in Figure 8-1 of the Feasibility Study Work Plan. In one test, the pilot study will use primary calcium polysulfide ("CaS_x and may include addition of FeS. The second approach will utilize a degradable organic carbon source to stimulate native sulfate- and iron-reducing microorganisms in situ, whose metabolic byproducts include ferrous iron (Fe(II)) and sulfides (H₂S, HS⁻) that react abiotically and reduce hexavalent chromium to trivalent chromium solids. The proposed locations and well infrastructure for these two studies are presented in Figures 9-1 and 9-7 of the Feasibility Study Work plan. Each of these processes is discussed in further detail below.

5.2 Process Description

Following excavation in the western portion of IRM#1, pilot studies of In-Situ Chemical Reduction/Geochemical Fixation (IRC) will be conducted in both the shallow zone and the intermediate zone. Note that the deep zone in this area is also impacted. Monitoring in the deep zone will be conducted to determine the combination of soil removal (IRM#1) and groundwater treatment in the shallow and deep zones results in an improvement in deep groundwater. For the shallow and deep zones, a primarily abiotic process and a primarily biologically mediated process will be tested. This approach will allow comparison of the two approaches and allow a comprehensive assessment of groundwater treatment methods for the Feasibility Study.

In general, the abiotic process works by adding a chemical reductant, such as CaSx, to react with hexavalent chromium to reduce hexavalent chromium to trivalent chromium. The chromium becomes insoluble and unavailable for dissolution into the groundwater. Thus, the concentration of total chromium dissolved in groundwater becomes significantly lower. The reduction process does not remove the chromium from the system but converts it to a less mobile form. The initial effectiveness and long-term effectiveness of the process depends on several variables. Changes in the geochemistry of the aquifer brought on by the reagents can, in some cases, lead to higher dissolved phase concentrations of some metals. The general objectives of the pilot studies are to determine short-term and long-term effectiveness at reducing chromium and to evaluate other impacts on groundwater quality.

The starting point for the abiotic pilot studies at Site will be the use of sulfur compounds, such as CaSx. These same reagents were used successfully in the bench top studies of soils discussed in Section 8 of the Work Plan. In those bench top studies, CaSx was shown to effectively reduce hexavalent chromium, immobilize trivalent chromium, and not to mobilize other metals. To further improve effectiveness, another additive has been selected for testing. After CaSx injection and initial testing, FeS will likely be added.

Depending on results from injection of CaSx additional treatment using FeS may be conducted. FeS has a low solubility in water and would be a persistent reductant. Addition of FeS may not be necessary if there is sufficient iron naturally occurring in the aquifer materials and sulfate reducing conditions prevail after CaSx addition alone. Tests will be conducted to determine the need for FeS addition.

While use of CaSx is expected to be effective, use of a primarily biological treatment may have advantages. One advantage would be avoiding an increase in the level of sulfate in the groundwater. Cost may be a second advantage. One of the more commonly used and successful biological treatments for hexavalent chromium is use of carbohydrate solutions. Sucrose and other sugars in the carbohydrate solutions are degraded by heterotrophic microorganism naturally occurring in the aquifer (or introduced). Consumption of the sugars leads to depletion of dissolved oxygen and to reducing conditions. Hexavalent chromium is then reduced to trivalent chromium which forms low solubility hydroxides.

5.3 Overall Sequence and Treatment Area Layout

The approximate areas for the two groundwater pilot studies are shown in Figure 8-1 of the Work Plan. Design and implementation will proceed sequentially as initial data is used to refine the next steps. The general sequence of work is as follows:

- Excavate soils in western portion of IRM #1;
- Collect post excavation soil samples, analyze for hexavalent chromium, review results;
- Select locations for monitoring wells based on soil results and historic groundwater data;
- Install monitoring wells and sample for parameters necessary for final determination of injection locations and for determining initial reagent blends;

- Install injection and extraction wells;
- Collect soil samples in intermediate zone during well installation to help refine reagent formulations (for example, determine if FeS is needed and establish baseline biological conditions);
- Begin extraction and injection processes, monitor processes using tracer and injection/extraction data, adjust processes as necessary;
- Achieve minimal pore volume goals;
- Test monitoring wells, injection wells, and extraction wells;
- Conduct additional injection of initial reagent formulation or modified reagent formulations as needed;
- Complete injection process;
- Resample saturated soils; and
- Conduct long-term monitoring.

