MEMORANDUM

To: **Crystal Leavey, LSRP**
From: **Marshall E. King, P.E., LSRP**
Project: **PPG, Site 63, 1 Burma Road, Jersey City, NJ**
Subject: **Compliance Averaging Analysis**
Report Date: **May 9, 2017**

Pre-post excavation soil samples (from the 2013 design boring investigation) and post-excavation soil samples (including base and sidewall samples from the remedial action between 2014 and 2016) at Site 63 were collected that served as the post-remedial samples used to document the effectiveness and completeness of the soil remediation. These samples were collected at a frequency of at least one sample per 900 square feet (sf) of excavation bottom and/or one sample per every 30 linear feet (LF) of excavation sidewall and were evaluated for compliance with applicable soil remediation standards. Elevated detected concentrations and elevated reporting limits for antimony and thallium were reported in laboratory analytical results. In order to demonstrate compliance at the site with the soil remediation standards (SRS) and impact-to-groundwater soil screening levels (IGW SSL), these post-excavation results were evaluated using a compliance averaging analysis, specifically the "75 Percent / 10x Procedure."

Delineation

Based on the extensive data set of post-remedial sample locations (including both pre-post-excavation and post-excavation samples) combined with visual observations during excavation, the aerial extent of the onsite chromate chemical production waste (CCPW) impacted fill has been horizontally and vertically delineated. As the 2013 design boring program was implemented to obtain pre-post-excavation samples to demonstrate vertical delineation of CCPW-impacted fill, CB&I believes that it is technically appropriate to apply compliance averaging techniques to these vertical delineation sample results that are located within the delineated horizontal boundaries of the impacted area. The addition of fringe side-wall and base post-excavation samples from the perimeter of the excavation complete the horizontal delineation of the site.

Remedial Volume

The area for this analysis covers the remedial extents of the completed excavation which constitutes one continuous area of concern (AOC) and that covers ±2.82-acres. As per Appendix A4.0 of the *NJDEP Technical Guidance for the Attainment of Remediation Standards and Site-Specific Criteria* (Version 1.0, September 2012), a minimum of 12 samples are required per 3,000 cy of material excavated/remediated. A total of 35,309 tons of material was excavated from the site. Assuming a density of 1.5 tons per cubic yard (cy) of material, this equates to approximately 23,500 cy of material. Therefore, a minimum of 188 post-remedial samples are required to apply the method. The following post-remedial sample location counts were collected during each phase of investigation at the site:

- 192 base and sidewall sample locations during remedial action (RA) from 2014-2015;
- 5 sample locations during the post-RA in 2016;

- 27 base and sidewall sample locations during the post-RA Supplemental Remedial Investigation in 2016;
- 58 pre-post-excavation locations during the design borings program in 2013;
- 60 pre-post excavation sample locations during the Remedial Investigation from 2011-2012;
- 13 sample locations during the Site Investigation in 2011; and
- 5 sample locations during after the Remedial Action that was performed from 1998-1999.

This is a total of 360 sample locations to define the limits of the excavation. Note that in some cases, multiple samples were collected at various depths at each location, but for the purposes of this analysis we are only considering the single uppermost sample per location as a compliance point. The vertical zone of CCPW-impacted materials ranged from 0 to 10.3 feet below ground surface (ft bgs), and all samples used for this analysis were present within this single zone.

Excluded Samples

The following detections for antimony were excluded from this analysis:

- o 063_C013A
  - 0 to 0.5 ft bgs (10.0 mg/kg)
  - 0.5 to 1 ft bgs (18.8 mg/kg)
  - 1.5 to 2 ft bgs (9.8 mg/kg)
  - 2.5 to 3 ft bgs (11.1 mg/kg)
  - 3.5 to 4 ft bgs (12.4 mg/kg)

There are multiple lines of evidence that indicate the antimony results in sample 063_C013A are not related to the CCPW that was identified on Site 63, but are instead related to the presence of non-CCPW fill material on the New Jersey Turnpike Authority property located to the northeast of Site 63. Antimony concentrations in soil were found to be in compliance at the site boundary of Site 63 in all samples collected in this area. In addition, CCPW was not identified in the soil at this boring location. Furthermore, antimony concentrations were not found to be within the range identified in sample 063_C013A on Site 63, even in locations where CCPW was positively identified. It can therefore be concluded that the antimony results in sample 063_C013A are not indicative of PPG-related contamination.