The proposed layout for both groundwater pilot studies are similar same. Both treatment areas are approximately 80 by 110 feet in size. The treatment areas are surrounded by monitoring wells. The monitoring wells will be used to assess any interaction between the treatment zones and impacts from up-gradient areas. For the CaSx treatment, two centrally located extraction wells will be surrounded by 10 injection wells. Spacing for the extraction wells is approximately 40 feet. Spacing for the injection wells is approximately 20 feet.

For the biological treatment, no extraction wells will be used. The treatment solution will be supplied to centrally located injection wells. The injection well will be surrounded by monitoring wells.

Groundwater will be extracted from the treatment zone, blended with the treatment reagents, filtered and then injected into the treatment zone. The extracted groundwater will first be pumped into a storage tank. The water will then be blended with the treatment chemicals using a metering pump and in-line mixer. Solids will be removed in a settling tank. Water containing the treatment solution will be filtered prior to injection. A combination of field test kits and laboratory analysis will be used to confirm that the desired concentration of treatment chemical is achieved. Flexible hose will be used to connect the injection wells to the treatment solution storage tank. Flow meters will be installed for each injection well so that the performance of each well can be monitored. Solution is expected to be injected under a slight pressure (less than 40 pounds per square inch) provided by an injection pump. Each injection well will be outfitted with a float control valve or other means to more evenly distribute the flow among the injection wells. If the flow rate to an injection well decreases, the well will be redeveloped.

At this time it is anticipated that the treatment reagents will be injected in a sequential manner. First, the primary reductant (CaSx) will be injected. After review of the initial CaSx injection data, a decision regarding injection of FeS will be made. If the FeS is not being generated in-situ and the injection of FeS is expected to be beneficial, then FeS will be injected. The estimated concentration of FeS solution for injection is 100 to 500 milligrams per liter ("mg/l"). For FeS tests, beneficial results (maintenance of reducing conditions) should be observed before 0.5 pore volumes are added. Therefore, the injection volume for FeS will not exceed 0.5 pore volumes.

Submersible pumps with variable speed drives designed to maintain a constant drawdown will be installed in the extraction wells. An initial batch of approximately 20,000 gallons of water will be extracted and pumped to the storage tank. Flow rates from each extraction well will be recorded and drawdown in nearby

monitoring and injection wells recorded. This initial batch of water will be processed and stored in the treatment solution storage tank. After results from the first batch of treatment solution are obtained, injection will begin. Later, groundwater will be extracted, processed, and injected in a continuous process.

The exact injection procedure will be determined in the field based on preliminary results. Injections will likely start with a few wells and then ramp-up as the process proceeds. Push-pull tests may be conducted to help determine the exact injection process. Push-pull tests consist of injecting treatment solution at one injection well and allowing the solution to react for a period of time (typically overnight). Then the injection volume plus several (approximately 10) times more the injection volume is extracted. The extracted water is periodically tested (redox potential and hexavalent chromium) to determine effectiveness of treatment. Once the injection process is fully defined, simultaneous extraction from all extraction wells and injection in all injection wells should be possible as the process is refined. Testing during injection will include:

- Flow rates from each extraction wells (daily);
- Drawdown in extraction wells (daily);
- Flow rates and pressure in injection wells (daily);
- Groundwater elevations in monitoring wells (twice per week);
- For the CaSx injection, field testing of monitoring wells and extraction wells for presence of treatment chemicals (SO_4^{-2} , S, Ca and Na), pH and redox potential (once per week);
- For biological treatment testing will include field parameters (pH, dissolved oxygen, temperature and oxidation potential). If a tracer is used, analysis for the tracer will also be conducted; and
- Laboratory analysis for chromium (hexavalent and total, filtered and unfiltered) and other constituents (sulfate, Ca and Na) in monitoring wells will be conducted. The frequency of laboratory testing will begin as weekly and then extend to monthly as the injection process proceeds.

5.4 Treatment Solution Mixing and Injection – CaSx Treatment

The primary reductant chemicals under consideration are calcium polysulfide and/or sodium polysulfide. Products being considered for injection include:

- Calcium Polysulfide (“CaSx”) as a 29% liquid solution delivered in tankers, BSP Cascade is a supplier.
- Ferrous Sulfide (“FeS”) as a 10% liquid suspension delivered in tankers, Redox Solutions is a supplier.

5.5 Process Health and Safety Concerns

The health and safety concerns associated with the CaSx treatment process are as follows:

- Reaction/ incompatibilities of reagents {Ferric sulfide and CaSx solution} used in the treatment process;
- Proper handling of reagents used in the treatment process;
- Working around construction equipment including drill rigs;
- Temporary electrical supply; and
- Workers’ exposure to impacted soil/groundwater COPR, hexavalent chromium and off gases during drilling.

5.6 Chemical Reagents

CaSx will be delivered to the site as a 29% solution in water. CaSx is a deep reddish liquid with a strong rotten egg odor. CaSx is a highly alkaline substance with a pH between 11.0 and 12.5. CaSx can irritate the eyes and cause severe corneal damage. Skin contact will result in irritation and possible corrosion of the skin. Ingestion will irritate/burn mouth, throat and gastrointestinal tract. There is no occupational exposure level for CaSx and its ingredients, since CaSx is capable for releasing hydrogen sulfide the manufacturer use the occupational level for hydrogen sulfide. The OSHA PEL for hydrogen sulfide is 10 ppm as a TWA₈. Hydrogen sulfide gas is also flammable with a Lower Flammability Limit ("LFL") of 4.0% and upper flammability limit of 44%. CaSx is incompatible with strong oxidizers such as nitrates, nitrites or chlorates can cause explosive mixtures if heated to dryness. Acids, acidic materials or dilution with water will cause the release of hydrogen sulfide, a highly toxic gas.

While in storage CaSx must be stored in a well ventilated area away from combustible materials, sources of heat or flame and out of direct sunlight at moderate temperature (<90° F). CaSx will be stored on site in a 5,000-gallon double wall plastic tank. The tank containment must be protected from physical damage. The tank of CaSx must be properly labeled as to its content and hazards using the manufacturers' labels or an NFPA 704M label specific for the material is considered to be an acceptable label (H/2, F/0, R/1). All containers of CaSx must be labeled in accordance with OSHA's Hazard Communication Standard. The MSDS for CaSx must be readily available on site. Fitting for the transfer of the transfer of CaSx must be unique and not compatible with other fittings (i.e. water).

Ferrous sulfide is black liquid solution (10% FeS in water suspension) with a pH between 8.0 and 12 units. Ferrous sulfide can irritate the eyes, and mucous membranes. Skin contact will result in irritation and possible corrosion of the skin. Ingestion will irritate/burn mouth, throat and gastrointestinal tract. There is no occupational exposure level for ferrous sulfide. Ferrous sulfide is incompatible with strong acids, metal oxides, and strong bases decomposing into hydrogen sulfide.

Ferrous sulfide must be stored in a well ventilated area away from combustible materials, sources of heat or flame and out of direct sunlight at moderate temperature (<90° F). Ferrous sulfide will be stored on site in a 5,000-gallon double wall plastic tank. The tank containment must be protected from physical damage. The tank of ferrous sulfide must be properly labeled as to its content and hazards using the manufacturers' labels or an NFPA 704M label specific for the material is considered to be an acceptable label (H/1, F/0, R/0). All containers of ferrous sulfide must be labeled in accordance with OSHA's Hazard Communication Standard. The MSDS for ferrous sulfide must be readily available on site. The fitting for the transfer of the transfer of ferrous sulfide must be unique and not compatible with other fittings (i.e. water, CaSx).