Remediation Standards and Criteria

The following table summarizes the applicable soil remediation standards and soil screening levels used in this compliance averaging analysis.

	NJ Non-Residential Direct Contact Soil (NJAC 7:26D 5/12)	NJ Residential Direct Contact Soil (NJAC 7:26D 5/12)	NJ Default Impact-to-Groundwater Soil Screening Level (11/2013)
Antimony (mg/kg)	450	31	6
Thallium (mg/kg)	79	5	3

Antimony (Sb)

For Antimony, either sample results were reported to be above the NJDEP SRS or elevated reporting limits (RLs) were documented. These samples were:

- BR003, 8.1 to 8.6 ft bgs (<6.8 NJ- mg/kg)
- PPG 63/65_B43R, -0.8 to -1.3 ft el (<6.9 NJ- mg/kg)
- BD008, 6 to 6.5 ft bgs (<11 NJ- mg/kg)
- BD010, 6 to 6.5 ft bgs (93.4 mg/kg)
- SWR009, 1.0 to 1.5 ft bgs (30.3 NJ-)

These five sample locations constitute 1.4% of the post-remedial sample locations at the site, therefore 98.6% of the post-remedial sample locations are either non-detect or exhibit antimony concentrations less than the soil remediation standards (SRS) and/or impact-to-groundwater soil screening level (IGW SSL). This is above the 75% threshold for this analysis.

The exceedance of the IGW SSL for antimony in soil sample BD010 is located within the saturated zone and the IGW SSL does not apply. All remaining reporting limits and detections for antimony are less than 10 times the most stringent standard (IGW SSL) of 6 mg/kg (i.e., less than 60 mg/kg).

The detection in soil sample BD010 is in excess of the Residential SRS; however the result is less than 10 times the applicable residential soil remediation standard of 31 mg/kg (i.e., less than 310 mg/kg).

Thallium (Tl)

For Thallium, the reporting limits (RLs) for four non-detect samples were reported to be above the NJDEP RDC Standard. These samples were:

- 065_A005, 5 to 5.5 ft bgs (<6.3 U mg/kg)
- 065_A006, 8.2 to 8.7 ft bgs (<5.6 U mg/kg)
- BD008, 6 to 6.5 ft bgs (<5.7 mg/kg)
- PPG 63/65_B29, 7.8 to 8.3 ft bgs (<6.3 mg/kg)

These reporting limits for thallium are less than 10 times the RDC Standard of 5 mg/kg (i.e., less than 50 mg/kg).

For Thallium, the RL for one non-detect sample was reported to be above the NJDEP Default IGW SSL. This sample was:

- PPG 63/65-SW33, 1.5 to 2 ft bgs (<3.1 mg/kg)

These five sample locations constitute 1.4% of the post-remedial sample locations at the site, therefore 98.6% of the post-remedial sample locations are either non-detect or in compliance below applicable standards and criteria. This is above the 75% threshold for this analysis. All reporting limits for thallium are less than 10 times the IGW SSL of 3 mg/kg (i.e., less than 30 mg/kg).

Conclusions

For antimony and thallium, greater than 75% of the post-remedial sample results were either non-detect or in compliance with the standards and criteria, and all reporting limits and contaminant detections were less than 10 times the applicable remediation standard or criteria. Based on these findings, the remediation of these contaminants in soil is deemed complete.