5.7 Engineering/Work Practice Controls

Engineering controls will consist of the following:

- Proper storage and protection of chemical reagents;
- Secondary containment for liquid chemical reagents;
- Use of material compatible with the chemical reagents;
- Use of dust control agents to prevent dusting;
- Designation of an EZ, CRZ and support zone; and
- Installation of a safety drench shower/eyewash meeting ANSI standards in the area where chemicals are handled/stored.

Work practice controls will consist of the following:

- Twenty-four hour security coverage of the site;

- Fenced in site;
- Implementation of a sign-in/sign-out procedure;
- Limit the number of workers in the EZ;
- Daily inspection of process equipment and reagent storage tanks;
- Limit the number of vehicles on site to reduce the chance of collisions, and establish hand signals for workers;
- Use of direct push or sonic drilling methods to prevent the generation of dust;
- Slow equipment movement down to prevent the generation of dust;
- Daily inspection of construction equipment;
- Maintaining an upwind position;
- No eating, drinking, or applying cosmetics while in the EZ; and
- Implementation of decontamination procedures for personnel and equipment that enter the EZ.

5.8 Personal Protective Equipment

To protect workers from accidental splash or inhalation of gases, mists or vapors, chemical resistant garments and respiratory protection will be used when handling or transferring chemicals. The use of PPE is also necessary to protect workers from contaminants of concern, COPR and hexavalent chromium during well construction and sampling.

Based on the hazardous properties of the chemical reagents and contaminants of concern Level C PPE is recommended for the initial blending operation where the concentrated CaSx and FeS solutions are being used. Level C protection will consist of the following:

- Hardhat
- High visibility vest
- Steel toe protective foot wear
- Hearing protection
- Full face powered air purifying respirator (APF- 1000) equipped with combination organic vapor/acid gas cartridge with a P-100 filter. This cartridge is recommended for escape only in an atmosphere containing hydrogen sulfide.
- Chemical-resistant overalls (Tychem QC- chemical splash)
- Inner gloves: Best Safety N-DEX or equivalent
- Outer gloves: Ansell-Edmont SOL-VEX (Nitrile) or equivalent
- Over boots (rubber)

Respirator cartridges must be changed after each day's use, immediately if breakthrough is perceived, or when breathing becomes difficult. Chemical resistant coveralls and outer gloves must be properly disposed of after each use. If chemical resistant glove or coverall become ripped or show signs of swelling or failure, the person should immediately leave the area, remove the protective equipment and immediately notify the SSO of the potential exposure. It is the responsibility of each employee to inspect their PPE for defects prior to donning. Defective PPE must be replaced.

The SSO, with concurrence from the PM and RSHEM, may down grade the level of protection based on air monitoring results, observation of work practices or hazardous assessment. Handling of the dilute solutions after blending will likely be a Level D operation. Down grading of PPE may occur if the use PPE poses a safety hazard (i.e. heat stress, entanglement).

Modified Level D protection is recommended for activities where respirator protection is not required and maybe limited to handling of reagents when splash is anticipated. Level D modified protection will consist of the following:

- Chemical-resistant overalls (Tychem QC- chemical splash) or neoprene apron
- Inner gloves: Best Safety N-DEX or equivalent
- Outer gloves: Ansell-Edmont SOL-VEX (Nitrile) or equivalent
- Over boots (rubber)
- Safety glasses
- Full face splash shield worn over safety glasses

Level D protection is recommended for activities where respirator and dermal protection is not required. Level D modified protection will consist of the following:

- Hardhat
- High visibility vest
- Steel toe protective foot wear
- Safety glasses
- Shirt with sleeves
- Long pants

5.9 Air Monitoring

5.9.1 Dust/Hexavalent Chromium during Drilling

The TSI DustTrak and DataRAM Model DR 1000 Aerosol Monitors (or equivalent) measures concentrations of airborne dust, smoke, mists, haze and fumes with real-time readout. The instrument can be used for exposure sampling of ambient air, during intrusive work. TSI DustTrak Aerosol Monitors will be to measure the upwind and downwind concentrations of particulates at the perimeter of the EZ, while personal aerosol monitors (such as the DataRAM DR 1000 or equivalent) will be used to monitor worker exposure within the EZ.

A personal exposure level was calculated base on contaminants of concern hexavalent chromium which has the lowest occupational exposure ($0.005 \text{ mg/m}^3 \text{ TWA}_8$) of the potential dust producing substances such as Portland cement and ferrous sulfide. It is recognized that respirable dust particles are generally not visible to the naked eye, but a total airborne dust clouds is often visible at concentrations of 2 mg/m^3 . Since visible dust is not acceptable a dust action of 0.167 mg/m^3 will be used as the dust action level for upgrading to Level C. Regardless of the measured airborne concentration of dust in the workers breathing zone the initial level of protection will be Level C as described in **Section 5.8**.

5.9.2 Hydrogen Sulfide

The soil treatment may generate hydrogen sulfide under acidic conditions. Hydrogen sulfide will be measured using a single gas monitor such as the BW Tech Gas Alert or equivalent specifically for hydrogen sulfide. Measurement for hydrogen sulfide will be made on an intermittent basis inside and outside the EZ and outside the during the treatability study.

If any hand-held hydrogen sulfide instantaneous levels exceed 5 ppm for a sustained 15 minute period, workers should relocate to an area were the airborne concentration of hydrogen sulfide is less than 5 ppm. Regardless of the measured airborne concentration of hydrogen sulfide in the workers breathing zone the initial level of protection will be Level C as described in **Section 5.8**. As noted in **Section 5.8**, the respirator cartridge is recommended and approved for escape only in an atmosphere containing hydrogen sulfide.

5.9.3 Volatile Organic Vapors

During well installation, the air in work areas will be monitored periodically for the potential presence of volatile organic vapors. A portable PID with a 10.6 eV lamp will be utilized to periodically monitor the levels of volatile organic compound in the ambient air. Measurements will be monitored from the breathing zone (4 to 5 feet above ground level) at worker locations to determine working conditions and whether there is a need to change levels of worker protection.

If the PID indicates sustained (15 minute) breathing zone vapor concentrations in excess of 5 ppm above background Level C respiratory protection should be donned. Regardless of the measured airborne concentration of VOC in the workers breathing zone the initial level of protection will be Level C as described above.

5.9.4 Calibration

The Aerosol Monitors will be field checked daily using zero calibration air. At the beginning of each workday (prior to site intrusive activities each day) a calibration zero check will be performed on each unit at the measurement locations. A zero (or particulate-free) test sample, using the appropriate particulate filter supplied by the manufacturer for this purpose, will be placed over the sample inlet. The data output for the monitor will be observed and the response recorded in a field logbook.

Prior to each measurement session, an on-site dynamic calibration of the hydrogen sulfide monitor will be performed against a known hydrogen sulfide calibration gas. The daily calibration will also include a dynamic zero air check of the instrument. The data output for the monitor will be observed and the response recorded in a field logbook.

At the beginning of each workday (prior to site intrusive activities each day) the PID will be bump tested in as a means of verifying calibration by using a known concentration of test gas (isobutylene). In addition the PID will be zeroed using a zero gas or filter unit as specified by the instruments manufacturer. The data output for the monitor will be observed and the response recorded in a field logbook.

5.9.5 Personal Air Sampling

Personal exposure assessment will be conducted for organic vapors/benzene and hexavalent chromium/total dust if the dust action level is exceeded during the task or if the task is determined to be "high-risk" for personal exposure. Personal air samples will be collect in accordance with OSHA and/or NIOSH methodology and analyzed by an AIHA accredited laboratory. The results of the sampling will be communicated to project personnel. The number of workers selected to wear the personal sampling pumps will be determined in advance of the field activity by AECOM's RSHEM.

5.9.6 Analytical Methods

- Hexavalent Chromium- 29 CFR 1910.1026(d)-Analytical Method OSHA ID-215
- Dust-NIOSH Analytical Method- 0500
- Benzene- 29 CFR 1910.1028 (e) - Analytical Method 12 or equivalent.