Elevation:	-2.9 - (-2.4)	-3.4 - (-2.9)	-3.9 - (-3.4)
Cr6+ (1)	37.2	-	-
Cr6+ (2)	1.6	-	-
Cr6+ (3)	<1.3	-	-

False positives (i.e., errant exceedances) for Cr6+ were reported for SB5, SB11, and SB13. The original Cr6+ results were suspect due to Cr6+ concentrations reported greater than Cr3+. The laboratory re-homogenized the soil samples and collected new aliquots that were processed and analyzed both by EPA Method 7196A (1) and (2) and EPA Method 7199 (3) for confirmation of the Cr6+ concentrations. Cr3+ was also re-analyzed to confirm the reported concentrations. Re-analysis of the samples confirmed Cr6+ is not present above the applicable criteria at these locations.

False positives (i.e., errant exceedances) for Cr6+ were reported for SB5, SB11, and SB13. The original Cr6+ results were suspect due to Cr6+ concentrations reported greater than Cr3+. The laboratory re-homogenized the soil samples and collected new aliquots that were processed and analyzed both by EPA Method 7196A (1) and (2) and EPA Method 7199 (3) for confirmation of the Cr6+ concentrations. Cr3+ was also re-analyzed to confirm the reported concentrations. Re-analysis of the samples confirmed Cr6+ is not present above the applicable criteria at these locations.

FOOTNOTES:

1. All analytical results are reported in mg/kg (milligrams per kilogram).
2. PPG63/65_CCS01,PPG63/65CC_S02,PPG63/65_CCS023, PPG63/65_CCG4 AND PPG63/65_CCSMP are concrete samples.
3. ^– Sample compliance averaged to below standard/criteria.
4. Soil boring locations by CB&I using GPS.
5. msl–mean sea level.
6. bgs–below ground surface.
7. **Result exceeded**

NRDCSRS - Non-Residential Direct Contact Soil Remediation Standard (N.J.A.C. 7:26D, 5/12)
RDCSRS - Residential Direct Contact Soil Remediation Standard (N.J.A.C. 7:26D, 5/12)
IGWSSL - Default Impact to Groundwater Soil Screening Level (N.J.A.C. 7:26D, 11/13)
- = No standard/criteria established for this analyte.
** = Site-Specific Calculation using NJDEP Synthetic Precipitation Leaching Procedure (SPLP) Guidance (November 2013).

ANALYTICAL DATA QUALIFIERS:

J - The reported result is an estimated value;
*J - Duplicate analysis not within control limits; result is estimated with indeterminate bias direction.
EJ - The reported value is estimated because of the presence of interference; indeterminate bias direction.
N - The matrix spike sample recovery in the associated QC sample is not within QC limits.
J+ -The result is estimated and may be biased high.
J- -The result is estimated and may be biased low.
R - The reported result is rejected.

NOTES AND REFERENCES:

NRDCSRS - Non-Residential Direct Contact Soil Remediation Standard (N.J.A.C. 7:26D, 5/12)
RDCSRS - Residential Direct Contact Soil Remediation Standard (N.J.A.C. 7:26D, 5/12)
IGWSSL - Default Impact to Groundwater Soil Screening Level (N.J.A.C. 7:26D, 11/13)
- = No standard/criteria established for this analyte.
** = Site-Specific calculation using NJDEP Synthetic Precipitation Leaching Procedure (SPLP) Guidance (November 2013).

ANALYTICAL DATA QUALIFIERS:

< The analyte was analyzed for, but was not detected above the stated reporting limit.

* Duplicate analysis not within control limits; indeterminate bias direction.

J The reported result is an estimated value.

NJ The matrix spike sample recoveries in the associated QC sample are outside QC limits; the result is an estimated value with no definitive bias.

NJ- The matrix spike sample recoveries in the associated QC sample are below QC limits; the result is an estimated value with a potential low bias.

Analytical Data Qualifiers:
< - The analyte was not detected at the stated reporting limit.
***** - Duplicate analysis not within control limits; indeterminate bias direction.
J - The reported result is an estimated value.
***J** - Duplicate analysis not within control limits; result is estimated with indeterminate bias direction.
EJ - The reported value is estimated because of the presence of interference; indeterminate bias direction.