5.9.7 Task-Specific Job Safety Analysis

Specific JSA's/THAs will be prepared for the following:

- Chemical handling/blending
- Drilling/well construction
- Injection and Extraction Equipment operation
- Soil/groundwater sampling

6.0 Treatment Solution Mixing and Injection – Biological Treatment

The second remedial technology proposed for shallow and intermediate zone pilot testing is anaerobic bioprecipitation and hexavalent chromium fixation. This process incorporates the periodic delivery of a degradable organic carbon source to stimulate the native microorganisms and promote the development of an in situ reaction zone ("IRZ"). The goal of this process is to overcome the aquifer's supply of aerobic electron acceptors (primarily oxygen and nitrate) and to stimulate iron and sulfate reducing conditions. In this environment, microorganisms can support the reduction of hexavalent chromium by a variety of mechanisms. While these processes include enzymatic extracellular reduction and intracellular reduction (Zhu et al, 2008), the primary mechanisms are via the reduction of naturally-occurring iron and sulfate (by microbial respiration) to create ferrous iron (Fe(II)) and sulfides (H_2S , HS^-) that react abiotically with hexavalent chromium. These reactions reduce hexavalent chromium to trivalent chromium and result in the formation of trivalent chromium-hydroxide solids.

This remedial process is designed to reductively precipitate and permanently fix/immobilize the chromium in the aquifer, thereby removing chromium from the groundwater.

The goal of the proposed IRZ application is to demonstrate proof of concept for the anaerobic bioprecipitation approach. The initial demonstration of biologically-mediated chromium reduction will be accomplished by conducting an initial injection of a carbohydrate solution to enhance reducing conditions in the subsurface and promote development of the IRZ. Monitoring activities during and following the injection will be used to evaluate the overall changes in dissolved metals concentrations and the biogeochemistry within the injection area over time. Additional injection events will be conducted, as necessary, based on results observed during the operational monitoring period.

As organic carbon is the driver for the entire treatment process, the single most critical factor in the successful application of anaerobic IRZ technology is adequate delivery and distribution of the carbon source in the subsurface to achieve contact with the impacted soil and groundwater targeted for treatment. This requires an adequate understanding of the hydrogeologic environment, plume configuration, and the specific responses to fluid injection as a function of geology. Thus, the overall objectives of this approach are as follow:

- Collect site-specific data from hydraulic injection/tracer testing to support the engineering design of the full-scale injection program;
- Establish a geochemical environment conducive to hexavalent chromium bioprecipitation (i.e. iron-to sulfate-reducing);
- Demonstrate hexavalent chromium mass reduction by evaluating dissolved metal concentrations and water quality data within the treatment areas; and
- Determine of the optimal injection frequency and substrate loading for full-scale operations.

As proposed, the carbon delivery approach does not include groundwater re-circulation to promote subsurface distribution, but relies instead on batch injection to achieve sufficient subsurface distribution during the initial injection event. As multiple lithologies are being targeted in this pilot test (shallow backfill materials within the IIR#1 excavation area and the underlying intermediate sand, silt and gravel lithologies), the batch injection method will be used to evaluate aquifer hydraulics in these intervals and to determine whether subsurface heterogeneities could potentially limit distribution during full-scale application. Enhanced hydraulic distribution mechanisms (i.e. recirculation) can be easily coupled with this remedial strategy, but are not necessary to demonstrate overall efficacy during the pilot treatment phase.

A carbon substrate (molasses) will be mixed in two 500-gallon high-density polyethylene ("HDPE") storage tanks. While one tank is being injected, the second tank will be filled with the subsequent batch such that

the injections can be executed continuously. Conveyance tubing will be used to deliver the carbon solution through a manifold network to each of the injection well heads. During the injection event, injection flow rates and wellhead pressures will be recorded using digital turbine flow-meters and pressure gauges within the manifold.