N -The matrix spike sample recovery in the associated QC sample is not within QC limits.
J+ - The result is estimated and may be biased high.
J- -The result is estimated and may be biased low.
R - The reported result is rejected.
Notes:
**-Nickel site specific impact due to groundwater screen level method
calculated using SPLP laboratory methods; SPLP = Synthetic Precipitation Leaching Procedure.
[a] - Analytical result in this location was not considered an exceedance because analyte of concern was compliance averaged below soil remediation standard.

[b] - The ferrous iron test was analyzed after completion of Cr6 testing (outside of normal hold times for this parameter) in order to provide more information about the possible impact of the sample matrix on Cr6 recoveries.

[c] - Multiple injections indicate possible sample non-homogeneity.

[d] - The sulfide screen test was analyzed after completion of Cr6 testing (outside of normal hold times for this parameter) in order to provide more information about the possible impact of the sample matrix on Cr6 recoveries.

= Sample deemed usable due to acceptable insoluble recovery and secondary analytics.
ft msl = feet mean sea level
ft bgs = feet below ground surface
mg/kg = milligram per kilogram
su = standard unit
mv = millivolts
Result exceeded criteria

Sample included in compliance averaging analysis.

Analytical Data Qualifiers:

< - The analyte was not detected at the stated reporting limit.

***** - Duplicate analysis not within control limits; indeterminate bias direction.

J - The reported result is an estimated value.

***J** - Duplicate analysis not within control limits; result is estimated with indeterminate bias direction.

EJ - The reported value is estimated because of the presence of interference; indeterminate bias direction.

N -The matrix spike sample recovery in the associated QC sample is not within QC limits.

J+ - The result is estimated and may be biased high.

J- -The result is estimated and may be biased low.

R - The reported result is rejected.

Notes:

**-Nickel site specific impact due to groundwater screen level method

calculated using SPLP laboratory methods; SPLP = Synthetic Precipitation Leaching Procedure.

[a] - Analytical result in this location was not considered an exceedance because analyte of concern was compliance averaged below soil remediation standard.

[b] - The ferrous iron test was analyzed after completion of Cr6 testing (outside of normal hold times for this parameter) in order to provide more information about the possible impact of the sample matrix on Cr6 recoveries.

[c] - Multiple injections indicate possible sample non-homogeneity.

[d] - The sulfide screen test was analyzed after completion of Cr6 testing (outside of normal hold times for this parameter) in order to provide more information about the possible impact of the sample matrix on Cr6 recoveries.

= Sample deemed usable due to acceptable insoluble recovery and secondary analytics.

ft msl = feet mean sea level

ft bgs = feet below ground surface

mg/kg = milligram per kilogram

su = standard unit

mv = millivolts

Analytical Data Qualifiers:

< - The analyte was not detected at the stated reporting limit.

***** - Duplicate analysis not within control limits; indeterminate bias direction.

J - The reported result is an estimated value.

***J** - Duplicate analysis not within control limits; result is estimated with indeterminate bias direction.

EJ - The reported value is estimated because of the presence of interference; indeterminate bias direction.

N -The matrix spike sample recovery in the associated QC sample is not within QC limits.

J+ - The result is estimated and may be biased high.

J- -The result is estimated and may be biased low.

R - The reported result is rejected.

Notes:

**-Nickel site specific impact due to groundwater screen level method

calculated using SPLP laboratory methods; SPLP = Synthetic Precipitation Leaching Procedure.

[a] - Analytical result in this location was not considered an exceedance because analyte of concern was compliance averaged below soil remediation standard.

[b] - The ferrous iron test was analyzed after completion of Cr6 testing (outside of normal hold times for this parameter) in order to provide more information about the possible impact of the sample matrix on Cr6 recoveries.

[c] - Multiple injections indicate possible sample non-homogeneity.

[d] - The sulfide screen test was analyzed after completion of Cr6 testing (outside of normal hold times for this parameter) in order to provide more information about the possible impact of the sample matrix on Cr6 recoveries.

= Sample deemed usable due to acceptable insoluble recovery and secondary analytics.

ft msl = feet mean sea level

ft bgs = feet below ground surface

mg/kg = milligram per kilogram

su = standard unit

mv = millivolts

J - The reported result is an estimated value.

EJ - The reported value is estimated because of the presence of interference; indeterminate bias direction.

N -The matrix spike sample recovery in the associated QC sample is not within QC limits.

J+ - The result is estimated and may be biased high.

J- - The result is estimated and may be biased low.

R - The reported result is rejected .

Notes:

**- Nickel site specific impact due to groundwater screen level method calculated using SPLP laboratory methods; SPLP = Synthetic Precipitation Leaching Procedure.

[a] - Analytical result in this location was not considered an exceedance because analyte of concern was compliance averaged below soil remediation standard.

ft msl = feet mean sea level

ft bgs = feet below ground surface

mg/kg = milligram per kilogram

su = standard unit

mv = millivolts

Analytical Data Qualifiers:

< - The analyte was not detected at the stated reporting limit.

***** - Duplicate analysis not within control limits; indeterminate bias direction.

J - The reported result is an estimated value.

***J** - Duplicate analysis not within control limits; result is estimated with

EJ - The reported value is estimated because of the presence of interference;

N -The matrix spike sample recovery in the associated QC sample is not within

J+ - The result is estimated and may be biased high.

J- - The result is estimated and may be biased low.

Notes:

**- Nickel site specific impact due to groundwater screen level method

calculated using SPLP laboratory methods; SPLP = Synthetic Precipitation Leaching Procedure.

ft msl = feet mean sea level

ft bgs = feet below ground surface

mg/kg = milligram per kilogram

su = standard unit

mv = millivolts

Analytical Data Qualifiers:

< - The analyte was not detected at the stated reporting limit.

***** - Duplicate analysis not within control limits; indeterminate bias direction.

J - The reported result is an estimated value.

***J** - Duplicate analysis not within control limits; result is estimated with indeterminate bias direction.

EJ - The reported value is estimated because of the presence of interference; indeterminate bias direction.

N -The matrix spike sample recovery in the associated QC sample is not within QC limits.

J+ - The result is estimated and may be biased high.

J- The result is estimated and may be biased low.

R - The reported result is rejected .

Notes:

CCPW = Chromate Chemical Production Waste

ft msl = feet mean sea level

ft bgs = feet below ground surface

mg/kg = milligram per kilogram

mV = millivolts

[a] Elevated detection limit due to dilution required for high interfering element.

[+] Hex Chrome Sample did not pass 2nd QA & QC. See Table 2D-2 for secondary analyses.

**Site-specific impact to groundwater criteria developed using SPLP methodology for Nickel; SPLP = Synthetic Precipitation Leaching Procedure.

***Located below water table so IGW SSL does not apply, and compliance averaged to below standards/criteria.

Result exceeded criteria

Analytical Data Qualifiers:

< - The analyte was not detected at the stated reporting limit.

***** - Duplicate analysis not within control limits; indeterminate bias direction.

J - The reported result is an estimated value.

***J** - Duplicate analysis not within control limits; result is estimated with indeterminate bias direction.

EJ - The reported value is estimated because of the presence of interference; indeterminate bias direction.

N -The matrix spike sample recovery in the associated QC sample is not within QC limits.

J+ - The result is estimated and may be biased high.

J- The result is estimated and may be biased low.

R - The reported result is rejected .

Notes:

CCPW = Chromate Chemical Production Waste

ft msl = feet mean sea level

ft bgs = feet below ground surface

mg/kg = milligram per kilogram

mV = millivolts

[a] Elevated detection limit due to dilution required for high interfering element.

[+] Hex Chrome Sample did not pass 2nd QA & QC. See Table 2D-2 for secondary analyses.

**Site-specific impact to groundwater criteria developed using SPLP methodology for Nickel; SPLP = Synthetic Precipitation Leaching Procedure.