During the initial organic carbon injection, two different solutions will be mixed to provide greater data resolution following the injection event. One solution will include molasses and inert Rhodamine WT dye, and the other solution will include molasses alone. As both Total Organic Carbon ("TOC") and dye analyses will be collected following the injection, the concentration profiles of these two constituents will be used to refine the groundwater flow direction and velocity, and to assess the rate of organic carbon utilization.

6.1 Process Health and Safety Concerns

The health and safety concerns associated with the biological treatment process are as follows:

- Working around construction equipment including drill rigs;
- Temporary electrical supply; and
- Workers' exposure to impacted soil/groundwater (Chromite Ore Processing Residue), hexavalent chromium and off gases.

6.2 Process Chemical

The carbon source, molasses poses no unique physical or health hazards to site personnel. The carbon source requires no special precautions.

Rhodamine WT dye is a red liquid with no odor. Rhodamine WT dye, component is trimellitic acid (2.6%) and water. There is no occupational exposure level for Rhodamine WT dye and its components. Rhodamine WT dye is irritating to the eyes and skin. Inhalation of Rhodamine WT dye mist may cause irritation to the respiratory tract. The dye can stain clothing and skin. The product should be stored in its original water-proof container, away from direct sunlight and heat.

Engineering/Work Practice Controls

Engineering controls will consist of the following:

- Proper storage process chemicals;
- Use of material compatible with the chemical reagents;
- Use of dust control agents to prevent dusting;
- Designation of an EZ, CRZ and support zone; and
- Installation of a safety drench shower/eyewash meeting ANSI standards in the area where chemicals are handled/stored.

Work practice controls will consist of the following:

- Twenty-four hour security coverage of the site;
- Fenced in site;
- Implementation of a sign-in/sign-out procedure;
- Limit the number of workers in the EZ;
- Daily inspection of process equipment and reagent storage tanks;

- Limit the number of vehicles on site;
- Use of direct push or sonic drilling methods to prevent the generation of dust;
- Slow equipment movement down to prevent the generation of dust;
- Daily inspection of construction equipment;
- Maintaining an upwind position;
- No eating, drinking, or applying cosmetics while in the EZ; and
- Implementation of decontamination procedures for personnel and equipment that enter the EZ.

6.3 Personal Protective Equipment

The personnel protective equipment recommended for the biological treatment including installation of groundwater wells is modified Level D.

Modified Level D protection is recommended for activities where respirator protection is not required and maybe limited to handling of reagents when splash is anticipated. Level D modified protection will consist of the following:

- Chemical-resistant overalls (Tychem QC- chemical splash) or neoprene apron
- Inner gloves: Best Safety N-DEX or equivalent
- Outer gloves: Ansell-Edmont SOL-VEX (Nitrile) or equivalent
- Over boots (rubber)
- Safety glasses
- Full face splash shield worn over safety glasses.

Level D protection is recommended for activities where respirator and dermal protection is not required. Level D modified protection will consist of the following:

- Hardhat
- High visibility vest
- Steel toe protective foot wear
- Safety glasses
- Shirt with sleeves
- Long pants

The contingency to Level D and modified Level D will be Level C protection. Level C will be based on the airborne concentration of contaminants of concern, COPR and hexavalent chromium during well construction and sampling.

Based on the airborne concentrations of the contaminants of concern Level C PPE is recommended for work inside the EZ. Level C protection will consist of the following:

- Hardhat
- High visibility vest
- Steel toe protective foot wear
- Hearing protection
- Full face powered air purifying respirator (APF- 1000) equipped with combination organic vapor/acid gas cartridge with a P-100 filter. This cartridge is recommended for escape only in an atmosphere containing hydrogen sulfide.

- Chemical-resistant overalls (Tychem QC- chemical splash)
- Inner gloves: Best Safety N-DEX or equivalent
- Outer gloves: Ansell-Edmont SOL-VEX (Nitrile) or equivalent
- Over boots (rubber)

Respirator cartridges must be changed after each day's use, immediately if breakthrough is perceived, or when breathing becomes difficult. Chemical resistant coveralls and outer gloves must be properly disposed of after each use. If chemical resistant glove or coverall become ripped or show signs of swelling or failure, the person should immediately leave the area, remove the protective equipment and immediately notify the SSO of the potential exposure. It is the responsibility of each employee to inspect their PPE for defects prior to donning. Defective PPE must be replaced.

The SSO, with concurrence from the PM and RSHEM, may down grade the level of protection based on air monitoring results, observation of work practices or hazardous assessment. Down grading of PPE may occur if the use PPE poses a safety hazard (i.e. heat stress, entanglement).

6.4 Air Monitoring

6.4.1 Dust/Hexavalent Chromium

The TSI DustTrak and DataRAM Model DR 1000 Aerosol Monitors (or equivalent) measures concentrations of airborne dust, smoke, mists, haze and fumes with real-time readout. The instrument can be used for exposure sampling of ambient air, during intrusive work. TSI DustTrak Aerosol Monitors will be to measure the upwind and downwind concentrations of particulates at the perimeter of the EZ, while personal aerosol monitors (such as the DataRAM DR 1000 or equivalent) will be used to monitor worker exposure within the EZ.

A personal exposure level was calculated base on contaminants of concern hexavalent chromium which has the lowest occupational exposure ($0.005 \text{ mg/m}^3 \text{ TWA}_8$) of the potential dust producing substances such as Portland cement and ferrous sulfide.

It is recognized that respirable dust particles are generally not visible to the naked eye, but a total airborne dust clouds is often visible at concentrations of 2 mg/m^3 . Since visible dust is not acceptable a dust action of 0.167 mg/m^3 will be used as the dust action level for upgrading to Level C. Regardless of the measured airborne concentration of dust in the workers breathing zone the initial level of protection will be Level C.

6.4.2 Volatile Organic Vapors

During well installation, the air in work areas will be monitored periodically for the potential presence of volatile organic vapors. A portable PID with a 10.6 eV lamp will be utilized to periodically monitor the levels of volatile organic compound in the ambient air. Measurements will be monitored from the breathing zone (4 to 5 feet above ground level) at worker locations to determine working conditions and whether there is a need to change levels of worker protection.

3.0 If the PID indicates sustained (15 minute) breathing zone vapor concentrations in excess of 5 ppm above background Level C respiratory protection as described above should be donned. Regardless of the measured airborne concentration of VOC in the workers breathing zone the initial level of protection will be Level C as described in **Section 6.3**.

6.4.3 Calibration

The Aerosol Monitors will be field checked daily using zero calibration air. At the beginning of each workday (prior to site intrusive activities each day) a calibration zero check will be performed on each unit at the measurement locations. A zero (or particulate-free) test sample, using the appropriate particulate filter supplied by the manufacturer for this purpose, will be placed over the sample inlet. The data output for the monitor will be observed and the response recorded in a field logbook.

At the beginning of each workday (prior to site intrusive activities each day) the PID will be bump tested in as a means of verifying calibration by using a known concentration of test gas (isobutylene). In addition the PID will be zeroed using a zero gas or filter unit as specified by the instruments manufacturer. The data output for the monitor will be observed and the response recorded in a field logbook.

6.4.4 Personal Air Sampling

Personal exposure assessment may be conducted for organic vapors/benzene and hexavalent chromium/total dust if the dust action level is exceeded during the task or if the task is determined to be "high-risk" for personal exposure. Personal air samples will be collect in accordance with OSHA and/or NIOSH methodology and analyzed by an AIHA accredited laboratory. The results of the sampling will be communicated to project personnel. The number of workers selected to wear the personal sampling pumps will be determined in advance of the field activity by AECOM's RSHEM.

6.4.5 Analytical Methods

Analytical methods will include the following:

- Hexavalent Chromium- 29 CFR 1910.1026(d)-Analytical Method OSHA ID-215
- Dust-NIOSH Analytical Method- 0500
- Benzene- 29 CFR 1910.1028 (e) - Analytical Method 12 or equivalent.

6.4.6 Task-Specific Job Safety Analysis

Specific THA's will be prepared for the following:

- Chemical handling/blending
- Drilling/well construction
- Equipment operation
- Soil/groundwater sampling