***Located below water table so IGW SSL does not apply, and compliance averaged to below standards/criteria.

Result exceeded criteria

Analytical Data Qualifiers:

< - The analyte was not detected at the stated reporting limit.

***** - Duplicate analysis not within control limits; indeterminate bias direction.

J - The reported result is an estimated value.

***J** - Duplicate analysis not within control limits; result is estimated with indeterminate bias direction.

EJ - The reported value is estimated because of the presence of interference; indeterminate bias direction.

N -The matrix spike sample recovery in the associated QC sample is not within QC limits.

J+ - The result is estimated and may be biased high.

J- The result is estimated and may be biased low.

R - The reported result is rejected .

Notes:

CCPW = Chromate Chemical Production Waste

ft msl = feet mean sea level

ft bgs = feet below ground surface

mg/kg = milligram per kilogram

mV = millivolts

[a] Elevated detection limit due to dilution required for high interfering element.

[+] Hex Chrome Sample did not pass 2nd QA & QC. See Table 2D-2 for secondary analyses.

**Site-specific impact to groundwater criteria developed using SPLP methodology for Nickel; SPLP = Synthetic Precipitation Leaching Procedure.

***Located below water table so IGW SSL does not apply, and compliance averaged to below standards/criteria.

Result exceeded criteria

Analytical Data Qualifiers:
< - The analyte was not detected at the stated reporting limit.
* - Duplicate analysis not within control limits; indeterminate bias direction.

N -The matrix spike sample recovery in the associated QC sample is not within QC limits.
R - The reported result is rejected.
J- The result is estimated and may be biased low.

Footnotes:
[C] 7196A sample methodology
[D] 7199 sample methodology (Sample was homogenized before being run)
[E] False positives (i.e., errant exceedances) for Cr6+ were reported for SB5, SB11, and SB13. The original Cr6+ results were suspect due to Cr6+ concentrations reported greater than total chrome. The laboratory re-homogenized the soil samples and collected new aliquots that were processed and analyzed both by EPA Method 7196A and EPA Method 7199 for confirmation of the Cr6+ concentrations. Total chrome was also re-analyzed to confirm the reported concentrations. Re-analysis of the samples confirmed Cr6+ is not present above the applicable criteria at these locations.

[1] NOTE: Soil Remediation Standards from June 2008 were incorporated in the May 2012 rule without change.
ft bgs = feet below ground surface

Analytical Data Qualifiers:

< The analyte was analyzed for, but was not detected above the stated reporting limit.

* Duplicate analysis not within control limits; indeterminate bias direction.

J The reported result is an estimated value.

NJ The matrix spike sample recoveries in the associated QC sample are outside QC limits; the result is an estimated value with no definitive bias.

NJ- The matrix spike sample recoveries in the associated QC sample are below QC limits; the result is an estimated value with a potential low bias.

Footnotes:

[b] Elevated detection limit due to dilution required for high interfering element.

[c] The ferrous iron test was analyzed after completion of Cr^{+6} testing (outside of normal hold times for this parameter) in order to provide more information about the possible impact of the sample matrix on Cr^{+6} recoveries.

[d] The sulfide screen test was analyzed after completion of Cr^{+6} testing (outside of normal hold times for this parameter) in order to provide more information about the possible impact of the sample matrix on Cr^{+6} recoveries.

[e] Analysis done out of holding time.

[f] Exceedance of Default Impact to Groundwater Soil Screening Level addressed by compliance averaging.

[g] Detection limit in excess of Default Impact to Groundwater Soil Screening Level; however the sample was collected within the saturated zone.

[1] NOTE: Soil Remediation Standards from June 2008 were incorporated in the May 2012 rule without change.

**- Nickel site specific impact due to groundwater screen level method calculated using SPLP laboratory methods

ft msl = feet mean sea level

ft bgs = feet below ground surface

mg/kg = milligram per kilogram

su = standard unit

mv = millivolts

Result exceeded the most stringent criteria
